grouped with Marie van Houtte, Mme. Laurette Messimy, and the most beautiful of hybrid tea and China roses—a happy marriage of flowers that form a background to the more formal beds of roses, one variety to each bed, with rockfoils and stonecrops hiding the bare soil. Over the pergola which runs by the side of this charming little rose garden are the most beautiful of climbing roses, clematises, jasmines, and the many rambling plants that are best placed against brick pillars and oaken cross beams.

There are roses everywhere, and in dewy mornings, before the sun shines full upon this grouping of flowers, a delicate fragrance fills the air, poured from a hundred expanding and open blooms, and the many flowers which fill the adjacent borders. Roses are a complete success, and this is the result of a sunny position and a well-made soil. A good foundation was laid at the beginning, and no expense spared to produce the strongest growth and finest blooms. We have never seen finer flowers of Marie van Houtte, which continue to open in perfect colouring from the early summer until the late autumn, when the sun seems to dye them with deeper shades.

ROSES AND LAVENDER.

On the left of the garden entrance a vigorous plant is shown trailing its way to the eaves, and it will surprise even the learned rosarian when he is told that the rose is Fortune's Yellow. It is on a south aspect, and was planted a little over three years ago; during this period it has succeeded in covering a space of 20ft. Hundreds of flowers are open at the time of writing. The beautiful shades of apricot and rose have made this one of the longed-for plants of the garden or greenhouse, in which it is usually planted. There must be many gardens in England in which Fortune's Yellow rose would succeed as well as in this favoured corner, and relieve the monotony of jasmine, clematis, and wistaria. It is necessary, as we have written before, to begin well, giving for Fortune's rose a soil composed of yellow loam and well-decayed cow-manure, with plenty of brick rubble to allow superfluous moisture to escape.

One of the charms of the modern garden is the planting of roses against tree stems, and where an old orchard exists of which the fruit is accounted of little consequence, no more beautiful way could be devised of growing the vigorous climbing varieties—Bennett's Seedling, Carmine Pillar, Crimson Rambler, Electra, Dundee Rambler, Paul's White, Mme. Alfred Carrière, and the lovely Penzance Briars, Amy Robsart and Anne of Geierstein, with foliage as fragrant as the common sweet briar. There is an old orchard of this description in the garden of which we are now thinking, and so successful has been the planting that it may be instructive to give the following hints: Before planting take out a hole on the best side of the tree about 3ft. square and 2ft. deep and fill it with good loam, some well-decayed manure, and road sand to lighten the soil. The soil round the plant should be slightly lower than the surroundings to prevent moisture from escaping, as without this precaution the roses would probably die. An orchard of roses is a fairyland of flowers, trails of bloom hanging from the leafy branches and lighting up the trees with a galaxy of colouring. Perhaps the rose may be the Crimson Rambler, and then is the tree aglow with the most vivid colour the rose can reveal. It is possible, with reasonable attention to pruning and watering, to achieve this result in three or four years.

The rose is grown in almost every conceivable way in this little garden—it is not more than one and a-half acres—and no picture is fairer in June than the Garland rose draping a sunny terrace wall. The warm white flower clusters are suggestive of a snow-drift; but to see the rose in perfect beauty one must be early astir in the garden, and catch the shell-pink colouring on the opening buds, which disappears as the sun expands them at midday. It is an old garden rose, but not eclipsed in effect by the newer kinds of recent years.

It is needful to live in this garden to catch the flowers of the seasons, from the opening of the first daffodils in the grass beneath the apple trees, to the misty blues of starwort late in September, and no other garden which we have yet visited has shown so well the charm of growing flowers in the wall. The wall gardens here, for such they may be called, are a paradise of little alpines from the mountains of Europe, and the experiments made with things usually confined to borders have proved most interesting and instructive. Early in the year the aubrietia and the alyssum are drifts of blue and yellow, and looking through the orchard to the walls, peeps of brilliant colouring break in here and there, sometimes amongst colonies of saxifrages, wild pinks, and stonecrops, which are as green as the grass in spring while winter still lingers. It is all very natural and inspiring, and we wish everyone with dreary wall spaces, without even a homely snapdragon to give them life, could see these walls of flowers, and

IN A BERKSHIRE GARDEN.

the astonishing beauty that the wise planting of the best kinds can give. Most of the plants were from seed and seedlings raised in a cold frame. The seed is mixed with soil, which is rammed into chinks and crevices in the wall, and sometimes a brick or stone may be removed here and there to let in the plant, but always make the roots perfectly secure in plenty of good soil to hasten fresh growth. A hundred rock and garden plants are grown in the terrace walls, and it is surely surprising that this means of growing certain flowers was not thought of generations ago. Object-lessons are provided on many a castle keep, where the wild carnation, and the crimson valerian hang in drifts from the crumbling stones.

Experimenting with plants in walls brings many surprises. The dainty little violetta pansy that we plant in the crevices of stone paving and as an edging to formal beds is quite happy in the wall, and the same may be written of the ordinary sweet violet, which grows with so great a vigour that severe restriction is necessary after the first year. Where the surrounding walls have to be considered it is frequently possible to grow the less rampant of the rambler roses, and to bring into use the foxglove, mullein, phlomis, and plants of larger growth than the little violas of the Alps. The enthusiastic gardener is generally the most successful, but in wall gardening enthusiasm is likely to lead to serious mistakes. Overplanting or grouping things of modest and vigorous growth does not always make for success, the stronger strangling the weaker. Week by week the wall gardens should be thoroughly inspected to discover whether the smaller plants, which are frequently the most beautiful, are undisturbed or weeds have found a foothold. Nothing will run more quickly to neglect than the wall garden, but nothing is more beautiful when in the hands of an intelligent gardener, who will in the evenings of hot days send a gentle spray of water over the plants to prevent scorching from the sun.

This, the first of the most interesting hardy flower gardens we hope to describe, is so complete, that not only are the borders arranged in the most beautiful harmonies of colour, but the small water space available is filled with the hybrid water-lilies, whose flowers, like floating jewels, open throughout the summer months, flowers of crimson, yellow, white, and lurid purplish hues which seem to glow in the midday sun. Gardening such as this presents few difficulties. The roses must be chosen with care, and in just the right colourings, so that no harsh or unpleasant association is possible; and when the rose-beds have pansies as an undergrowth, the closest attention must be paid to the selection, if an unhappy mixture is to be avoided. Think out the intended planting thoroughly, choose the best plants, give them a good start, and care for them afterwards—then will gardening not prove "love's labour lost."

GOLF: THE OPEN CHAMPIONSHIP.

THERE was a keen easterly wind which grew stronger, unlike most of its kind, towards the end of the day, and the greens, too, were very keen and slippery; still, it seems as if on that first day of the open championship some one or other of all the notable men in that very large field ought to have gone round the St. Andrews course, which all the critics have told us has grown easier and is so lacking in side hazards, in less than eighty strokes. Nobody did so. Obviously Taylor ought to have done it. His approach to the seventeenth hole, which he pitched (and thereby violated all the traditions which demand that this approach shall be run, and not pitched), was a shade too hard and went into the road. He took two to get out, took seven to the hole, and missed a putt on the last green. Therewith he was 80, and at that tied with Harry Vardon, who also missed a putt at the last hole, and with Herd and Walter Toogood. There were several at 81, including Braid, Massey, Sherlock, and young Reid from La Boulie. The best of the amateurs, by a long way, was Mr. Graham, at 82. The amateur champion was 90. So far none of these who were likely to be "in it" had done anything to put themselves out of it, nor were any of the best appreciably ahead of the others. The result was just as open as when the first shot was fired. One of the less famous of the players, whose score for the first round was 81, was Rowland Jones, professional to the Wimbledon Park Club, whose chief claim to fame is that he beat Taylor in the Walton Heath tournament a while ago There were only three men who could get round under 80 on the second day —Rowland Jones, who did 77; Braid with 78; and Kinnell, whose first round had been 82, with 79. The wind still blew keenly from the east, and the greens grew more and more keen and tricky. So Jones led at the end of the second round with a total of 158. Braid was next at 159. Massey, who had done 81 and 80, was equal third with Kinnell at 161. Of the four leaders at 80 on the first day, Vardon and Herd scored 82 each at their second venture, Toogood 83, and Taylor 85. Thomson was equal with the two former at 162, Gray equalled Toogood at 163, and Park, Williamson, and Sherlock were level with Taylor at 165. This was the position of the leaders at the beginning of the third day's play, when two rounds had to be played for the final decision. And of the amateurs only one was left even nominally in the running—within, that is to say, fifteen strokes of the leading man. This was Mr. Graham with a total of 167. It was a bad record for the amateurs, and a worse one than they ought to have made; but doubtless the conditions of play were very difficult. One begins to permit one's self just a suspicion of wonder whether on a very keen green there is so much virtue, after all, in the rubber-cored

DAVID CUTHBERT ON THE WAY TO THE 15th.

A DRIVE BY BRAID, THE WINNER.

ball. How would the old "Eclipse" have served the players under the circumstances? These, however, are but vain speculations.

The scores at this point rather indicated the ultimate result. Fine player as Jones is, one hardly expects, from a man of comparatively little experience in these big competitions, the unwearying steadiness that alone can lead to victory, and it was failure to keep absolutely steady, a visit to a bunker, with its result of slight demoralisation, that lost him the first place. His first round on the final day was 87, and it was much to his credit that with a round so bad as this in his score he could yet take equal second place with Taylor. His last round of 78 was a fine effort. Taylor, as has been seen, had put himself so far behind, by his 85 for his second round, that unless the leaders did something disastrous it was morally impossible for him to be first. He layed fine golf on the final day, but one of the leaders avoided disaster, so Taylor could not get near him, and James Braid for the second time is champion, and won with four strokes to spare. His first round on the last day, which was a better one for golf than its forerunners, put him into a very sound position. He finished in 78. In his last round he started poorly, with two fives, and had two bad holes at the fifteenth and sixteenth, visiting the railway at both, and taking six to each of them. With that exception his game was both far and sure, and a total of 81 made him an easy winner. It was a win well deserved and very popular. He was in his own county of Fife, for he learned the first lessons of his great game at Elie in the south of that so-called kingdom. It is his second win, for he was first at Muirfield in 1901. The score of 318 does not look well in comparison with Taylor's winning score of 309, when the championship was last played at St. Andrews; but the course was stretched to its very utmost, the east wind blew keenly and made putting on the greens, which were very fast after a long spell of dry weather, exceedingly "kittle" work, as the Scot calls it. Lovers of St. Andrews will be pleased that their course was not made to look too simple by a number of returns in the neighbourhood of 70, which had often been forecasted, and the forecast might not have been wrong had the weather conditions been different. As it is, the event shows that even in these days of golfing accuracy there is still a blessed element of uncertainty remaining in the game, even as played by the best.

Other prize winners were J. Kinnell with 324, and Massey and Gray with 325. Harry Vardon was 329, and White, last year's champion, 335; and not a single amateur returned a card for the total of the four rounds. It is a sad affair. Mr. John Ball, it is true, was not playing, but he seems to be hardly at his best, and his presence might have made no difference, for he is not a lover of the keen and "kittle" green. HORACE HUTCHINSON.

CORRESPONDENCE.

THE COLOUR OF BIRDS' EGGS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—In course of the correspondence on this interesting subject in your paper, one of the writers, signing himself "L. G.," mentions that he has often found nests in which one egg has been of distinctly paler hue than the others of the same clutch. This fact he has noticed in the clutches of several quite different species, and adds that it would be interesting to know whether this paler egg was the last or the first laid, if, indeed, any order was to be observed. It is a fact that I have not noticed, but have little doubt that further observation, which might easily be given, would show that the paler egg was the last laid, if any regular order at all was kept. And I infer this for this reason, that if you go on taking the eggs of any bird judiciously, so that it does not desert but continues to lay, the eggs become gradually paler and paler, as if the pigment cells were gradually exhausted. Of many species—the great spotted woodpecker is one—it is confidently asserted that the eggs of a second clutch, often laid in the same hole after the first has been taken, are always smaller than the first. With regard to the colour of cuckoo's eggs, the reason of the variation seems impossible to discover. All suggested hypotheses fail. It is the exception rather than the rule, in this country at least, that the egg has any resemblance to that of the bird in whose nest it is laid. Perhaps the most singular fact of all is that whereas hedge-sparrows' and redstarts' nests are about the most favourite resorts for the cuckoo to lay its eggs in, and whereas the eggs of both these kinds are blue, and of a very similar blue, the cuckoo's egg found in a redstart's nest is almost always of the same colour as that of the native eggs; but the cuckoo's egg in a hedge-sparrow's nest is hardly ever blue. In Southern Europe, where the nest of the Orphean warbler is, perhaps, the most favoured by the cuckoo, the egg of the interloper is almost always a copy, on a little larger scale, of that of the rightful owner. I am aware that Seebohm threw some doubt on these cuckoo's eggs in the Orphean warbler's nest, suggesting the possibility that they were a larger variety of the egg of the warbler itself; but I think the commonly-accepted view now is that they really are genuine cuckoo's eggs. Neither the "colour sensitiveness" theory nor the "protective colouring" theory suffices to account for the vagaries of the colour of cuckoo's eggs. It is not, indeed, clear that they give a very adequate account of the colouring of any eggs. The "protective colouring" theory means, of course, that the trend of natural selection tends to eliminate those birds that do not lay eggs that harmonise with their surroundings, so as to be inconspicuous. The "colour sensitiveness" theory is based on the idea that a bird that sees blue —*i.e.*, the blue sky overhead—while it is laying, will lay blue eggs; if spotty leaves intervene, then blue eggs with spots; if crossed twigs, then blue eggs with streaks; if it lays in the dark, then eggs with an absence of colour, *i.e.*, white eggs; and so on. It is supported by the experiments that show that animals which naturally change colour to match their surroundings, do not do so nearly as quickly when their eyes are covered as when they are open. But neither hypothesis is quite satisfactory. I may add that in the opinion of a very able naturalist indeed, the late Mr. Fergusson of Nairn, who had taken a vast amount of knowledge of oology at first hand from Nature, a certain disease of the ovary resulted in the laying of a blue egg by every kind of bird, no matter what the normal colour of its egg might be.—HORACE HUTCHINSON.

ARRIVAL OF THE MIGRANTS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Having seen the letter of "Lichen Grey" in your issue of May 20th, *re* arrival of the swallow, I am sending you a list of dates, kept since 1891, with the exception of 1898, when I was abroad, and 1899, when I was travelling. The last six years were all in Berkshire, the previous ones being divided between Yorkshire and Somerset:

	Swallow.		*Cuckoo.*		*Swallow.*		*Cuckoo.*
1891.	April 26	...	April 23	1900.	April 28	...	April 21
1892.	,, 25	...	,, 26	1901.	,, 19	...	,, 10
1893.	,, 25	...	,, 24	1902.	,, 13	...	,, 16
1894.	,, 26	...	,, 9	1903.	May 2	...	,, 28
1895.	,, 25	...	,, 26	1904.	,, 3	...	,, 16
1896.	,, 18	...	,, 21	1905.	April 12	...	,, 11
1897.	,, 26	...	,, 20				

You will observe that in most instances the cuckoo was in advance of the swallow, but the majority of my dates are later than those of your correspondent.—C. M. W.

NATURE NOTES.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—The following notes and remarks may be of interest. With reference to your paper on May 27th *re* the falling off in number of migrants, certainly in my neighbourhood of South Wales there is a great scarcity this year of spotted fly-catchers and redstarts, but such birds as chiffchaffs, willow, wood, grasshopper, and blackcap warblers are at least as plentiful as usual. Cuckoos and nightjars are also quite normal in number. Now as regards slugs. During this spring, on a small rockery 10yds. long and 8ft. high, over 350 were captured in a short time by means of half potatoes, hollowed out, and placed near the favourite food-plants, such as Iris pumila, Silene shafta, etc. Soot I find practically useless, as the first shower washes it away. To the list of birds mentioned (June 3rd) which feed upon slugs should be added the wood-pigeon. I have seen one of these birds on a lawn heavy with dew pick up over four dozen slugs. When examining the potatoes in the morning, a good and clean way of destroying the slugs is to drop them into a jug containing a strong solution of salt or permanganate of potash and water; in fact, I use the latter mixture for watering certain plants occasionally; it kills slugs, earthworms, etc., and cures the Iris family of its fungoid diseases in a short time. When destroying slugs, care should be taken not to kill those which have a small flat oval shell near their tails, these being carnivorous and not vegetarian, feeding upon earthworms, or, failing them, other slugs. This spring a wren, having just completed and lined with feathers her nest, was effectually evicted by a humble bee which took and kept possession. There have been a remarkable number of albino plants noticed this year, including Scilla nutans, Pedicularis sylvatica, Ajuga reptens, Vicia sepium, Veronica chamædrys and montana, Orchis mascula, maculata, morio, and others.—HORTIS.

BIRDS AT THE SCILLY ISLANDS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—May I be allowed to add a word or two to your interesting notes in the Summer Number of COUNTRY LIFE on the birds in the Scilly Islands? The gannet is mentioned there as a doubtful breeder on the islands. There can, I think, be no doubt whatever that the gannet does not breed there. Its most southerly breeding-place, I think, is Lundy Island, although in the winter it wanders down as far south as the Canary Islands, and is often in great numbers about Madeira. The frequency of the Great Northern diver off the islands of Scilly might have been mentioned. It is hardly possible at any time—except in their breeding season, when they are away in the North—to cross over from St. Mary's Island to Tresco without seeing several of these fine birds. A singular fact of bird-habit is to be observed any evening after the arrival of the shearwaters—that is to say, about Easter of this year. All along the Channel north of Annet Island they may be seen in very large numbers, all following each other in a single line of flight from south-east to north-west. Not a bird is ever to be seen moving in the opposite direction. Perhaps they are all making for some known roosting-place out in the sea, and perhaps at dawn they might be seen winging their way in the opposite direction; but the evening flight is watched more conveniently. The most notable ornithological finds ever made at Scilly are a specimen of the Kildeer plover and of the American bittern. Of the identity of these birds there is no question. Mr. Dorrien-Smith has both specimens stuffed at Tresco Abbey.—H.

THE RING-OUSEL.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—It would be interesting to know whether any observers have noticed a decrease of ring-ousels nesting this season. To-day I went over a favourite nesting-ground of theirs, where usually many pairs are to be met with, and saw no signs of a single bird. I noted the ring-ousels for the first time this year on April 3rd. A few days after there was a snowstorm almost unprecedented for the time of year, and so I am afraid this must have killed large numbers of the mountain blackbird.—SETON P. GORDON, F.Z.S.

BLACKBIRDS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I notice a correspondent, "W. L.," in your issue of May 6th, mentions that it is unusual for a blackbird to return to the same nest two years following. I only know of one instance, but that, I think, is sufficiently remarkable to be worth recording. A blackbird reared three broods in the same nest last year in the honeysuckle on one side of our house, and is now sitting on the third clutch of eggs this season in the old nest. I have noticed that after bringing each brood out into the world, she devotes herself to them for five or six days, after which she commences to lay the next batch, and the cock bird is left in charge of the young family. This year the second family left the nest on Monday, May 15th. The first egg of No. 3 was laid on Saturday, the 20th. She began to sit on Saturday, the 27th. At this rate there is time for four, or even five, broods this season.—Z. H. B., Bedford.

A CURIOUS MOUSE-TRAP.

[To the Editor of "Country Life."]

Sir,—This strange machine was bought at the sale of an old woman's belongings who was leaving the cottage, in an out-of-the-way village, where she and her ancestors, to the third and fourth generation, had lived their lives—lives uneventful as far as the world was concerned, but no doubt as full of interest to themselves as those of statesmen or travellers. The cottage contained some antique treasures, sufficient to attract quite a number of bidders, but few of them seemed to attach much importance to the roughly-made curiosity shown in the photograph, and, as far as the writer knows, it is unique. The former owner declares it was her grandmother's, and was always called "the mouse-trap," but that it had not been used for a very long time. If any of your readers can make out how such an apparently-simple device for the destruction of these household pests is set, first to entice, and secondly to capture, they will be more clever than—E. Broughton.

LANDRAILS SHAMMING DEAD.

[To the Editor of "Country Life."]

Sir,—There must be very good grounds for the repetition of the belief that the landrail, when frightened, feigns death. It appears in many books and is generally believed, but personally I have not met anyone who has seen them do this, unless perhaps on one occasion. We were shooting over dogs in Devonshire in September, in a field where patches of clover were left, though the field was partly mown. A setter was "roading" about, evidently after a landrail, and one of the guns presently stooped and picked the bird up, saying that he "saw it squatting." Perhaps it was shamming dead. Feigning death, though not uncommon among certain mammals, such as the American opossum, a small fox of the pampas in the Argentine, is rarely seen among birds, though instances have been known in which the bittern has done this, or something very like it, and been picked up for dead when only slightly wounded. Both the landrail and the water-rail, on the other hand, are very odd birds in another way. Instances are known showing that when captured they become tame in a few minutes and will feed readily. A few years ago a landrail was picked up in the road apparently injured. It was in reality suffering from paralysis of the legs, but seemed otherwise well. It was offered a fly when held in the hand, and readily took it. Later it was carried about and stretching out its neck would pick daddy-longs off the mown grass. It showed no fear at all, but died on the third day. Mr. G. Stevenson quotes a rather similar story about a water-rail taken by Mr. A. Newton at Elvedon in midwinter. Some soaked bread was put into its bill, and in a few minutes it began to pick bits of bread from his fingers. On his setting it down on the floor, with the saucer before it, it went fairly to work, and then soon made itself at home, running about the room, and showing great inquisitiveness. It examined every corner, tried to scramble into all sorts of impossible places, perched on the cross-rails of chairs, jumped up to the windows—when, of course, it was much surprised by the nature of glass—finishing every tour of inspection by a visit to the saucer, and now and then walking deliberately to the fireplace, where it shook its feathers and dozed, in evident enjoyment of the warmth. With all this, it only lived a short time.—Crex.

VEGETATION IN SOUTH RHODESIA.

[To the Editor of "Country Life."]

Sir,—South Rhodesia lies between the parallels of 16deg. and 22deg. in the Southern Hemisphere, and one would expect that the vegetation would correspond to that of India or the West Indies in the Northern Hemisphere. It is to be remembered, however, that the altitude of this country is about 4,000ft., and nowhere approaches the sea within 100 miles, so that the vegetation has more the characteristics of a subtropical region. In the lower lying portions of the country, it is true, one finds palms and plantains and forests with their interwined monkey ropes, which remind one of a more tropical region, as is the case at Umitali and South Melsetter on the Eastern boundary, and along the rivers which empty themselves into the Zambesi on the North. For the most part, however, the country is a breezy upland, with miles of grass-clad acres, dotted with trees of no great stature. It is in striking contrast to the Karoo veldt, where there are few trees and little vegetation beyond the Karoo bush, and it seems an ideal country for sheep pasture. The grasses are many and varied, and have already been collected to the number of seventy or eighty. When the long grass is kept down, a short and rapidly-spreading grass takes its place, and fine lawns, which would be the envy of any other colony in South Africa, are the result. But this note is written more with a view to showing what plants which have been introduced into the country have flourished. The native flowers which come up in such profusion at the end of the long spell of seven months' dry weather indicate that bulbous roots are common, and these are characteristic of the greatest part of the plants here. They take advantage of the succeeding five months of rain, either to form new bulbs or to increase the bulk of the old ones. In time some of the bulbs assume enormous proportions. One would expect that foreign bulbous plants would succeed here, and this is so. Dahlias, for example, grow exceedingly well, and it is common to see old rubbish-heaps that have been thrown out of gardens covered with dahlia blooms. Gladioli, too, of which there are one or two native specimens, grow in great luxuriance, and so also do gloxinias, begonias, liliums, and many others. Cannas can be grown in any quantity and to any state of perfection, and would produce seed sufficient for the whole of the gardens of Britain. Some foreign flowers have become veritable weeds. Cosmos, which succeeds only partially in the Colonies further south, is in full bloom in Salisbury in the present month (March), and grows all along the ditches, and over vacant stands, delighting the eye everywhere. The convolvulus, of which there are many native varieties, has become rather a nuisance, and the zinnia and tobacco plant are hard to keep under. This last fact indicates how tobacco grows in Rhodesia, and how likely it is soon to be a most valuable asset of the country. Rhodesian tobacco is finding favour all over South Africa. Very careful attention is paid to its culture, and good curing has already produced most valuable specimens, so that in a short time Rhodesian tobacco will appear on the London market.—Rhodesian.

THE GOOSANDER.

[To the Editor of "Country Life."]

Sir,—I am enclosing a photograph which, I think, will be of interest to your readers. It is a goosander's nest, which is very rarely found in Great Britain. The extraordinary thing about it is that there were two goosanders' eggs in it, one fresh, and the other probably last year's, and there were also two pheasants' eggs in it, which appeared fairly fresh. I found several old nests near by. When their haunt is visited at this season, the hen goosanders fly to and fro in large circles, uttering a soft quacking note. The favourite nesting site seems to be under a small clump of long overhanging heather, as I found several old nests in such situations. The goosander is an extremely quick flier.—Seton P. Gordon.

EDITORIAL NOTICE.

The Editor will be glad to consider any MSS., photographs, or sketches submitted to him, but they should be accompanied with stamped addressed envelopes for return if unsuitable. In case of loss or injury he cannot hold himself responsible for MSS., photographs, or sketches, and publication in COUNTRY LIFE *can alone be taken as evidence of acceptance. The name and address of the owner should be placed on the back of all pictures and MSS.*

The charge for Small Estate Announcements is 12*s. per inch per insertion, the minimum space being half an inch, approximately* 48 *words, for which the charge is* 6*s. per insertion. All Advertisements must be prepaid.*

THE . . . . FOURTH INTERNATIONAL . ORNITHOLOGICAL CONGRESS.

THERE be some who are inclined to look askance at Congresses, regarding them as a snare and a delusion: an excuse for junketings, and a rallying-place for amateurs and dilettanti. We do not share these views; on the contrary, we feel sure that they perform a great service in bringing together workers who have hitherto known one another only by proxy, so to speak—through the medium of scientific journals, or by personal correspondence. Certainly this is true of the Fourth International Ornithological Congress, which has just finished its session in London. Canada, America, France, Germany, Italy, Sweden, Hungary, Holland, and Belgium were all represented; and besides these, workers from all parts of the British Islands were brought together to renew old friendships and to form new. This in itself is a good thing, but many came who brought able papers for the kindly criticism of those who, feeling diffident as to their own work, were content to become good listeners.

First of all we must refer to the address of the President, Dr. R. Bowdler Sharpe. As this was of considerable length, he wisely refrained from reading it *in extenso;* instead, he gave a brief outline of its contents, which embraced two widely different topics—the birth and growth of the British Museum, with especial reference to the natural history department, and the question of geographical distribution, in so far as it concerns birds. The original collection in our State Museum contained some 1,100 specimens, not one of which now remained, for owing to the imperfect methods of preservation in vogue in those days, every single bird had fallen in pieces. From this small nucleus, Dr. Sharpe told us, the collection had steadily grown, till to-day it reached a number something over 400,000. This grand total, he pointed out, was the result largely of the generosity of private collectors, among whom the late Lord Tweeddale and Dr. F. P. Godman held foremost place. This address promises, when read in its entirety, to prove both extremely entertaining and a historical document of lasting importance. It is, we think, a matter for regret that more papers were not submitted on the work of museums with relation to ornithology. Dr. Dwight of New York contributed two extremely interesting papers on peculiarly difficult subjects—"The Significance of Sequence in Moults and Plumages," and "Some Phases of Wear in Feathers." These are subjects which promise to yield a rich harvest to the patient investigator, yet in this country they have received but scant attention, though many of our commonest native birds illustrate some of the more remarkable exceptions to the general rule of moults and the phases of immature dress. How many, for example, of our field ornithologists could describe the phases of plumage which the gannet alone passes through before attaining maturity? Yet there are persons who often indulge in the cheap amusement of sneering at what they are pleased to call the "Closet naturalist"!

Mr. J. E. Bonhote gave an admirable summary of the experiments he is conducting on the hybridisation of ducks, illustrated by lantern slides. Though too complex for the majority of his hearers to follow, when presented with the facts in the necessarily rapid survey he was compelled to give, yet all agreed that these experiments had yielded very substantial results. It now remains for Mr. Bonhote to bring his work into line with the recently-conducted experiments in "Mendelism." Or rather, perhaps, we should say, it remains to be seen how far Mr. Bonhote's work will support Mendel's theory, about which we shall have something to say shortly. The present writer also endeavoured to show the importance of the study of nestling birds with regard to the question of the evolution of this group. Bird protection very properly came in for its share of attention. This very difficult problem was discussed from many points of view. Mr. Frank Lemon gave a lucid summary of the ridiculous anomalies to be found in our present systems of legislation in his paper on "The Rationale of Bird Protection," which gave rise to considerable discussion. The very last act of the Congress, indeed, was concerned with this question of protection, inasmuch as the whole Congress, just before being dismissed, passed a resolution that a telegram should be sent to the Commonwealth of Australia urging that the nefarious traffic in penguin oil should at once be stopped. Not only are the petrels and penguins of the Auckland and Macquarie Islands in danger of being exterminated, but it has come to light that they are being done to death under circumstances of the most devilish cruelty, of a nature that seems too horrible to record in cold print. It is to be hoped that speedy measures will be taken to remedy the evil. For the first time, we believe, in the history of the Ornithological Congress "Aviculture" found a place in its deliberations, Mr. D. Seth Smith reading a most useful and instructive paper on "The Importance of Aviculture as an Aid to the Study of Ornithology." This was undoubtedly a valuable contribution to a most neglected subject. We are, indeed, thanks to the labours of a few ornithologists in this country, such as Mr. Seth Smith himself, Mr. Bonhote, Mr. Meade Waldo, and Drs. Butler and Creswell, slowly beginning to realise how much is to be learned by a careful study of birds in captivity. But, perhaps, the great feature of the Congress was the lecture by the Hon. Walter Rothschild on "Extinct and Vanishing Birds." This will long be remembered as a masterly exposition of a very difficult subject, illustrated in a manner absolutely unique in the history of ornithology. To hear this lecture the whole Congress was conveyed, by the generosity of Mr. Rothschild, by special train to his museum at Tring Park. Here, in a large hall, were gathered together a vast collection of birds either already extinct or on the way to become so, and these were inspected at the conclusion of the lecture. Among the more remarkable of these exhibits were skeletons of the Dinornis and Œpyornis, and stuffed examples of the rare Labrador duck, the black emu, and the starling of Reunion (Fregilupus), both of which have become extinct within recent times. The disappearance of the Labrador duck is involved in mystery. A few years ago it was a common bird in the American markets—so common that, of the few specimens preserved in the American Museum of Natural History, only one was obtained from a source other than this. Suddenly the market supply ceased, and enquiry showed that this fact was due to the very good and sufficient reason that there were no more Labrador ducks to be had! Of the dwarf black emu only two skins are known. The Californian condor and the ivory-billed woodpecker and laughing owl (Sceloglaux) were also represented here. If these birds have not ceased to exist, they are very near their end. The number of birds in danger of extermination is unfortunately a large one, and this was brought home with a painful suddenness by the specimens displayed here.

Our Portrait Illustration.

OUR frontispiece this week is a portrait of Miss Margaret Irby, daughter of the late Colonel Howard and Mrs. Irby. Miss Irby is engaged to be married to Sir Morgan Crofton, Bart., of Mohill Castle, Leitrim, who is at present serving in the 2nd Life Guards.

COUNTRY NOTES

IT is not possible to read an utterance of the Czar of Russia without feeling as if one had been listening to a voice from the Middle Ages—a voice sounding in a world where all else had grown discordant with it. "My will is the sovereign and unalterable will," he says with sublime egotism, to the deputation which waited on him to ask that a national assembly should be called. Yet in his condescension he is willing that this wish of the people, which has been carried out in every other civilised country, "the admission," he goes on to say, "of elected representatives to the works of the State will be regularly accomplished," and he was good enough to add "I watch every day and devote myself to this work." The Czar, as a matter of fact, is something in the nature of a puzzle to Christendom. At times he has shown himself capable of the most generous impulses, and has almost seemed a fitted potentate to lead a humanitarian crusade in Europe, but at other times the traditions of his office seem to overwhelm him, and he is unable to conceive of any limitation to his power. One would have thought that the experience gained during the war with Japan would have opened his eyes and those of his great officers of State. If these events do not succeed in producing such an effect just now, it may be taken for certain that they will accomplish something of the kind in the next generation. Russians of the future could not possibly grow up in the old childish belief in the omnipotence of the Czar and the untarnished superiority of the Russian arms.

The question above all others that has beaten scientific enquiry is that of the origin of life. Over and over again philosophers seem to be on the point of discovering it, only to find that they had been on the wrong tack, and that their labours had all to be begun over again. Of late there have been three possible theories. One was that life was a supernatural gift to the world, the objection to it being not that the supernatural was impossible, but that the divine force which ruled the world had in every other way worked by natural and intelligible means. The second theory was that of spontaneous generation, it being held that as the earth cooled it would gradually approach the condition in which life would come naturally. The objection to this was that chemistry, or science of any kind, had been unable to reproduce such conditions of heat and moisture as would lead to the appearance of the phenomenon of life. The third view, which was accepted by Lord Kelvin, was that life had been accidentally carried to this planet by some meteorite—a theory equally incapable of proof or disproof. This, roughly speaking, was the condition of the controversy with which the names of Tyndall, Huxley, Pasteur, Weismann, and others are inseparably associated.

Only the other day, however, a newspaper came out with the startling announcement—not conveyed in a casual paragraph, but in several columns of matter—that the origin of life had been actually discovered, sub-headings to the main title being "Momentous Discovery by an English Scientist" and "Spontaneous Generation." On examining the grounds on which this remarkable statement was made the enquirer was bound to be a little disappointed. It appears that Mr. John Butler Burke has been for some time engaged in experiments at the Cavendish Laboratory, Cambridge, and that by means of radium and sterilised bouillon placed together in a test tube he has succeeded in getting cultures "which present many of the appearances of vitality, such as growth and subdivision." We are afraid that the journalists who are responsible for this statement have exaggerated the position taken up by Mr. Burke himself, who, although he has obtained some remarkable results, does not draw such a very sweeping inference from them. In his own words, he says, "What has been done has suggested vitality. I do not put it higher than that." His idea is that from the point which has now been reached workers in the future may carry on the investigations, and may at some time—it may be a century or it may be thousands of years hence—find out the secret of how life came to the earth. It is a modest hope not by any means impossible of fulfilment, and it has the advantage of opening up a long vista to scientific investigators, at the end of which they may in imagination see the solution of the greatest mystery that exists at the present moment. But to go further than this would be rash indeed.

ACROSS THE CHANNEL.

The grey-green seas, the winds that blow
On misty cliffs and silted sand,
The English coast-line, bleak and low,
We quitted for a southern land.

For large white caps, straw-filled sabots,
Where blue seas break on a Breton strand;
For moated towns, and old chateaux
That over gleaming rivers stand.

For fishing fleets, the argosies
Of village wealth, that come and go,
Brown-sailed, before the sunset breeze;
For ox teams, pacing soft and slow.

And if you ask me which should please
The better, truth I scarce do know,
The misty cliffs, the grey-green seas,
Or foreign streets and old chateaux.

G. M. G.

Mr. Rider Haggard's report on the Salvation Army colonies in the United States is a document of the utmost importance to all who have the welfare of the country at heart. It will be remembered that the well-known novelist, who is also an acknowledged expert on the land question, was commissioned by Mr. Lyttelton on January 21st to "Report on the Salvation Army colonies in the United States and at Hadleigh, England, with Scheme of National Land Settlement." Before saying anything about Mr. Haggard's recommendations it may be as well to glance for a moment at his diagnosis of the disease which the State has attempted to cure. He has a dislike, almost amounting to horror, of the great towns that have swollen so enormously during the last quarter of a century. The poverty, sickness, and vices rampant in urban communities have impressed themselves indelibly on his mind. Corresponding with the aversion with which they filled him is his recognition of the fact that the English rural labourers are constantly migrating to towns. The reason he gives for this is that in a majority of cases village-born folk come to cities, and in many instances remain in them because they can find no opportunity to succeed upon the land.

In all this the commissioner is animated by the very sentiment that animated Sir Thomas Bernard and Mr. Wilberforce when, in the last half of the eighteenth century, they advocated the principle of allotments on the ground laid down by a witness before the House of Commons that "It keeps the cottagers buoyant and makes them industrious." Mr. Haggard's point, if we understand him rightly, is that the conditions of the present day render the cottager hopeless and despairing. He sees no outlet on the land, and therefore is ever ready to seize the first occasion to go to the city. In this, no doubt, there is a certain amount of truth, and on it is founded the desire for the creation of the small holdings and the multiplication of the allotments in Great Britain. But it is not an exhaustive statement. Owing to the modern education which is given not only by schools, but by facilities for cheap travel, the rustic has become much more intolerant of dulness than were his predecessors, and it is useless to deny that there are many thousands of them who would see no allurement in the country whatsoever the economic conditions might be. There is, however, a residue who would gladly escape from the sordid struggle of the towns, and it is for their benefit that Mr. Rider Haggard has outlined a scheme which we hope will find favour with the English people and their Government, as it has already received acceptance from President Roosevelt in the United States and from Sir Wilfrid Laurier.

This is a scheme for the emigration and establishment of the English indigent poor in our Colonies. As far as Canada is concerned it is evident that the utmost facilities will be afforded. The experiment has this in its favour, that on the whole it has proved a success in the United States, where three land colonies have been established by the Salvation Army, one at Fort Romie in California, one at Fort Amity in Colorado, and the third at Fort Herrick in Ohio. Mr. Haggard does not conceal the fact that certain mistakes have been made, as was inevitably to be expected, but he sees no reason for a

repetition of these if, with the benefit of the United States' experiment behind us, we should try the same thing in Canada. The slight financial drawback has been overcome, and at Fort Amity emigrants are flourishing now who were in indigence a few years ago. Mr. Haggard also states that the experiments "demonstrate in the case of Fort Romie that indigent people of the agricultural labouring class can be settled upon land and there do well, and in the case of Fort Amity that such persons can even be taken there at once and yet prosper."

Thus the ground would seem to be cleared for the commencement of the plan which Mr. Rider Haggard advocates. It should be mentioned that he puts it forward as a suggestion, and that it will no doubt be modified on examination and discussion. Indeed, the matter will require much closer investigation than he has yet been able to give it, as success will depend upon elements which are still undefinable. One of them is the situation of the land which the Canadian Government is willing to grant, and dependent upon this will be the cost of transportation from Great Britain to it. Then the price to be paid will have to be taken into account, and also the attitude of the municipalities, from whom Mr. Rider Haggard seems to expect a grant per head for carrying out the scheme. He would not confine its operation to Canada, or to any one colony, but is equally warm in his recommendation of Rhodesia and South Africa generally. As he farmed in that part of the world himself, and has a knowledge of the conditions that is almost unique, his recommendation in this respect is most valuable. But, as we have already hinted, the scheme will require to be put into concrete terms and placed before Parliament as a Bill to be debated by practical men before it can assume a workable shape. This we say in full recognition of the excellent work that has been accomplished by Mr. Rider Haggard. The country is very greatly indebted to him for the energy and business-like aptitude with which he has attacked this question and placed it so clearly before the British public.

Lord Westbury, speaking from the chair at the annual meeting of the Field Sports Protection and Encouragement Association, dwelt largely on the necessity of better legislation in the interest of the game preserver, and stated that the association was in communication with the Home Office with a view to the amendment of the law in this respect. The association works with the Game Egg Guild in strenuous effort to prevent the sale of stolen eggs, but the stealing is often difficult to prove. In a case, not mentioned at the meeting, of an offender recently caught with a large number of eggs in his cart, his defence was that all were taken from his own land; and though the statement implied an abnormal prodigality in laying of the partridges it was a difficult defence to rebut. We mention this as indicative of the trouble of getting convictions against clever offenders. It is well known that English eggs are sometimes transported across the Channel and reshipped to be sold as foreign eggs. That more extended right of search into consignments of eggs and game should be given the police is one of the desirable amendments to which the association is turning its attention.

The brook garden, or pond garden, through which the waters of the Serpentine run before they disappear underground on their way to the Buckingham Palace lake, is the prettiest and freshest piece of outdoor scenery in London at the present moment. The heavy rains have freshened up the water, and have done no harm to the fine water-side plants, whose tall stems and bold leaves and flowers fringe the margin, while the slope of turf behind is like bright green velvet, only greener. There is a cascade at the top, and all the length of the pool is in gentle motion; but that does not prevent a generous growth of water-weeds, especially duckweed, and green confervæ, such as gold-fish and other carp and little wild ducks and young water-hens love. Water-lilies abound there, too, and by the banks grow clumps of Osmunda fern and yellow iris, and giant hemlock, foxglove, and campanula, while at the back are bushes of wild rose.

On the waters within this fresh and beautiful setting are several broods of young wildfowl of different growths, which may be watched on their native element behaving as confidently as if on the remotest Norfolk mere. A mother wild duck, with a family of ten ducklings only a few weeks old, has evidently not quite lost her misgivings that they can be too much in evidence. As a rule she sets a good example by coasting along near the bank, under the tunnel made by drooping Osmunda and giant leaves of hemlocks and butter-burrs. But the tiny flock of downy infants are so intent on foraging and so active that they dash out in all directions over the water, catching flies and dabbling in the weeds. A water-lily leaf often serves them in place of a raft, on which they stand and preen their down, for not one has a feather. At least two broods of little black water-hens, also still covered with down, are to be seen, and it is said that some dabchicks are also there. The water-hens do not keep together like the ducklings, but scatter over the pool, where they feed and dive independently. The old birds are so tame that they even settle down to wash their feathers in public. On Monday last a young turtle-dove was flying round the pool. Possibly another such garden might be made near the old spring below Kensington Palace.

Midsummmer is by far the best time of year for finding the various kinds of wild orchis, which are as quaint and beautiful in their way as any of the exotic species. They are chiefly to be found in hayfields and among the short natural hay crop of the hills and downs, especially on a chalk or limestone soil. But some of them, like the fantastic butterfly, prefer a shady though open woodland, and the curious fleshy Bird's-nest grows on the bare earth under beeches. The sweetest-scented species are the butterfly and the graceful purple fragrant orchis, the latter being found in hayfields, often in company with the queer green frog. But chalk downs are the best place of all, and very many of the most distinctive, as well as the rarest, species are to be found among their late June flora. They range from the pyramidal, with its stiff Dutch growth, to the beautiful bee, which so remarkably resembles a spike of pink star-like blossoms with a brown bumble-bee settled upon each. It was the bee orchis which drew from Darwin the wish that he could live for a few thousand years in order to see whether, as he believed likely, the flower would eventually die out. For the blossoms are self-fertilised, instead of being cross-fertilised by insects, which method of reproduction has been proved by the great majority of kindred species to be the most successful method in the struggle for existence.

CAMBRIDGE.

There is a city growing very old,
Yet always full of voices very young
A city whose grey glories are wide-flung
Against a sky all silver, blue and gold.
Not half this city's history is told,
Not half her pride and beauty have been sung—
The river, by its silver spans o'erhung,
Knows more than speech or writing can unfold.

The noisy clamours beat against her peace,
But cannot break it; it is held too dear
By hearts across the desert and the deep;
And when the careless voices lightly cease,
Beneath the Gate of Honour one can hear
The dusty centuries whisper in their sleep.

H. PEARL HUMPHRY.

We are now in a position to form a fairly accurate estimate of the fruit crop of the year, and it is matter for regret that nothing but a low one is possible. The extreme cold in the early part of spring, followed as it was by the drought, that brought with it heat by day and a chill at night, have proved inimical to most kinds of English fruit, while the rain arrived somewhat too late to remedy the defect. That favourite fruit the strawberry has perhaps suffered less than others, though, if we are to judge by the prices obtained for the first large consignments from Kent to Covent Garden Market, it does not promise to be cheap this year. The early gooseberries and other bush products, both in quality and in quantity, are rather below the average. If we take the fruit-growing counties in detail we shall find these general conclusions admirably borne out. In Kent the strawberries are plentiful, but they are the only fairly good crop. Almost the same report comes from Hampshire. In Herefordshire, the great cider county, apples are going to be scarce, and plums are below the average, while nearly all the bush fruits are poor. In Cambridgeshire not more than a half crop is promised, and here, as in other parts of East Anglia, the London population of fruit-pickers appears likely to lose its employment this year, though the railway companies had made arrangements to run special trains from the large towns in the neighbourhood, so that there would be no need to accommodate the casual labour as usual. In Worcestershire plums are expected to be a short crop, and plums, we need scarcely say, are the speciality of that county. Apples and pears in Somersetshire were very much injured by the early frosts, but the smaller fruits have done very much better than in some of the other counties. From Scotland we hear very bad reports, cold and drought having practically ruined the crop.

The experiment of opening for some hours on Sunday the New Art Galleries at Glasgow has now had two Sabbath days' trials, and it appears that the really rather courageous step of the Town Council is assured of popular favour. It may be said that the direction of the wind of popular opinion in this regard had been already tested by taking a plebescite of the municipality, but some ultra-Conservatives ventured to express much doubt whether it represented correctly the feeling of the town. Even at

the first opening, however, the gallery quickly became filled by an appreciative assembly, and the second Sabbath opening proved that the novelty was not the only attraction. This Sunday opening is in very large measure due to the efforts, continued for the last quarter of a century and only now crowned with success, of a society instituted in Glasgow with this special object. It is not at all wonderful that it met with much opposition, and, indeed, the surprise perhaps is rather that in a city where the Sabbath is observed with so great a strictness, a majority should favour the opening of the galleries. It is a sign of the times at which the liberal-minded will rejoice, for even those of the strictest sect must admit that some hours of the best of days may be spent in worse places than picture galleries.

———

Lord Roberts has made an appeal, through the columns of a contemporary, for some form of compulsory national education in rifle-shooting, and amongst other interesting letters that it has elicited is one from Sir A. Conan Doyle, which has, with other merits, that of making a practical suggestion as to a way in which the result might be attained without hurting the sensibilities of those who may be tempted to see in the proposal the first germs of compulsory service. After giving high testimony, from personal experience, to the value of training at miniature rifle ranges, Sir A. Conan Doyle goes on to propose the virtual reinstitution of the parish "butts," in form of a miniature rifle range, which it shall be legally compulsory on each parish council to establish for its own parishioners, and puts forward the further tentative suggestion that it shall be made compulsory for each adult to practise at the butts with the 200 rounds a head which he proposes shall be provided at the public cost. This, as he justly says, "is surely the very smallest demand that any country in Europe makes on its citizens."

UNWRITTEN COUNTRY MEMORIALS.

ANYONE who is very familiar with the country-side must have noticed a thousand things that are not written down in any guide-book or history, but which seem to give suggestive hints of the previous generations who inhabited the districts. For example, there is a river in the North with which the writer is very familiar, and at one point in it, on a fine summer day when the water is clear, may be seen a row of great stones stretching from one bank to the other, showing certainly that it was once upon a time crossed by a bridge; yet no memorial of the structure has been discovered, although on the further bank of the stream there is still in the midst of a grass field an avenue of elms leading to the ruins of an ancient castle, which shows that at one time there must have been a high-road from the river. Yet every vestige of it on the hither side has disappeared. The ground has been dug up in search of some traces of the foundations of a road, but nothing has been discovered. It is as though the avenue led simply to the river and across the bridge and everything ended. Of course it did not end there. Probably there was some rough track leading to the great Roman road, the nearest point of which is only a couple of miles away. On the same stream there are at frequent intervals bits of wall that evidently belonged to old mills; yet the mills have all been destroyed, and nothing is left to tell the tale. One especially is approachable only by a bridle-path, and must have been in use at the time when it was customary to convey corn to the mill on horseback. It could not have been of much use later, because the bank of the river at that place is so wild and rocky that we cannot imagine that carts ever got near it. Here, then, we have evidences of activity that has long given place to stillness. Here, no doubt, in bygone ages, the miller in his dusty white clothes received the corn from the various small holders who lived in the neighbourhood, and took for his payment the multure or moutter, as it was locally called, which in some cases was what the Scotch call a "gowpen," or as much as he could hold in his hand, and this reminds us of the many evidences to be found of the tiny steadings that once were scattered all over the country: little houses with a stable and a byre attached, set in the midst of a piece of land or a garden, where successive yeomen sowed and reaped and harvested, mended their roofs and drained their fields till, in the words of an epitaph that was copied by Bewick, "Good times, bad times, and all times were got over." Even the last remnant of the walls of these houses has, in nearly every case, now disappeared, and only a snowdrop or a crocus coming out in spring tells where the garden once was. But often in deep ploughing or digging, the husbandman will strike what were the foundations of the house, and a little investigation is then sufficient to show what the old place was like. Many thousands of these holdings must have disappeared during the last 100 years—practically speaking, as soon as the Enclosure Acts were passed and that right of free pasture which made living possible for them was forfeited. It is very curious, for in several of these houses, now vanished, people of consequence died, and their names are to be found in histories, though only the locality where they lived can be given. These evidences point to the fact that a much greater population used to subsist in the villages than they are now capable of supporting, and this is fully borne out by the amount of church accommodation, which has evidently been provided on a scale that would seem extravagant

Copyright WILLOWS BY THE WATER. "COUNTRY LIFE."

to the inhabitants to-day. Here and there, too, we come across the ruins of a church in the country that has been wholly disused. One small structure of this kind we know of in Gloucestershire, where in summer the churchyard and all that surrounds it are smothered by weeds bearing brilliant flowers and almost as high as a man's waist. Only in winter can you see mouldering heaps where the rustics of long ago were buried. The roof of the church has fallen in, and only the bare walls remain to tell where the House of God once resounded every Sunday to the voices of the choir and the musical instruments of the band. These memorials, however, are so bold and strong that none could mistake them. There are others which it requires far more skill and care to read. For example, we take such common objects of the country as trees. Frequently the owner of a house will take a visitor into his grounds, and show with pride some uncommonly tall and stately oak that is the glory of the estate. He may attribute its uncommon height and size to the goodness of his land, or to some other cause of the same kind. But in forestry we know for certain, first, that if a tree is left to grow by itself it tends to make a short stem and a great broad spherical head; second, that if crowded by other trees which shut out the sun, it will climb upward towards the light, and thus form a long straight stem. Therefore, the existence of such a tree standing by itself affords proof positive that at one time it was part of a woodland, which was probably cut down to facilitate some builders' operations. The existence of pollarded trees in many of our forests points to one of two things in the past. Either those who possessed the rights of common were entitled to lop the trees for firewood, or the place was the haunt of predatory gipsies, who were in the habit of maiming the trees in order to make fuel for their tents. We see sometimes, too, proofs of old systems of forestry. One of these was in use with beeches, and it was to cut down the trees at intervals and leave only one or two mother trees, from whose produce sprung up seedlings which reafforested the land again. Of course this practice is against all that modern forestry teaches, but in some cases the mother trees have been left to show what used to be done in former times. Trees, again, often grew in places where we should not naturally expect them, as where rows of them are to be found across a meadow. These point unmistakably to the fact that at the place where they are there must have been a boundary fence, and the discovery of this has more than once proved useful in cases of litigation. And this brings us to another branch of the subject—namely, the many curious remains that exist to show where roadways were that have long been disused. Sometimes they now take the form of a long, narrow meadow, and the little blades of grass, which conquer all things if they have time, have destroyed all vestige of the road-maker's art, and left the place like a meadow, though the hedges on either side, the stiles at the end, and the right of way through the narrow field point an unerring finger to a time when it was one of the common high roads of the country. Some of these highways were no doubt deliberately put aside in favour of more direct or more even tracks, but some have passed into oblivion from mere disuse, and in the latter class we place the famous tracks and roads of the Romans and ancient Britons, such as that beautiful road which still traverses the Berkshire Downs, leading all the way from Bristol to Reading. Along these the early Briton probably passed in his war chariot, and fat beeves were driven for the Roman soldiery, while Dane and Saxon and Norman made use of them later, because in those old times, when drainage was scarcely known, the crests of the hills provided a dry foothold. Our early forefathers, by the by, seem to have had a romantic interest in the summits of the high hills, for on so many of them are to be found great cairns or piles of stones that must have been gathered and put into position in days of yore. Indeed, in the majority of cases, some practical purpose was served, such as that of providing a place for a beacon or a signalling station, while it is just possible that high and remote places of this kind were chosen of old by Druid priests for their places of worship. That was very likely to be the case when the legions of Rome had obtained the supremacy, and the ancient inhabitants of this country were only allowed on sufferance. We find it difficult, even with all the discoveries of recent times, to realise for how many generations the Romans made of England a place of residence. Yet, if we take such a place as Chedworth Villa in Gloucestershire we can find curious proof of the length of their stay. It is a very perfect example of a Roman villa, and contains, amongst other things, a complete bath, the stone leading down to which is deeply worn by the tread of bare feet.

How many generations must have bathed there before the stone could be worn away! and there is something of pathos and romance in the reflection that for several hundreds of years the place was buried by the grains of sand and blades of grass. It was only discovered accidentally during the last century, owing to the fact that a man who was ferreting rabbits lost his ferret, and in digging came across the stones of this unique building. And if we take life after the Roman period in Great Britain, it is most interesting to study the country memorials of that Feudal System which was established later. We find traces of it in the very names which prevail in some districts. Northfield and Eastfield, and Waste and Common—these, and many others, are terms of frequent use in the manorial system, and where they are in existence the observer may soon trace out for himself the evidences of Outfield and Infield, and the other arrangements of the time. He can identify them with the more certainty because the system endured in many places to a very late date indeed, and near to London land is still cultivated on it, so that the living present may be compared with the memorials of the past, and a mental picture formed of the rural England which has passed away.

The previous history of agriculture can, to a great extent, be deciphered from a study of the land. We take, for instance, the furrow marks that still can be seen on what has long relapsed into wild downland, which the farmer of to-day would no more think of ploughing than of attempting to fly to the moon. The length of time that furrow marks will endure has long been a subject of controversy. There are parts of Salisbury Plain which still show furrows, and which are said not to have been ploughed for at least a thousand years. But we do not need to go so far into antiquity to account for the furrows on downs. Most of them were made during the Peninsular War, when the prices of cereals were extraordinarily high, and a kind of wheat fever seized upon the estate-owners and farmers of Great Britain. In those days they cultivated every bit of land which could possibly be utilised for the growing of wheat, and the waste was stubbed, the marsh drained, and the very hilltops ploughed to increase the acreage of that crop. After a time, of course, the inflated prices went down, and on account of the small harvests obtainable from these places which had been hastily reclaimed it was not found profitable to go to the expense of tilling them, so that gradually and quietly the land relapsed once more into mere waste and moorland, and some of it into permanent pasture. But the furrows remain to this day to show those who can read it in them the story of the time of the great wheat fever. These were the days, too, when the great tithe-barns, of which we have often shown photographs in these pages, were in full use; but, which, after the Commutation Act was passed, in 1837, began to be devoted to other purposes, and the barn of to-day does not in the slightest degree resemble that of our forefathers, any more than the home-teads built in the twentieth century resemble those which were scattered over England when the stage-coaches were running. Travellers tell us that the little steadings were nearly all thatched, and very different they must have looked. But the enclosure of the commons rendered the life of the small farmer unendurable, and the tiny holdings gradually lapsed into the great estates.

It is a great jump from the hilltop to the seaside, but in various parts of the country memorials of a state of things which has long ceased to prevail are still existing. The enormous caves will serve as an example. A considerable proportion of them are natural, and were utilised just as they stood; but those who were engaged in the exciting business of defrauding the revenue often found it to their interest to devote a great deal of time and labour to the widening, extending, and improving of these caves. In one place that we know of, on the coast of Berwickshire, a passage has been excavated through the solid rock into a maze of caves, where the smuggler used to ply his trade during the last century. Tradition says that the kegs of spirit, when a descent was made by the revenue officers, were very often carried out to sea and sunk, with a small float to locate them, so that apprehension was almost impossible. We remember once while walking on the Ochil Hills in the South of Scotland coming across a rabbit-hole, the sides of which were covered with soot like a chimney. On investigation this proved to be the outlet to a secret still where whisky had been illicitly manufactured, and sold in secret to the rustics.

THE BARTON BY THE RIVER.

Such are a few brief hints as to the records of the past that may be read by observant eyes in rural England. But it should not be forgotten that every district has its own peculiar history, and what is true of one place need not necessarily be true of another. What we are sure of, however, is that many and diverse have been the generations that have lived and passed over English land, and finally gone down to the dust. It is a pathetic task to try to bring them back to life again by force of the imagination, yet nothing could possibly be more interesting, even though it carries with it the mournful reflection that in a little time we, too, who with curious eyes look before and after, will follow our fathers and take our place in that oblivion which is the ultimate lot of us all.

A BOOK OF THE WEEK.

FOR some little time past there has been a considerable amount of chatter in the newspapers about what is called the simple life. Not everyone who reads is aware that the cry is one which has been reiterated from time to time since ever the civilisation of man came into history. The hermits and recluses of the Early and Middle Ages, by their action, offered a silent protest against the complexity and the luxuries of the life of their times; and religious teachers of various forms of thought have again and again formulated doctrines enjoining simplicity on their followers. Towards the middle of the last century there was a very notable development of this taste for simplicity. It found remarkable expression in the philansterists who started a colony in America where every man was supposed to do his own work and lead a simple and uncomplicated life. Even the highest intellects of the time were infected by enthusiasm over this idea. At one period Thomas Carlyle and Froude meditated a project for carrying an axe to the backwoods of America and living as working men. Ruskin gave fantastic expression to the same notion when he induced the Oxford undergraduates to go out road-making. Of those who have preached the doctrine of simplicity with most success it is undoubted that Thoreau takes the first place, and he was not only a preacher, but a practiser of his own teachings, and in the woods of Walden did really lead a simple life. Whether it was altogether good or not is, however, a matter of dispute. Robert Lewis Stevenson, who can scarcely be called an unsympathetic student of Thoreau, came to the conclusion that he was a skulker, that is, one who shirked the hard fight of the world. For it is very often forgotten that, after all, simplicity is not an object in itself. Living is the real object, simplicity only the method. This consideration does not seem to have been present in the mind of Mr. Charles Wagner, whose book, *The Simple Life* (Isbister and Co.), is responsible for much of the present discussion. He is an Alsatian who is described as a shepherd from the hill country, his birthplace being a hamlet of the Vosges, between the rich fields of Burgundy and the fertile plains of Lorraine. But we are less concerned with the man himself than with the form of doctrine he sets forth, and while by no means agreeing fully with what he says, we readily admit that much is worthy of the closest attention. The real difficulty is to separate the practicable from the impracticable. There is scarcely one man in 10,000 who would not readily admit, if put to the question, that modern life is too complex, that is to say, he would admit it in an abstract and general manner. But if the enquirer took the individual and particular life, and suggested changes that might be made in it, he would probably meet with a very different response. Mr. Wagner begins his sermons by a dissertation on what he calls "The Essence of Simplicity," and rightly enough says "Simplicity is a state of mind." For our own part, we hold that simplicity, if it does not depend upon clearness, is closely associated with that quality. As soon as anything can be seen lucidly it can also be dealt with simply. But suppose we apply this axiom to thought, we at once find ourselves confronted by complications. Our author says, "Have confidence and hope; be kind," but the difficulty arises when we ask, as ask we must, in what shall we have confidence, wherein lies our hope, what result will be achieved by kindness? These are the considerations that set a man brooding over the mysteries of existence, and complicate his thinking in spite of himself, and to preach to such an one simplicity seems to us a vain and useless thing. His thinking does not depend on his will, but on his mind. No one can will to think that six and four make eleven; his mind would say ten, despite his will, and so it is with the innumerable facts that face us in existence. The mind arrives at a conclusion in regard to them by its own action, and no exercise of will-power on our part can possibly make the slightest difference. Simplicity of speech must, to a large extent, depend on lucidity of thought. Expression is really dependent, for the most part, upon mastery. A problem that has been thoroughly mastered can generally be stated in simple terms; it is while we are groping in the midst of difficulties that we are tempted to fall into complexity of speech, and few will agree with our author that habits of public and private speech and writing are tending to exaggeration. On the contrary, in every department of life, whatever is pompous and ceremonious is repugnant to the modern temperament, and so far as speech goes, we are undoubtedly progressing towards simplicity.

Ooccasionally the author only repeats at greater lengths truths that were thundered out by Carlyle, as in the following instance. The passage we quote might be taken as a kind of paraphrase of the well-known saying of Carlyle: "Do that duty which lies nearest to thee; the second will become nearer doabler":

"Again, the plain duty is the near duty. A very common weakness keeps many people from finding what is near them interesting; they see that only on its paltry side. The distant, on the contrary, draws and fascinates them. In this way a fabulous amount of goodwill is wasted. People burn with ardour for humanity, for the public good, for righting distant wrongs; they walk through life, their eyes fixed on marvellous sights along the horizon, treading meanwhile on the feet of passers-by, or jostling them without being aware of their existence."

We come to something more practical when we approach the question of eating, sleeping, drinking, and clothing. Mr. Wagner speaks from a high mountain-top as it were; but suppose he were to descend, it would be found that he can address his fellows with much common-sense and persuasion. Over-eating as much as, and perhaps even more than, over-drinking is a frequent cause of misery, and to put it on no higher ground, the material happiness of many of us would be increased if we resolved to confine our food to certain plain and simple dishes—of that there can scarcely be any doubt. So in regard to sleep. There is no luxury that gives satisfaction and pleasure equal to a sound sleep, yet anyone who overdoes it will soon find that the bitterest hours are those he spends in bed. It is more rational to take only the amount of sleep required, and to prepare the body for it by a moderate diet and wholesome exercise. There can be no disagreement with our author when he writes as follows:

"He who lives to eat, drink, sleep, dress, take his walk—in short, pamper himself all that he can—be it the courtier basking in the sun, the drunken labourer, the commoner serving his belly, the woman absorbed in her toilettes, the profligate of low estate or high, or simply the ordinary pleasure-lover, a 'good fellow,' but too obedient to material needs—that man or woman is on the downward way of desire, and the descent is fatal."

With his declamation against the mercenary spirit of the age we are always in agreement, though he leaves out of consideration that the love of doing good work—the spirit of the artist—is the counterbalance to this evil. It is not good that a man should do work merely for money, though when he does work for love of it it is only just that he should obtain a due reward. And in regard to notoriety and subjects of that kind, the only objection we can take to Mr. Wagner is that he deals somewhat strenuously with the obvious. Few intelligent human beings would attempt to defend the love of notoriety.

THE WYE IN MAY.

THE valley of the Wye and the forest of Dean are quite at their loveliest now, for the trees are just in their first beauty. The oaks and the elms are not in their full foliage yet, but who can describe the tender tint of the yellow and green of the half-unfolded leaves, only partly veiling the mossy and gnarled trunks? Under the Wyndcliff and along all the wooded curves of the Wye the delicate sheeny foliage of the beeches shines out against the background of dark fir. Here and there a copper beech glows rich in the May sunshine. In a few days the chestnuts will be holding up their snowy fingers. The wild cherries have not yet dropped all their bloom, and in the orchards of great houses and in the humbler gardens the apple and pear trees show a wealth of white and pink.

Old May Day could be a very feast of flowers. Park and field are yellow with cowslips and buttercups, wood and holt gay with bluebells and anemones, the hedgerow banks full of primroses, ragged robin, herb-robert, and wild onion, which, if malodorous, is yet sweet to look at, and the luxuriant wallflowers brightly decorate the grey stones of many a castle ruin and church wall.

From Hereford to Chepstow the world seems full of cuckoos, that answer one another from field to field, the deep trill of the nightingale wells forth all day long from thicket after thicket, the plovers scream loudly over the Golden Valley, the magpies make merry in the roofless nave of Tintere.

All day long for a week now the bright sun has shone down, well pleased, on all this loveliness, and the cool breeze from the north-east blows fresh and strong. Clear light and keen air give a distinctness to the view and a freshness to the atmosphere that seem to make one understand how all this border-land beneath the Black Mountains was once the home of Keltic poetry. The bard of the Mabinogion was nothing if not clear-sighted and fresh of soul. He must see the imaged vision distinctly in all its brightness, he must distinguish the colours, he must name them, he must feel the breeze, and taste the salt of the sea and the flavour of the mead. His heroine's hair must be "yellow as the broom," and her skin fairer than the blossoms of the wood-anemone beside the spray of the fountain. Coal-black horses, brindled white-breasted greyhounds sporting like sea-swallows, spears of an edge to wound the wind, swords of the hue of the lightning of heaven, robes of flame-coloured silk, "arms of speckled yellow, variegated with Spanish laton!" Such are the furniture of the ancient bard. The imagination runs riot through fairyland. The tale-teller revels in miracle. One is surfeited with wonders. Yet there is nothing confused or indistinct. Men, women, palaces, animals stand out clear, and having dismissed from our mind the ordinary canons of probability, we may accept the things of fairyland, and visualise them as things in our own streets. "The left shoulder of the horse was of bright red, and its right leg from the chest to the hollow of the hoof was pure white." Could anything be more exact? Could a horse-dealer be more explicit? Surely it was this clear springtide air, this fresh luxuriance of natural beauty pouring itself forth in such a varied flood of colour and life that were responsible for something of this spirit of the Kelt, just as the lonely mountains and stony fastnesses were for the sadder and more melancholy side of his poetry.

I am writing with the Severn and the Wye both in view, and there is something very striking in the contrast between the broad majestic flow of the one

and ever-curving rapidity of the other. They were, no doubt, lover and beloved in old legend, the eternal contrast between male and female, the slow deep purpose of man, the variety, the impulsiveness, the loveliness of woman. The two little runnels that come forth from the flanks of Plynlimmon part asunder so widely, encircle so many acres, and at last draw together again, and mingle in one stream by St. Tecla's hermitage—do you not see what they symbolise? A romance indeed. "Two children in two neighbour villages." They pass their childhood side by side, perhaps they dream of a long life together; but it is not to be, for that would not be romance. No! there is the sad parting, and they go their several ways through the world, and as years pass on their footsteps ever grow closer again—he, grandly magnificent, bends slowly round towards her; she, ready to do the wooing—with a certain coyness, of course—keeps coming almost into his path, and then with a graceful curtsy hastes away again only to return. And so for week after week, month after month, until at last after one more feint she rushes right into his arms—at St. Tecla's Church—and they are made one in the Indian summer, and together journey on through a broader, nobler life; so onwards to the sea. It is a pretty fancy, and no doubt is to be found at full length in some West Country poet or Welsh bard. The outline of it given will show the influence of the Wye country on the imagination, and the power of the springtime. Rivers, forests, meadows, and gardens are beseeching the town-dweller to leave his toil and see visions and dream dreams. Ruined castle and abbey are still and deserted, inhabited only of their own spirit. The Border country speaks more eloquently to us when we do not come in crowds. And she is never so fair of speech as in the month of May.

W. J. FERRAR.

GOAT-FARMING: A NEW INDUSTRY.

Copyright *GOING HOME.* "COUNTRY LIFE."

IT is a constant source of wonder to the few amateur goat-breeders in England that such a profitable industry as goat-farming has never been taken up on a large scale in agricultural districts. The Encyclopædia Britannica, under the head of "Goats," states: "Comparatively few are kept in England, because the advantages of goat-keeping are very imperfectly known." In this, therefore, as in many other cases, ignorance and prejudice seem responsible for the small attention paid to this interesting and productive little animal up to the present. The fact that goats' milk stands alone in being absolutely free from tuberculosis ought to be sufficient to attract the attention of all civilised countries, especially when cows' milk is known to be so full of tubercles that at the Pasteur Institute in Paris, December, 1900, Dr. Henri de Rothschild declared that, out of 450,000 quarts of milk consumed daily, 431,250 were found to be contaminated.

Goats are traced as far back as the history of the world, and in mythology this animal played a very important part. In the Greek legend the goat is Jupiter's nurse, her hair is used to weave the curtain of the temple, and she has a place in astronomy. Up to about twenty-five years ago the goat, commonly called "the poor man's cow," seems to have fallen absolutely beneath contempt, and was only kept by poor villagers in mountainous districts, who never took the slightest care of them, let them inbreed at their own free will, and so some beautiful varieties are now almost extinct. During the last quarter of a century some special efforts to bring forth the merits of these animals have been started in almost every part of the world. The Société Nationale d'Acclimatation de France was founded some twenty-seven years ago, and was quickly followed by the British Goat Society, which has done so much good in endeavouring to bring before the public the value of goat-keeping; still, goat-farming as an English industry is not practised on the same lines and to the same extent as by our American neighbours. To give one example only, we will mention California, practically a new country, which, having in 1897 200,000 goats, has now increased that number to such an extent that in 1903 she had as many goats as sheep. In America the goats are not only valued for the milk, butter, and cheese they produce, but also for their skins, which to the number of 60,000,000, and the value of £5,000,000, are annually exported by the Americans. Without here going into statistics, or the study of the different breeds, we will try to point out how a

goat-farm can be started and worked to show a clear return of at least 100 per cent.

It is generally believed that goats thrive only in the open; this, however, is an error. Goats kept in complete confinement do better than others for which pasture has been provided. In the centre of Paris, M. Crepin has succeeded in breeding and collecting the finest herd of goats ever brought together; and Mr. Holmes-Pegler, in his clever book on goats, tells us that they are far more healthy when kept indoors, and yield a greater quantity of milk.

When starting goat-farming it would be wise to obtain the advice of an expert, as some breeds are much better milkers than others. The Alpine or Swiss breed is the very best for this purpose, but the Spanish Murciennes are also excellent, giving, in their own country, as much as four quarts daily on very scanty food. Unfortunately, these are difficult to get in this country; but some English breed, or the Anglo-Nubian, can be obtained which will give a very fair result. Cold and rain are prejudicial to the health of the goats; they must be kept very clean, and if in confinement ought to be groomed every day with a hard brush. Stabling for goats is constructed on the same principle as that for horses, but on a very reduced scale. It has been the privilege of the writer to visit the model establishment of Mr. Ravenscroft at St. Albans and to see there to what perfection it is possible to bring goat-keeping; in fact, one would easily imagine one's self at a show of large toy stables such as are sold at our big Christmas bazaars, or viewing a miniature representation of some princely breeding establishments for race-horses.

Copyright *CONTRASTS.* "COUNTRY LIFE."

Goats will eat almost anything—hay, corn, maize, bran, cabbage, roots of all kinds, etc. They must be fed regularly, three times a day in winter, four times in summer. They should always have a supply of rock-salt, to which they must have free access, and water ought to be offered night and morning, oftener if required. This is a very important item in goat-keeping, as it tends greatly to increase the yield of milk. The milking

Copyright *BRICKET CROSS.* "C.L."

Copyright *SUNBEAM.* "C.L."

should be done very regularly, and it is not advisable to commence this before the kids are about a fortnight old. The qualities of goats' milk are as numerous as they are unknown compared with cows' milk. It is more digestible, richer in cream and in nutritive substances; its chemical composition is nearly the same as human milk, with the exceptions, which are in its favour, that it contains more phosphates, and its density is somewhat greater.

The butter obtained from goats' milk is a great delicacy; so also is the cheese, which, in a part of France called the Mont d'Or, is the principal industry of the country for miles round. The flesh of the kid is equal to lamb in every way; it can be prepared to suit all tastes, salted it will last for months, and in the mountains is a great resource.

Two distinguished Frenchwomen have been successful in goat-breeding on a large scale. Mme. la Comtesse de la Boullaye, who has a very large herd, has created the industry of goat butter-making in Brittany; and the demand for this article has increased to such an extent that she cannot supply it in sufficient quantity to satisfy the market. Mme. Lepelletier, wife of the Deputy of Paris, has a unique herd of magnificent animals.

It is difficult to give an exact account of the profits to be derived from this enterprise; but the following figures, based on actual results, will give a very fair idea of the return to be expected:

Loss.	£	s.	d.
Interest on cost of goat-house—£60 at 5 per cent.	3	0	0
Interest on cost of 24 she-goats and 1 he-goat, about £2 per head—£50 at 5 per cent. ...	2	10	0
Food at £4 per head per annum	100	0	0
Wages	25	0	0
Veterinary attention at 2s. a head	2	10	0
Straw bedding	2	0	0
	£135	0	0

Profit.	£	s.	d.
24 goats will give 2 kids each; at 5 months old will fetch 10s. each	24	0	0
Goats yield on an average 2 quarts a day for about 10 months, at 6d. a quart...	360	0	0
Manure from 25 goats at 10s. a head	12	10	0
	£396	10	0

The above estimate is extremely low, 1s. per quart being the very lowest price at which goats' milk can be obtained in London, and over 10s. can always be got for kids of four or five months.

Copyright *AT PASTURE.* "COUNTRY LIFE."

A COUNTRY CHURCHYARD.

THE snow had ceased to fall. A few last flakes yet floated in the pale light of the winter sun. The narrow country road winding on before me at last lifted and passed over the crest of the hill. And here, solitary, overlooking the valley, stood the dark, snowy tower of a country churchyard. A robin began to sing as I turned aside and entered by the old lich-gate. Else, not a sound broke the beautiful wintry stillness; not a figure, man nor beast, moved across these far-stretching reaches of new-fallen snow. Pale light and faintest-coloured shadow played in hollow and ripple, and every tree stood burdened, bough above bough, beneath the sky.

One may speak of "solitude" in such a place; and yet was there ever solitude that seemed so thick with witnesses? The very air, cold and clear, and soon to be darkened, seemed full of sounds and shapes beyond the human senses to reveal. The graves were old; many of them recorded only how patiently Time labours, and the rain gnaws. Many of them lichen and moss had patterned over, and their tale was gone. But, for the rest, scarcely one was there that did not bear its epitaph—shrewd old doggerel, whimsical, tender, and with here and there a line or verse of a curious beauty and brevity:

"Stranger, a light I pray!
Not that I pine for day—
Only one beam of light
To shew me Night!"

It was a naïf appeal to a "stranger" come, like myself, but to rest a little while before winter darkness should fall.

A few paces on stood a large oval stone, encircled with leaves of myrtle and clasped by two grotesque hands, as if he who held it knelt behind in hiding.

"Here sleeps, childless, friendless, a Widow,
Mrs. Rebecca Shore.
I was afraid,
Death still'd my fears:
In sorrow I went,
Death dried my tears:
Solitary too,
Death came; and I
Shall no more want for company."

But melancholy and foreboding were rare in these old legends. It is not the being dead that matters, but the having lived. It was bitterly cold in spite of the quiet air. Yet who could forbear brushing the bright snow away to read, bejewelled with rime, poor Tom Logge's candid summing-up?

"Here lies Thomas Logge . A rascally Dogge
A poor useless creature . By choice as by nature
Who never served God . For kindness nor rod
Who never did any . For pleasure nor Penny
Work in his life . But to marry a Wife
And live aye in strife:
And all this he says . At the end of his days
Lest some fine canting pen . Should be at him again."

That "pen," I am afraid, is still extant, a plume of the Phœnix; though this "rascally dogge" seems to have been in no great danger from it here. His near neighbours are Peter Vole and a sexton, who have, perhaps, by now, outslept all qualms of their company. They *seem* at peace.

"The Grave of Peter Vole:
Aged 96 yrs. 5 mos. 30 days
And expired with the Memorable Year 1805.
Here 's a pleasant Tale to tell
Of one ' lived long & lived right well.
Nigh an hundred year he were when he
Looked, and his double Death did see.
Privy and low says He to him,
''Tis Peter Penn or my eyes wax dim!'
So very softly in summer weather
Death took his hand, and they went together."

And on the other side lies the sexton, who, if his date be what it seems, may even have helped make easy here this very old man's grandfather:

"Here be the ashes of Jacob Todd
Sexton now in the Land of Nod.
Lonely he lived, lonely died,
With his mattock and spade and nought beside.
Ofttimes of evening here he'd sit
Watching the pretty Robins flit:
Now sleepeth e'en as deep as they
He bedded for the Judgement Day."

A rose and a little smiling head are perishing at each corner of a small sarcophagus that stands close under the overshadowing tower. The name at the foot is all but illegible:

"My mother bore me:
My father rejoiced in me:
The good priest blessed me:
All people loved me.
But Death coveted me
And free'd my body
Of its youthful soul."

Not a petal of the wide-open roses but held its little store of snow. I wandered on, stooping to read at random; here an old

wooden cross leaning crookedly over its one word "Peace"; here the great, flat, seventeenth century vault of Abraham Devoyage, "who was of France, and now, please God, is of Paradise"; and then Ann Poverty's narrow stone a pace or two beyond him:

"Stranger, here lies
Ann Poverty;
Such was my name
And such was I.
Spinster I was,
Angel shall be,
If Jesu pity
Poverty."

Nothing less, too, than a valiant knight's fine sepulchre rises here beneath its little grove of cypresses. What his office was, and what gown is referred to I know not, unless it be the night-gear of his Worship of Drowsytown:

"These be the bones of Sir Thomas Dill
That did in life High Office fill.
There never was a knight in his gown
That could with brass stare Sir Thomas down.
There never rid a Knight whose Sword
So valeted his bonded word.
Never on bier was laid a Corse
Fretted its eight hale Bearers worse.
And never to Eternal Day
Hath better Knight yet passed away."

Whose could have been the skill, and whose the pen that laboured so diligently for these pleasant people when nothing else remained to do them service? It was a wit, plain spoken at any rate, and had small respect for fine sentiment and flattery. The miser's shall prove it. I could make nothing else of the name:

"Asrafel Holt
May 1. 1700.
Here's buried a Miser:
Had he been wiser,
He had not come bare
Where Heavn's garmented are.
He'd have spent him a penny
To buy a wax Taper;
And of water a sprinkle
To still the poor Sleeper.
He'd have cried on his soul,
'O my soul, moth & rust!—
What treasure can profit thee
Now thou art dust?'
'Mene, Tekel, Upharsin!'
God grant, in those Scales,
His Mercy avail us
When all Earth's else fails!"

Here, too, the shrew:

"Here lies my wife,
Susannah Prout;
She was a Shrew
I don't misdoubt:
Yet all I have
I'd give, if she
Might but one hour
Come back to me."

She has for neighbour two brothers, "Robert and William Beau, Englishmen of this Parish":

"Robert & William, as in life,
Sleep here together without strife.
Children they were of one dear Mother
And did 'yond thought so love each other,
That like two fruits o' the selfsame tree
Each grew his brother's Effigy:
Till Rob would oft for Will be ta'en;
And Will's own self for Rob again.
But (windfall'n apples on one stem,)
Death blew, & Love hath buried them."

LUNGING.

Winter twilight is brief. Frost had already kindled his countless sparks along the snow. The moon was up, silvery against the sun's last red. The last robin was flown to his crevice. Here was the same old unanswerable question confronting the traveller in spite of all these gentle voices. "I have no tongue," cried one from his corner, "and ye no ears." I turned to go, and happened on Mistress Hew's, her roses ran to wood, in turning:

"Sleep sound Mistress Hew!
Birds sing over you;
The sweet flowers flourish
Your own hands did nourish;
And many's the child
By their beauty beguiled;—
They prattle and play
Till night call 'em away,
In shadow and dew:
Sleep sound Mistress Hew!"

Birds, flowers, children, all had forsaken the kind heart; all perhaps would return with April. Two epitaphs yet remained—John Sheeves', and one on a cracked and dateless stone beside the tottering gate:

"Here lies an honest Man
John Sheeves the Publican.
Ay, but a sinner too
Penitent thro' and thro'."

And the other, in whose lofty tree, I imagine, many a thrush must perch to sing of evening:

"Here lies poor Nat Vole
Fast asleep now poor Soul!
'Twas aye one of his whims
To be telling his dreams,
Of the lands therein seen
And the journeys he'd been!—
La, if now he'd speak
He'd not listeners seek!"

The old tower echoed to some shrill far-away cry, brooding hooded and solitary over its charges. And darkness made all illegible; for the moon was only at her halves, and in chase of dawn.

WALTER DE LA MARE.

HORSE-BREAKING.

BY THE MARCHIONESS OF BREADALBANE.

THESE notes on making and breaking young horses are not intended to compete with the experience and knowledge of the professional or practised horse-breaker. They have been compiled by an amateur for practical work in a private stable where the hands are inexperienced, and the most has to be made of any sort of horse or pony which happens to be produced by the breeding-stud, either for sale or for personal use.

When the horse has first to be handled, it should be ascertained whether he has ever been tied up. If not, he should be tied in a stall during the day only, a cloth put round the head-collar to prevent friction to the ears, and put into a box at night without head-collar or any rugging. I have known young horses get cast, even when loose in a box, by entangling their hind feet in the head-collar, in their efforts to scratch it off. The young horse should be stood in a stall as nearly as possible facing the stable door, as at first it is well to avoid turning and twisting round corners and doorways, especially with the dumb jockey on, which projects on each side of the back, and is apt to catch against the stable walls and doorways in leading in and out.

Next the horse is firmly fastened with pillar-reins to the head-collar. (It is a source of great expense to use leather pillar-reins with young horses, as they break them by the dozen, chucking their heads about when first they are put on in the stall.) Gently coax a bit into his mouth, strapping it loosely to the head-collar. The best bits for this purpose are those specially intended for use with the dumb jockey, furnished with droppers, which act as a sort of plaything, and occupy the horse's attention. Great care should be taken that the bit is wide enough for the mouth, or it will very soon cut the edges and set up a bad sore. I once saw a groom trying to "bit" a horse for the first time with a pony bit, the rings of it acting as a vice, causing intense pain and terror to the horse. After a few days a dumb jockey should be placed on the horse. Let the horse see and smell the strange-looking object before it is suddenly clapped on his back, with buckles and straps touching and tickling him in a dozen different places. Let him once satisfy himself that it is not an infernal machine, and half the difficulty is overcome. Leave the reins very slack, and do not attempt to put on

the crupper at first. After the crupper is adjusted care must be taken always that the reins are not too tight, as if a young horse's head is constantly kept in a wrong position, serious injury to windpipe and breathing organs may ensue. After the horse has become thoroughly used to the dumb jockey in the stable, he should be led out in the cavesson bridle and taught to walk, back, and turn without difficulty or effort. The dumb jockey should never be kept on a horse too long at a time, or it is likely to make him hang on the bit and acquire a dull mouth. The horse should then be taught to "stretch" himself, or "stand out." It is wonderful how quickly a horse understands his lessons, and how willingly he falls into them. I consider a horse properly "mannered" to be worth an additional £20.

TEACHING TO STAND OUT.

While I am on the subject of showing horses, a word as to the knack of "running" a horse. This should always be done with a very loose rein, full scope being given to the horse to show his paces. The man running should try to keep up with the horse, not hang on to his head and be dragged along. If the man has tight hold close to the bridle, the horse's head is pulled all to one side, and his paces are entirely spoilt. There is as much to be learnt in running a horse well by the man as by the horse.

The next step in the life of a three year old is lunging with the long rein. Many horses are very stupid at this at first, but, after being led off once or twice, generally take to it. Now comes driving with the long reins, with a man at the horse's head to start him and keep control, and a man behind driving, who, keeping clear of his heels, teaches him to answer to the bit, turn, twist, go forward or backward as required. After a time or two, he will go quite naturally without being led, and will thus learn to answer to the bit before being put in harness. An active groom will take a youngster out on the long reins for an hour at a time, even running with him, and teaching him to pass carriages or other traffic.

DRIVING WITH LONG REINS.

The last lesson is driving with the log on the grass. Here it may be well to give a short description of the log. The size and weight of it should be judged by the size and weight of the horse. It must be remembered that the log is a dead weight on grass, and, if not carefully selected, may be the means of teaching a horse to jib. Roughly speaking, for a horse of 15h., the length of the log should be from 8ft. to 10ft., and the diameter from 6in. to 8in. Light wood, such as larch or spruce, should be used. A hook is fixed at the end of the log, and a bar attached (an old team leader-bar serves the purpose); to it are hooked the chains by which the horse is to draw—harrow-chains from the nearest farm are generally available. A suitable collar has been tried and left on for a time the day before, hames are strapped on, and the horse is led to the log, where the chains are already attached to the bar. He is backed to the proper position, the chains are hooked to the hames (to the buckles of the short ends of a pair of old traces), and away he goes, a man at his head with the cavesson bridle, and the man with the long reins driving from behind. Before taking him out, turn him about and let the chains touch him everywhere, so that he becomes thoroughly used to them. After the above-described treatment has been continued for about six weeks, the three year old is released from the schoolroom and sent back to his brother babies at the stud farm.

From an economical point of view, I have always broken young horses in the winter, when of necessity they have to be artificially fed in any case. If taken up for breaking in the summer, it means artificial feeding at a season when they are able to shift for themselves on natural food. For some time I have fed the three year olds, while being handled, on "mixed grains" instead of oats. The horses eat this with appetite, and the cost is considerably less. I also use turnips to a great extent. Such items, small in themselves, help to lessen the forage bill where there are a good many youngsters to feed and break.

A year has passed; the four year old is now shod, groomed every morning, and well fed, for the work to be done will soon, in his grass-fed condition, run him down unless this is attended to. It is well when first commencing with a four year old, after a year's rest, to keep him for a week or so at what he has done before—lunging, long reins, and the single log. After which he can be put in double harness on the log for about a week, with an old horse alongside to teach him to work with a neighbour. Any extra old coaching bars will suit the log for this purpose.

Now comes double harness in the brake with an old horse to keep him straight. In putting a horse into harness for the first time, all adjusting of tackle should have been done the day before. It is a capital plan to take the horse so

DRAWING THE LOG DOUBLE.

harnessed out on the lunge, and trot him round with breeching dangling about his legs. The day he is first harnessed he should be got ready some time before, fed, and allowed to stand quietly with harness on, then walked quickly to the trap and put to with as little delay as possible. In leading horses out of the stable it is always best to hold them by the nose-band and not the bit, as horses with sensitive mouths are easily upset by a jar to the mouth. Putting young horses to a carriage for the first time should never be done in the stable-yard, but on the roadway outside, as serious damage may arise from a fall in plunging about at starting on the stones of the yard.

THE FINISHED ARTICLE.

Where possible, the first few turns in harness should be given in a flat grass field, with a man at the young horse's head, and another with the loose rein (as afterwards described) beside the driver. In this way he gets thoroughly used to the harness and trap before going on the roads. I would always recommend taking a youngster up to a carriage for days before harnessing, rubbing the shafts or pole about him, and giving him a pinch of corn at the time, so that he may become thoroughly used to the look and feel of it before having to drag it. I consider double harness the best for starting a young horse, if he is not suspected of being a kicker. A good old brake horse drags him on and pushes him about without much mercy. If the youngster looks like giving trouble it is best to put him in single harness, as the driver has more control over one horse than two. After the horse has been driven in double harness a few times he can be tried in single, or, if he starts badly in double, he should be put in single harness at once.

There is just a word or two to add about safe and proper harness to use for breaking purposes. One hears it said any old harness will do, but any old harness will not do. Harness used for breaking purposes should be quite trustworthy—never mind how common or country made; let it be sound and safe. I always use a kicking-strap in double harness made of two long straps crossed over the back, screwed to the pad by the terret-rings, and attached to the bar with leather tugs. This gives the driver a sense of security in handling the horse, and he can keep him up to his work by moderate use of the whip without the risk of an accident from kicking. In single harness I always use a rope kicking-strap as well as the leather one. It is impossible to say where leather may give way with a sudden jerk, whereas rope, being more pliable, will hold a kicker far more securely. I also use an extra or "loose rein" when breaking in all harness. This is a long single rein buckled to a hames' strap, and fastened to the middle or lower bar of bit across from side to side. The rein is held loosely by a man or boy sitting beside the driver. It gives absolute control over the horse, so that should an accident occur and the driver be thrown out, the man with the loose rein, no matter what happens, has still hold of the horse, and so prevents the fatal result of a young horse "getting away." It will be readily understood that the driver's reins through the terrets are useless in such an emergency. The loose rein should be held very slack, as the leverage is very severe and the slightest touch checks the horse. Knee-caps should invariably be used in breaking horses. Half-an-hour a day increased up to five miles is about the amount a young horse should be required to do in harness.

Three or four months of this sort of work should make him safe and trustworthy, but I would never recommend taking a horse into regular work under five years old. If given just this much more time he will repay his extra keep in the end.

[We publish the Marchioness of Breadalbane's interesting communication with pleasure, though without quite agreeing with her as to the best and most expeditious methods of breaking a horse to harness.—ED.]

IN THE GARDEN.

THE WHITE AND OTHER PINKS.

JUNE is the month for Pinks, and nothing is more welcome at this time than the deliciously sweet white flower which is now in full bloom. Though it is in most gardens, it is not nearly enough used in the best ways. Because it is a useful border plant is no reason why it should not also be used in the rock or wall garden, where it is quite in place. In rocky drifts, or crowning stony masses, or nestling at the rock foot, its neat tufts are always delightful, while its sun-baked fragrance, here and elsewhere, is one of the charms of early June. No flowering plant is better as a garden edging, and it should not be forgotten how excellent is its foliage in winter, for then is it in perfection. Mrs. Sinkins is one of the most popular of white Pinks, but the flowers burst badly in wet weather, and the same fault must be urged against the variety Her Majesty. The Pink that has always behaved itself in the writer's garden is Albino. The flower is not large, but there is a roundness and fulness in the petals which are commendable traits, and the calyx seldom bursts to let out the fragrant florets. Mrs. Welsh is a fine sort, Snowflake is another good white, but in thinking of the white Pinks it must be remembered that the old fringed white is as pretty and as fragrant as any, though in the thirst for novelties it is likely to be neglected. There are several

Mule or Hybrid Pinks are of much beauty, and the way to increase these is by cuttings or by layers. The more important are the following: Dianthus Alice Lee, a double white flower, its best place being the rock garden; D. Atkinsoni is a beautiful mule pink, named after Mrs. Atkinson, who raised it in 1845. We have frequently stopped to admire the beautiful crimson colouring of the flowers, which are poised on slender stems. Unfortunately, the mule Pinks are very troublesome to increase, but that excellent gardener the late Captain C. Nelson, brother of the late Rev. J. G. Nelson of Narcissus fame, had a good plan for the renewal of these Pinks that was of special use in the case of D. Atkinsoni, which often blooms itself to death. He simply removed all the flowers from some of the plants; these, by autumn, were fine spreading tufts that could be divided. By this means he secured a yearly supply of flowering plants. D. Lady Dixon is said to have resulted from crossing the Sweet William and Clove Carnation. There is something of both parents in the mule; the flowers are reddish crimson in colour, and are very fragrant. It is a good garden plant. D. Marie Parè is well known to Pink enthusiasts. The flowers are pure white, and make a brave show in the garden. D. Grievei, we well remember, grew many years ago on the rock garden at Kew. It was raised by the Scotch grower Mr. James Grieve, who crossed a Sweet William and single laced Pink, with this result. The colouring varies from white to rosy pink, and in the same clusters this difference in shade is noticeable. The leaves are like those of the Sweet William. D. Michael Foster is a double-flowered hybrid, and very showy. One of the most striking of all the hybrid Pinks is called Napoleon III. The flowers are deep crimson, and borne in great profusion, but, unhappily, it is difficult to grow. D. Spencer Bickham is a cross between D. cæsius and D. deltoides, the pretty little Maiden Pink. It is a plant of quite dwarf growth, not more than a few inches high, and is for that reason a Pink for the rock garden. The colour of the flower is crimson, with a shade of rose in it. D. superbus has very sweetly-scented flowers, double, crimson in colour, and it remains in bloom over a long season.

The Carnation Maggot.—We have received several Carnation plants lately which have succumbed to the attacks of this terrible pest to the Carnation. The Carnation maggot is the larva of a fly known as Hylemyia nigrescens. It bears a great resemblance to the common house-fly, but is not a pest to trifle with, although it is insignificant and apparently harmless. Few of the enemies of the Carnation are capable of greater mischief, and the plants in the borders suffer most severely, especially seedlings and layers; but layers under glass escape. The flies may be seen busy among the plants in April and later. They deposit their eggs at the base of the leaves, and a small maggot is hatched out which eats its way down the leaves into the very heart of the plant; it works its way down the leaf under the membrane, a whitish line showing the path it has taken. If this track is followed the maggot may

be captured, and if its presence in the centre of the plant is discovered, pick out the pest with a needle and destroy it. It may be found in the form of a small white maggot, or in the chrysalis state, when it is of a brown colour. The centre leaves are often quite eaten through at the base, and when pulled out there is the chrysalis or maggot. The Carnation is generally killed; but destroy the maggot at all cost, as the chrysalis may speedily develop another fly, which in its turn may be the parent of a fresh brood of maggots to work destruction in autumn and winter. There is no other way of dealing with the Carnation maggot except by hunting it out in the way suggested. The grubs are about one-eighth of an inch in length, legless, and white with dark heads.

Random Notes.

Work in the Garden.—The blessed rains of early June have worked wonders in the garden, and wholesale failure of Sweet Peas and many vegetable crops has been averted. July is frequently dry and wet, and it is a mixture of both that is most desirable. One of the chief duties in the flower garden from this time until quite autumn is the removal of seed-pods, which have the effect of quickly stopping the opening of fresh flowers. A plant is unable to bear the double burden of seed bearing and flower production. When the weather is very dry resort to mulching, which keeps the roots cool, and prevents moisture escaping from the soil. Dahlia stakes must be seen to, and the shoots thinned out where these are very thick. Take cuttings of Pinks, which strike very easily under a handlight in prepared soil in the open garden. One can hardly have too many white Pinks. They may be used as edgings in the kitchen garden, and the flowers are useful for cutting. Mrs. Sinkins, Her Majesty, and Albino are three of the most popular; the first named is as cheap as any. It will soon be time to layer Strawberries, and the wise gardener always has a fresh bed yearly. Plants after the second and third year are rarely a success, as the fruit is scanty and small. Plants and young trees also benefit greatly by gently syringing in the evening of a hot and dusty day. It freshens the foliage, and is of some assistance to the fruit.

The White Judas Tree.—The Judas Tree (Cercis siliquastrum) is well known, but the white variety, alba, we have only seen on one or two occasions, the last being in the arboretum of the Royal Gardens, Kew. The species is known by its pretty purple clusterings of flowers, which are attached to the old wood, and seem scarlet on the dark-coloured bark. It comes from the Mediterranean region, where it attains a height of about 20ft., and enjoys for soil a sandy loam, with full exposure to the sun and air. The white Judas Tree is a charming tree, and we hope it will not long remain in obscurity. It blooms with even greater freedom than the type; the flowers are larger and more numerous, and they are snow white, so clear and distinct that the tree is conspicuous from a long distance. One wonders what the white-flowered shrub can be that stands out from its fellows, until, of course, it is seen close at hand. The Judas Tree is frequently grown against a wall; but it also makes a very handsome shrub or low-growing tree, in which form it may be seen in the Royal Gardens.

The Double Wistaria and W. multijuga.—Many shrubs or trees have flowered this year which have not done so with the same profusion before, and the double Wistaria and the long-racemed W. multijuga are illustrations of this. The double variety is quite double—no false description, as is frequently the case with plants so labelled. Each bloom is almost a rosette, and the flowers hang in graceful racemes, as in the ordinary Wistaria which we know so well. The colouring is somewhat darker, however, and more effective. It seems to have a warmer shade of blue, which is peculiarly beautiful when the plant is allowed to ramble into some neighbouring tree or mingle with Virginian Creeper, as Mr. Waterer allows it to do in his Knap Hill Nursery, near Woking. The double Wistaria should not, however, be planted in quantity. Our experience of it is that it is only once in many years that the racemes are produced in profusion, and that it has none of the free-flowering qualities of the old kind. W. multijuga was very beautiful a few days ago at Kew. This has the longest racemes of its family, these having a length of between 2ft. and 3ft., and the colouring is very soft and unusual. The tree made quite a fairy picture.

The White Rose Frau Karl Druschki.—This new Rose became immediately popular, although it belongs to the much-neglected Hybrid Perpetual class; but the reason is not far to seek. The flowers are very large, but with a certain refinement, and dead white, without a trace of colouring. It is the whitest Rose in existence, sweetly perfumed, and very free. A combination of such virtues as this easily accounts for its many friends. We notice that in the Royal Gardens, Kew, the plants are pegged down, and the strong shoots are now bearing many of the fine handsome flowers. It is not only a good Rose for the garden, but the exhibition also, and we well remember how frequently it occurred in the prize boxes at last year's Rose shows. It was first brought to the notice of the public in 1901, and was raised, we believe, by Mr. Peter Lambert.

Rose Prince de Bulgarie.—This is one of the loveliest of all the Hybrid Tea Roses, and has been shown on several occasions this year in the Royal Horticultural Society's Hall at Westminster. The flowers were, of course, from plants in pots, but we have seen plants in the open garden which were quite as clean and refined in colouring. Rose-growers should watch for this hybrid at the exhibitions during the next few weeks, and if the colour is admired it may well be added to their collections, the plants being very free and strong in growth. The petals are broad and of delicate shades of colour, rose, salmon, and apricot mingling together, and then passing to quite an apricot colour towards the base of the petals. As the name suggests, it is a French-raised Rose, and Pernet-Ducher, who has given us so many beautiful Roses, is responsible for it.

Day Lilies and Ferns.—A fernery, or even a wild bit of the garden where Ferns are left to themselves, offers many opportunities of making pretty pictures. Bluebells, or Poet's Narcissus, mixed with Ferns, are very fresh and charming in spring, and when these have faded Day Lilies will take their place. We have such a corner in the garden. The Day Lilies have been planted five years, and have become thoroughly established. The yellow colouring of the flowers is very rich, and the scent sweet and powerful. Day Lilies seem to grow anywhere, even at the foot of a Yew hedge.

BISHAM ABBEY, BERKSHIRE,

THE SEAT OF SIR HENRY VANSITTART NEALE.

OF the many houses on Thames bank it is, perhaps, Bisham Abbey which is most sure of homage from the oarsman who goes by. The crow-stepped gables and the battled turrets show through the trees in a picture so gravely beautiful that oars must be shipped as the boat drifts past it. The house in Cliveden Woods as a palace, is magnificent, but an old house of rambling shape, patchworked with centuries, calls at once to the sentiment of those English who, in spite of their long laughter at the phrase, do truly take their pleasures sadly.

Bisham, a Berkshire village on the Thames, between Marlow and Temple Mills, is one of those villages which, having been famous in their day, have fallen upon untroubled sleep. Its fame came to it by reason of those religious communities, who chose it out, as they chose many another pleasant site amongst the trees at the edge of the broad water.

Copyright THE ENTRY. "COUNTRY LIFE."

First of all came the soldier monks, the knights of the Temple, whose name remains to this day in the Temple Mills hard by. The Templars had a preceptory here as early as the twelfth century, and here they kept house until the Order was driven from all its houses here and abroad. The humble order of dervish soldiers whose seals of two knights riding upon the one horse spoke of their earlier poverty and humility, had become rich and proud, violent—and obsolete. Their haughty seclusion and the close comradeship within the Order bred angry whisperings, which grew louder and louder until Europe screamed curses at them, showering strange accusations of wizardries and shameful mysteries. They had worshipped the goat and the cat, they had a black image before which they bowed. They had fouled the crucifix with a ritual of insult, and men who had been blithe as birds before they became Templars went ever after pale-faced and heavy with the thought of the secret sins of the Order. So the Order of the Temple went down, never to be set up again, and Bisham passed from it with many another house and manor.

William de Montagu, the first Earl of Salisbury, set up the second religious house at Bisham, where he founded a priory of Austin friars, which flourished under the patronage of his descendants, Montagus and Nevills, of whom a long line were buried here, beginning with the founder, whose body was brought to Bisham with the bruises of a Windsor tournament upon it. The priory endured until 1536, when Henry VIII. set in the prior's place a mitred abbot with thirteen monks of the Benedictine rule. But the new abbey was founded in the last days of abbeys and priories. Two years saw the end of it, and Bisham passed to the crown. The last of its priors who held

Copyright THE SOUTH-EAST CORNER. "COUNTRY LIFE."

office for less than a year has a name which should be recorded amongst the worthies or, let us rather say, the celebrities of Bisham annals, for he was one William Barlow, a remarkable figure amongst the reformation prelates. Whilst serving the King on an embassy to Scotland he was elected Bishop of St. Asaph, and within the next thirty years he had progressed from St. Asaph to St. David's, from St. David's to Bath and Wells, and from Bath and Wells to Chichester. By religion he was a flabbily enthusiastic person, and by calling a place-hunting churchman of a bad type, eager to buy interest and advancement by gifts of that which he held in trust. Not the least of his achievements was his marrying of his five daughters to five bishops. Anne he gave to the diocese of Hereford, Margaret to Lichfield, and Frances to York, whilst Elizabeth and Antonia each in her turn ruled a bishop of Winchester.

Copyright CARVING OVER THE HALL CHIMNEY-PIECE. "COUNTRY LIFE."

Bisham ceasing to be a house of religion, became a manor of the crown, and was part of the royal settlement which was to console the flouted charms of the substantial Lady Anne of Cleves. Under Edward VI. she petitioned for leave to exchange Bisham for certain Kentish lands with Sir Philip Hoby, the Master of the Ordnance, and with the interest of Cecil the exchange was effected, although in a letter of 1552 Sir Philip remarks the dissatisfaction of the Lady Anne, who had, no doubt, been persuaded into a one-sided bargain.

Sir Philip Hoby may be taken as a type of those new men who swam well in the troubled waters of the Tudor age. He was son to a Leominster gentleman descended out of a Radnorshire family. He began in the King's household service, and by that way came the Cecils and Russells to power and estate. We hear of him first as a gentleman of the privy chamber despatched on such services as were the common task of those about a Tudor King as they would be to-day of those in the household of an eastern prince. Thus we find Philip Hoby on a mission to apprehend certain foreigners under suspicion of being Jews who were venturing their persons in a land which had for ages closed its ports against the race. These men are examined before Master Hoby, who sends their depositions to London with an inventory of their goods.

Very early in reformation times Philip Hoby made his choice for the doctrine of the reformers, as is seen by his committal to the Fleet Prison for having maintained, or hidden away, a clergyman who had "evil opinions" of the sacrament of the altar, but six days of durance purged his misdemeanour and soon the time came when persons of Master Hoby's way of thinking

Copyright A VIEW FROM THE SOUTH-WEST. "COUNTRY LIFE."

BISHAM ABBEY FROM THE LAWN.

Copyright "COUNTRY LIFE."

went in no danger of the tipstaff. When monks and friars went out he was one of those who came in; as the King's diligent servant he had his full share of the spoils, and the rapid ending of the house of the grantee of Evesham Abbey has pointed a moral for the author of the "History of Sacrilege." In 1554 Philip Hoby was in arms at the winning of Boulogne, and was made knight after the siege.

The servants of King Henry did not want for change of employment, and in 1548 Sir Philip began his career as diplomatist by going as ambassador resident to the court of the Emperor Charles V. In the next reign he was sent to Paris, with the Marquess of Northampton and others, to treat for the King's marriage with Elizabeth, daughter of Henry II. Our young King notes in his own diary the brave show of Sir Philip Hoby as he set out followed by ten gentlemen of his own in new velvet coats and chains of gold. His next service carried him to Antwerp, and at this time Bisham came into his hands and the office of Master of the Ordnance. He was one of the ambassadors resident in Flanders during the nine days' reign of the Lady Jane, and one of that poor lady's few state papers was an order to him and his fellow, to continue in their place. With the pliancy of their century they saluted the new dynasty, and replied with a message in which the Lord Guilford Dudley, her husband, is styled "King." Having such a letter upon the table it is small wonder that Queen Mary's council recalled Philip Hoby from Flanders; but in the next year he had made his peace, was back again in favour and engaged at Brussels upon his last embassy. He came home at last in broken health, and dying in 1558 at his house in the Blackfriars, was buried here at Bisham.

The figure of Sir Thomas Hoby lies in marble beside Sir Philip. Several years younger than his half-brother, he was thrust forward early in his career by his brother's prosperity. A brilliant scholar, speaking many tongues, he travelled in France and Italy, and was knighted at Greenwich before going as Queen Elizabeth's ambassador to the court of France. Rumour has it that his loyalty to his Sovereign made him enemies in high place, and his death at Paris was set down by many of his countrymen to the sudden disease to which ambassadors in the sixteenth century were strangely subject. Men had many such stories in their minds, and even if London were silent we cannot doubt that Bisham spoke its mind when Sir Thomas Hoby was brought home, dead in his prime, to lie beside his brother.

Copyright THE GREAT HALL AND GALLERY. "COUNTRY LIFE."

This Hoby, a true son of a house of liberal learning, left some memorial behind him in his translation of that famous book, "The Courtier of Castiglione." As he loved books, so he may be said to have married amongst them, his wife being a notable daughter of a family of blue-stockings, the Cookes of Gidea Hall. Of the daughters, whom Sir Anthony Cooke had nourished upon Latin and Greek, Mildred the eldest was wife to the great Lord Burleigh, and Anne, the wife of Lord Keeper Bacon, was mother to Francis Bacon. Elizabeth, the youngest, was left a widow at the death of Sir Thomas Hoby. She loved funerals, the armories and banners, the black hoods and sombre hangings, the grave processions which followed death in good houses. At Bisham she set herself to the congenial work of building a chapel for the tombs of the Hobys, the chapel in which they stand to-day. The body of the elder Hoby was taken up from its grave and laid in the new tomb beside his brother. Over them both she set up this noble monument upon which the stately brothers lie side by side in their harness, sleeping with their heads propped upon their helmets. Their armour is a fair picture of the rich trappings of the day, enriched over breastplates, long tassets and bauldrons, from the rim of the gorget to the square toes, with broad bands of guilloche work. Each catch and hinge, each strap and buckle, may be studied as though the full suit were before us in steel, and at the edge of the plates we mark the slit edges of the leather of the padded linings. The birds at the feet of the two knights are the hobby-hawks, a play upon their name of Hoby. In one of two panels of the face of the tomb is the great shield of the Hobys with its quarterings of illustrious Welsh houses—the first coat having the strange bearing of three weavers' shuttles—and in a second panel a shield of seven quarters for Cooke of Gidea Hall. Above and about are verses and inscriptions in English and Latin from the pen of the learned widow. The elegiacs may be left to their repose, but the English verses of the midmost panel will bear repeating as a sample of Dame Hoby's work:

"Two worthye Knightes and Hobies bothe by name
Enclosed within this marble stone do rest
Philip the fyrst in Cæsar's court hathe fame
Such as tofore fewe legates like possest
A diepe discoursing head a noble brest
A courtier passing and a curteis knight
Zeious to God whos gospel he profest
When gretest stormes can dym the sacred light
A happie man whom death hath nowe redeemd
From care to love that can not be esteemd

Thomas in Fraunce possest the legates place
And with such wisdome grew to guide the same
As had increst great honour to his race
If sodein fate had not envied his fame
Firme in God's truth gentle a faitheful frend
Wel lernd and languaged nature besyde
Gave comely shape which made awful his end
Sins in his floure in Paris towne he died
Leaving with child behind his woful wief
In forein land opprest with heapes of grief
From part of which when she discharged was
By fall of teares that faithful wiefes do shead
The corps with honour brought she to this place
Perfourming here all due unto the dead
That doon this noble tombe she caused to make
And both thes brethern closed within the same
A memory left here for vertues sake
In spite of death to honour them with fame
Thus live they dead and we lerne wel therby
That ye and we and all the world must dye."

Dame Hoby, however, was to plan for herself funerals more splendid than those which custom accorded to the widow of a knight. After eight years of mourning she gave her hand to John, Lord Russell, son to the Earl of Bedford, and this husband also having the good fortune to die in her lifetime had, like Sir Thomas Hoby, an epitaph of her making in Westminster Abbey, where he lies. She herself lived on to an age of eighty years and more before she came to plan her own funeral and design her last and most splendid tomb. From her very deathbed she wrote to Sir William Dethick for an expert's advice concerning her hearse and burial offerings, asking what hangings of the church, what attendance of the heralds, what banners and scutcheons, and what number of mourners should be meet for the obsequies of one of her rank and estate. Upon her tomb she kneels at her prayer desk, with a coronet perched over the pleats of her strange and ample coif. Behind her kneel three daughters, and behind these her two sons, Edward Hoby and that Thomas Posthumus Hoby, whose birth after his father's death gave him the double Christian name which made him remarkable in a time when a bare half-dozen Englishmen were thus distinguished. The lady on her knees before her in the full ruff and the robes of a peeress has, like her, a coronet behind that high roll of hair which stands stiffly above the forehead. This can be no other than Anne, her daughter by the second marriage, whom she had married to Henry, Lord Herbert, the Earl of Worcester's son. A dozen scutcheons with many-quartered blazonries in the armorial taste of the day speak of the ancestral honours of the Cookes of Gidea Hall, the Hobys, the Russells, and the Fitzwilliams, the panel to the left having the shield of the marriage of Lord Burghley with Mildred Cooke. We cannot leave the pedant dame without retelling the story of her whipping to death her little son who blotted his copy-books. History does not say whether the child was of the Hoby or the Russell marriage, but the lady's ghost wandering in her galleries and vainly washing her guilty hands with invisible water was proof sufficient for the Bisham legend, until a pile of blotted copy-books were dug out from rubble below the hall floor to stablish beyond question the chronicle of the Bisham ghost.

The tomb is surrounded with a railing, amongst whose spikes rise painted banners of iron or tin. This railing, and much else, by the courteous permission of the rector of Bisham, was removed for a time to allow this most successful photograph to be taken.

Sir Edward Hoby, the elder son of this old lady of splendid sorrows, was the last of the three famous Hobys of Bisham. He was born here in 1560, and to the advantages which his birth as Burghley's nephew would give him, he added by marriage with Margaret Cary, daughter of the Lord Hunsdon, the Queen's own cousin. Like his father and uncle, he was a diplomatist, and in his first mission to Scotland earned such popularity at the Scottish court that he pleaded an ague in order to save himself from the resentment of his jealous sovereign lady. He was knighted at his wedding. In 1592 Queen Elizabeth honoured his house of Bisham with her presence, and in 1597 he was given the constableship of Queenborough Castle, where he diverted himself with theological controversy and the making of such tracts as "A Countersnarl for Ishmael Rabshacheh" and a "Currycombe for a Coxecombe," sallies which drew furious answers yet more strangely title-paged. His generation hailed him a worthy scholar, and the learned Camden in his "Britannia" has a grateful word for this ingenious knight. The urn-capped pyramid at whose base sit four Cary swans, commemorates his noble lady by whom he left no issue, but one Katharine Pinkney bore to him, out of wedlock, a son, Peregrine Hoby, whom he made heir of Bisham. These new Hobys were baronets in the year of the plague and the fire, and the last of them died Dean of Ardfert in 1766, devising Bisham to his cousin Sir John Mill, whose widow sold Bisham to the Vansittarts, who hold

Copyright *THE WINDOWS OF THE DRAWING-ROOM.* "COUNTRY LIFE."

Copyright DAME ELIZABETH'S MONUMENT. "COUNTRY LIFE."

it to-day. Other and statelier tombs should be at Bisham, for Bisham was the burying-place of greater folk than these scholar-ambassadors. Somewhere in Bisham is the dust of Montagu, Earl of Salisbury, who took Mortimer from the queen's arms, and Montagus and Nevills, who came after him, had their graves here. To Bisham they carried the slashed body of Warwick the king-maker; in Bisham was laid the head and trunk of Edward of Warwick, the last heir male of the line of the Conqueror. In place of such as these the Hobys keep their funeral state, and the wise antiquary who lands at this river-side church will be grateful that at least the curious devices of Elizabeth Cooke remain to greet him.

George Vansittart or van Sittart, who bought Bisham from the widow of Sir John Mill-Hoby, was grandson of Peter van Sittart, who was born at Dantzic, a merchant who settled in England under Charles II. The family took its name from Sittard in Limburg, and before settling in Dantzic it had given many citizens to Jülich, near Aix la Chapelle. Peter van Sittart was a governor of the Russia Company and a director of the East India Company. His argosies sailed in the Baltic trade and to the East Indies and the South Seas. In the second generation the Vansittarts were rich country folk in Berkshire; and this grave house of merchants, favourers of the reformed religion, had become so light-heartedly English that no less than three of Peter van Sittart's grandsons were members of that community at Medmenham which our shuddering forefathers knew as the Hell Fire Club. It was Henry van Sittart who sent from India to the care of his brother Robert the ape to which Sir Francis Dashwood was wont to administer the sacrament during the brotherhood's wicked rites. But the van Sittarts kept the sound abilities which had advanced the Baltic trade. Robert van Sittart became Regius Professor of Civil Law, Henry was Governor of Bengal and father of Nicholas, Lord Bexley, a Chancellor of the Exchequer, who did in some sort endeavour

to wipe out the memory of his father's Medmenham follies by sitting as president of the British and Foreign Bible Mission. The eldest son of the purchaser of Bisham was a general in the army, and the colours of a battalion, of which he had the colonelcy, are those which our picture shows hanging in the hall at Bisham. The general's younger brother, Vice-Admiral Henry van Sittart, was with Nelson at that siege of Calvi which cost the hero an eye. Edward van Sittart-Neale, the last squire of Bisham, was a father of the great co-operative movement and a promoter of the annual congress of co-operators. His son, Sir Henry van Sittart-Neale, the present lord of Bisham, has been a distinguished civil servant, and gained a K.C.B. as Assistant-Secretary to the Admiralty.

The house of Bisham Abbey as it stands to-day is a puzzle, which the architect-antiquary has not yet worked out. In the ground about it lie the ruined foundations of the ancient priory of whose buildings it must have been a part. Our picture of the great entry shows the ancient work of the house. The porch is of the age of Edward I., and has a beautiful groined vaulting with moulded ribs and shafts with capitals. The fair window seen to the left of the entry has two lights, with a rose light above them, and cannot be later than the end of the thirteenth century. It lights a long solar chamber behind the hall gallery. The mass of the building is, however, of Tudor brickwork. The hall is a stately room whose ribbed roof has been restored to it, and has a gallery and a buttery hatch. The fine fireplace of carved stone, with carved oak above, was brought here from Wiltshire. The arms are those of the Stuart kings: the eagle crests of the van Sittarts which decorate the corners of the shelf are, of course, later additions. The handsome bay window of the drawing-room is said to have been thrown out when Elizabeth was a guest at Bisham, and there is no doubt that the present house is for the most part the work of the earlier Hobys, although even so modern a work as Mr. Cooper King's "History

Copyright THE TOMB OF THE AMBASSADORS. "COUNTRY LIFE."

of Berkshire" perpetuates the ignorant tale that the tower with much else is the work of the templars under King Stephen.

The beauty of Bisham is something beyond all dispute of antiquary and architect. The old house seen across the broad river amongst its ancient trees was the beloved of De Wint and the old landscape painters, and the camera takes it a score of times a day in the season of water-parties. But those who have once lain on their oars to look upon it will carry its picture with them without need of other memorial.

GEESE.

WHAT is a goose? That this question should bring us face to face with an unsolved problem is a fact which will probably surprise not a few. Nevertheless, such is the case; inasmuch as it is impossible, in the present state of our knowledge, at any rate, to frame any definition of these birds which shall completely exclude the ducks on the one hand, and the swans on the other.

To those who are familiar only with our British geese this statement may seem somewhat strange, for there can, indeed, be no great difficulty in distinguishing between the geese, ducks, and swans of Great Britain. It is only when we come to extend our survey that cut-and-dried definitions break down. As a rule, it appears to be a tradition among the geese, as with the swans, that both sexes should wear the same livery, which is renewed but once a year. From the swans they differ mainly in their shorter necks, from the ducks in their larger size and longer legs. But even in these particulars there are so many exceptions that to draw any hard-and-fast line dividing the three great groups is impossible. In the matter of size, for instance, we find the pigmy "cotton-teal"—an indubitable goose—dwarfed by one of our smallest ducks, the common teal. In the coloration of the sexes we find the kelp geese of America (Cloephaga) breaking through the rule, in that the male and female differ conspicuously in plumage. The snow goose (Chen hyperboreus) has a plumage identical with that of the Coscoroba swan, whose livery is white, relieved by black flight-feathers. The short, stout beak, characteristic of the typical goose, is by no means a universal family feature; neither are long legs their peculiar birth-mark, for we meet with the same in the long-legged tree-ducks (Dendrocygna). To make a long story short, the geese are a weariness of the flesh to the systematist, but a delight to the sportsman-naturalist and the evolutionist.

Since the evolutionist and the field-naturalist have more in common than the mere systematist, we may well leave the niceties of classification to those whom it may concern, and settle down to a brief survey of the contributions to our knowledge of these birds which the workers from these two standpoints have made.

As to the evolution question. All the evidence seems to show that the geese are the ancestral stock from which the swans on the one hand and the ducks on the other have been derived. We may, indeed, by a really beautiful series of links, trace out the gradual development of these types. First of all come the curious, ungoose-like, and ponderous screamers of South America. These are essentially land-birds, with a fondness for water, having the beak of a gallinaceous bird and the foot of a water-hen. From time immemorial they have lived on the leaves, roots, and seeds of aquatic plants; and hence it is that they differ so much from the typical geese and ducks in the form of the beak. In course of time, as the descendants of these strange birds became more and more aquatic in their habits, the characteristic features of the goose tribe came into being. The first change appears to have been the development of horny tooth-like processes along the edges of the beak, and the development of a fleshy tongue, bordered by a fringe, such as we find in the modern geese. These characters are still more exaggerated in the swans, but reach their highest perfection in the ducks. Every possible gradation can be found, indeed, between the "teeth" of the geese and the marvellously delicate fringe of the shovellers. As a lesson in adaptation it would be impossible to find a more instructive theme than the bills of these birds. The screamers "pick up" their food after the fashion of fowls, and hence have similar beaks; the typical geese pluck short grass, seaweed, and other aquatic vegetation; the ducks have adopted a more varied diet. Many live largely on minute organisms, animal and vegetable, which are captured by taking water rapidly into the mouth, and expelling it by means of the tongue through the fringe along the edges

of the beak, leaving the solid matter in the mouth; just as baleen whales feed, in fact. Others feed solely on fish and shell-fish, and in them the beak is either long and narrow, as in the fish-eaters, and armed with recurved "teeth," or broad and flat, as in the scoters, which live largely on molluscs.

Simultaneously with the changes in the beak, brought about by the adoption of an aquatic life, the feet underwent a change, gradually increasing the size of the membrane connecting the toes at the base, until we got the half-webbed foot of the black-and-white goose Anseranas, and the cereopsis goose, and, finally, the enormous fully-webbed feet of the wholly aquatic diving ducks. The spur-winged goose (Plectropterus) and the screamers alone among the goose tribe—using this term in a wide sense—have developed offensive weapons in the shape of spurs in the wings. These are really formidable, and occur nowhere else save among certain plovers.

Among the geese we meet for the first time with certain peculiar bladder-like, but bony, expansions of the lower end of the windpipe, which, among the ducks, have become still further elaborated, reaching their maximum of development among the diving ducks. Indeed, in these birds there can be no doubt that it has become so hypertrophied as to be on the decadent scale. Anseranas struck out an original line, and coiled the windpipe in long coils under the skin of the breast! The swans have found a more excellent way of disposing of similar coils, inasmuch as they are stowed neatly away within the keel of the breast-bone! It is among the geese that we find the most primitive coloration of the nestling, inasmuch as in the cereopsis goose the young are conspicuously striped, as in the archaic ostriches and the gallinaceous birds.

So much, and a great deal more, which we may be permitted on a future occasion to recount, has the evolutionist managed to piece together of this, to the systematist, tangle of negations. What has the field-naturalist contributed? The record of his labours is no inglorious one; on the contrary, it is a story of hardship and privation, of dogged purpose and keen observation and resourcefulness. Nowhere, perhaps, have these facts been more admirably illustrated than in the monograph by Sergius Alphéraky, a translation of which has just been issued by Rowland Ward and Co. This is, perhaps, the most important contribution to our knowledge of these birds yet made. Herein the geese of Asia and Europe are described with a minuteness and care that leaves no point unnoticed, in so far as specific characters are concerned; while over and above this will be found most valuable observations in the life histories of these birds, penned, for the most part, from a first-hand acquaintance. It would be well, indeed, if some ornithologists we wot of could be induced to read, mark, learn, and inwardly digest some passages in the introduction to this volume, especially those relative to the variations to be met with in the matter of the colours of soft parts, size of the beak, and so on, characters which the author shows in the most convincing manner are due to age, and even, occasionally, to the condition of the bird.

Commenting on the mental attributes of geese, the author remarks that the prevailing notion as to their stupidity is based on the observation of domesticated birds, and that, as a matter of fact, geese are unusually intelligent. Some of his descriptions of wild geese, however, hardly bear out his contention. For example, he tells us that the snow goose (chen) falls an easy victim to his arch-enemy, man, by a very simple ruse. In the country watered by the Kolyma and neighbouring rivers, the hunters kill vast numbers during the time when these birds are moulting, and consequently flightless. "In the spots to which the geese most resort are built huts with open doors. In the evening the hunter puts on a white shirt, or shuba, and, having stolen upon the flock, shows himself, and then creeps into the hut, upon which all the geese follow, and enter the hut, while the hunter, having passed through, closes the door, and, running to the other side, kills all the geese in the hut." Again, on the authority of Naumann, he relates a strange trait in the habits of the grey-lag, "namely, that sometimes (they) will fly off with their offspring from a large sheet of water to a smaller one, and back again, without visible cause, but with extraordinary persistence and obstinacy. When they have decided to abandon any particular water, they carry out their intention at any cost, even if all the goslings should perish in doing so. The feeble young in down when hardly two weeks old are transferred by their parents to other waters lying within a two or three hours' march across open fields or along country roads, past mills, and even through settlements, so that . . . the young often perish from the assaults of foes, or simply from the hardships of the journey." The author suggests that there is method in this madness, inasmuch as the birds are prompted by a desire to find safer and less accessible spots for moulting.

The geese and their allies, it is hardly necessary to remark here—like the flamingoes and some of the rail tribe—moult all the quill feathers at once, and thus for a season are absolutely flightless. During the period of helplessness countless thousands fall victims to man's rapacity.

That geese are expert divers on occasion is a fact that will probably come as a surprise to many, yet such is the case; and it is interesting to note that we owe to one of our own countrymen, Mr. A. O. Hume, the first observations on this head. In describing the habits of the grey-lag, from his observations on these birds in India, he remarks that these birds when hard pressed dive fairly well. Later, Mr. Trevor-Battye discovered that the gosling at least of the white-fronted goose dived well; the only specimen, indeed, which he appears to have met with was captured by a dog after repeated dives to escape capture. Professor Menzbier remarks of the bean goose that it is an extremely cautious bird, and to escape danger will resort to diving. The author of the monograph now before us relates an instance of a bean goose, which he had slightly wounded, diving and reappearing in a few seconds some 200 paces off. "Having dived again it reappeared on the shore of the lake 400 paces off, and hid in the sedge." Similarly in the case of the swan goose (Cygnopsis cygnoides), we are told that, when threatened with danger, the old birds leave their young to themselves, which promptly escape by diving. While moulting, however, the old birds when pursued make for the water, and sink their bodies till only the head remains exposed, and where this is not sufficient they dive.

The loss of life inflicted by man on some species is appalling; either by nets or guns they are slain in thousands. As a consequence the breeding area of the grey-lag, for example, is contracting annually. The reclamation of land is another contributory cause to this war of extermination. According to Alphéraky this bird no longer breeds in Poland, the Tula province, and the Moscow province; in the latter it is no longer met with even on migration, and "there are many other places in European Russia where this bird has ceased to breed."

The white-fronted goose and bernicle goose are taken by the Samoyeds in thousands; this is done by driving the birds into nets while moulting. In a way there seems some sort of justification for this war of extermination, inasmuch as the victims furnish their captors with food for the whole year. In many cases, however, the down and feathers only are sought for. The red-breasted goose, for example (Rufiventra ruficollis), appears on migration in tens of thousands in the Transcaspian province. A Cossack officer describes an instance coming within his own experience on the Attrek, where hordes of these birds were shot down for the sake of their down and feathers only.

W. P. Pycraft.

HEDGEROW TIMBER.

SINCE the popularisation of motor-cars became an accomplished fact, certain proposals have been put forward tentatively for the purpose of removing the trees that line our hedgerows. The excuse generally made is that they overshadow the road, and produce a dampness which is bad for travelling. We doubt, however, if there are many people who would accept this as a valid reason for the destruction of one of the most beautiful and interesting features of the English landscape, one, too, which is quite different from anything to be seen on the continent of Europe. An article, showing the value of hedgerow timber, which appears in the new number of a contemporary, comes at a very timely moment. The writer, Mr. A. C. Forbes, naturally begins by showing the origin of this kind of timber. He says, "Many of the older writers assume, or imply, that it was planted, and give copious directions for the operation." Probably some of them were planted, but most of the trees were, no doubt, self-sown. Our hedgerows themselves were formed about 200 years ago, when the wastes of the manor, or commons, were to such a large extent enclosed. Some of these wastes grew a considerable amount of timber, which was claimed by the lord of the manor. Mr. Forbes says:

"When the constant encroachments upon these wastes were made by the copyholders of the manor, such trees would be preserved in a general way, and as these encroachments usually took the form of long narrow strips or patches of ground, not exceeding an acre or so in extent, it is easily seen that a large number of trees must have stood in the line of the rough bank which separated the copyhold from the waste of the manor, and which thenceforth became hedgerow trees. In some cases, perhaps, trees may have been planted, or specially retained as boundary marks, and as such were regarded as permanent landmarks."

If we want to understand how these trees were kept up we have to remember that

"The close, neatly-trimmed thorn or beech hedge is a very different thing to the old-fashioned bank and ditch, surmounted by a row of dead branches, thorns, or bushes, out of which was gradually evolved the 'stake and edder' fence, or the quickset hedge. Occasionally, especially along the boundary line of two neighbouring farms or estates, a narrow strip of ground was enclosed by a bank and ditch on either side, and was reserved for growing hazel, thorn, or other growth which could be used for 'setting' the banks from time to time. The tops of these banks formed, and still form to this day, more or less suitable seed-beds for the seeds of most indigenous forest trees, while species such as English elm and poplar, which produce root-suckers, will soon fill up such banks with a thick crop of saplings if left alone."

For many years the custom prevailed on the estate to pay hedge-cutters one penny for every sapling that was saved. As shelter it is difficult to estimate exactly the value of wayside trees. Where sheep and dairy farming are pursued to a large extent there can be no doubt at all that the livestock derive great benefit from the shade of the trees; but, on the other hand, if the timber be not well chosen, it will draw an amount of support from the arable land that will scarcely be paid for by the value of the timber. Mr. Forbes holds, and rightly, that the value of hedgerow trees as producers of timber depends very much upon the species, and he is very much in favour of the English elm; for, though the specific value of the timber is not high, its tall, straight, and well-shaped bole, its comparatively small crown, and the rapidity of its growth are very advantageous, while it propagates itself rapidly from suckers. Hedges also do very well under it—much better than under oaks, and, of course, beech is fatal to them.

BENCH-ENDS, OLD AND NEW.

THE wood-carvings of the choir-stalls in the cathedrals of Chester and Manchester have hardly hitherto received the attention that they undoubtedly deserve. In common with most other arts of the later Middle Ages, that of wood-carving in England has suffered, generally, from neglect and misrepresentation. The assertion is still too frequently made that we owe all the best work of this kind to alien artists, a generalisation based on two or three fairly authentic cases which have formed the common stock of writers on the subject. But a more reasonable view of the question shows that this theory is by no means tenable. The number of ecclesiastical buildings fitted with fine woodwork throughout the country during the fifteenth century was so great, that nothing but a national school of sculpture could have satisfied the large, widespread, and nearly simultaneous demand for the quaint but admirable devices which adorned the stalls and miserere seats of almost every monastic church of importance. This can only be realised adequately by an examination, wider than heretofore, of surviving specimens, such as those now before us; a comparison of them with other examples of contemporary arts; and especially the making of a careful record—photographic, accompanied by measurements, for choice—of every fragment of old work still in existence. From this point of view the carvings of Chester and Manchester offer a peculiarly inviting field to the student. Their proximity to each other, the excellence of the work in both cases, as well as the known connection of certain great families with the making of it, would seem to give great promise of fruitful results to such an enquiry. The Chester carvings are the earlier in date, having been, in all probability, executed at the order of Simon Ripley, the twenty-third abbot, who died in 1492. In their time they have suffered many indignities, all of which have, doubtless, been laid to the charge of Cromwell's soldiers. These fanatics certainly did much damage, but that they are not to be held responsible for everything the following evidence will prove. In the report of a commission on the state of Chester Cathedral, held by order of the Archbishop of York, and dated August 27th, 1633, we find the condition of the cathedral set forth in no doubtful terms: "The said church was very undecent and unsemely, the stalls thereof being patched and peeced, and some broken, and some higher than other." With one exception—at the end of the seventeenth century—no serious attempt at a maintenance of the fabric in a state of common decency was made until 1818; and it was only in the course of the final restoration, inaugurated in 1868, that the stalls were cleansed, repaired, and set in their present excellent order. The new work, it may be remarked, has been done with unusual sympathy and respect for the old. The subjects of the bench-ends and of the miserere seats are of the prevailing types—grotesque, often symbolical, often humorous, and always essentially decorative. A rare and remarkable example is the Tree of Jesse, which is very seldom found in this form. The seated figure at the elbow appears to be a pilgrim, but its interest lies in the typically English, one might say North Country, face, with its clean-shaven upper lip, and look of strong character and determination. This, at least, hardly suggests foreign workmanship. At Manchester the

THE CHOIR, CHESTER CATHEDRAL

THE TREE OF JESSE.

H. Walker. CHANCEL, TIDESWELL CHURCH. Copyright

bench-carvings are somewhat later, and their history is fairly well known, at all events so far as the facts that those on the north side were erected by Richard Beck, a merchant of the city, and bear his initials; while the opposite range of stalls was due to the generosity of Bishop Stanley, third son of Thomas Stanley, created Earl of Derby in 1485. Bishop Stanley was Warden of Manchester in 1481, and succeeded to the bishopric of Ely in 1506, so we may assume the stalls to have been made between those dates. He died at Manchester on March 22nd, 1515. The elbow ornaments and panels suggest a connection with this family in several ways. The subject of a relief on the Dean's stall is the old crest which the Stanleys derived from the Lathams of Latham, County Lancashire—the so-called "bird and bantling"—concerning which it is related in an old Visitation of Lancashire, now in the College of Arms, that a child having been found in an eagle's nest, and adopted by a Latham, the incident gave rise to the famous badge. The panel depicts the whole scene, with the people looking upwards at the eagle, who for this purpose has conveniently built an unusual nest in a tree-top. Other stalls have the Stanley supporters—a griffin on one, and a mutilated figure of the stag, "ducally collared with line reflexed over the back," on the other.

A notable piece of good heraldic treatment is exhibited in a panel with the old arms of Delawarr displayed on a shield—not Cantilupe, as stated by some writers on the subject. The dragon above is unusually good. The lion, whose head has also suffered severe mutilation, is probably another instance of heraldic suggestion, a source of this kind of imagery which has been too much neglected by those who have been desirous of placing it in its correct period. The carving of the late fifteenth century generally displays a very considerable technical skill. The wood is used in good broad masses, and boldly worked with due regard for its nature and growth. Subjects chosen are almost always treated conventionally, if with a certain crudeness. The so-called satires on monastic habits had probably far less force in their own day than they appear, to our greater sensitiveness, to possess. The wit and humour of periods later than the

H. Walker. CHOIR, MANCHESTER CATHEDRAL. Copyright

H. Walker. CHOIR, TIDESWELL CHURCH. Copyright

Reformation would be accounted mere vulgar abuse nowadays; and if a similar allowance be made for the miserere carvings, we need consider them as merely the fashionable joke of the period. The grotesque birds and beasts are derived in some degree from the old "Bestiaries," or Books of Beasts, but they occur very frequently in the decorations of illuminated service-books and Bibles. No monastic institution was without an equipment of this kind, generally rich enough in decoration to furnish themes for all the craftsmen who were employed about their churches; and it is pretty certain that this means of obtaining patterns was in common use for a considerable time before the Reformation, and that the carvers of the later Perpendicular period were, however skilful of hand, frequently indebted to earlier work for their ideas.

It is very interesting to compare the work of a modern carver with examples such as those which illustrate this article. In the beautiful Decorated church of Tideswell, Derbyshire, are a number of bench-ends by a local sculptor, Mr. Advent Hunstone, which may be said to be exercises in a style nearly akin to that of the Manchester and Chester stalls. It would be somewhat unfair to judge them by that standard, nevertheless; for the causes that produced the characteristics of fifteenth century style can hardly have been operative in the modern version of it. But Mr. Hunstone has succeeded in giving us simple, effective figures, well posed and reverently pictured. His drapery is skilfully dealt with, and the only fault that can be suggested is in the over-decoration of the finials. How far he has followed old models we have not been informed, but in any case, it would have been better to have omitted the little scene of the "Annunciation" from the poppy-head, here reproduced. It looks somewhat too insignificant in comparison with the really fine figure beside it. One would wish, in conclusion, to take this opportunity to make an appeal to all lovers of mediæval art to cherish every fragment they possess of the real old work. We hear stories of restorations—when the ancient carving either disappears, or is "given away" to private persons. Under no circumstances should any of it be alienated entirely from public us . If it cannot be preserved in the church of its origin, there are yet many museums. And, again, there is the necessity of making records of the beautiful craftsmanship of our forefathers. Every stall, every bench-end, every miserere seat should be measured, photographed, described, and the result deposited in one of our national museums. Only by systematic work of this kind can material be accumulated for a real study of the older arts of Great Britain—a subject better worthy of labour than many critics have yet imagined for a carving, such as that in the first

illustration, of the drunkard lifting a tankard, which the devil below is pushing up to his lips, is a conception that throws light alike on the mind and age in which it was conceived, and on the simple minds which it was intended to influence. To these the sermon of the rude woodwork would appeal as no eloquence from the pulpit could, and the artist may have succeeded where the preacher failed. EDWARD F. STRANGE.

MIDSUMMER CHATTER.

WAKING about dawn this morning (the day is Friday, June 9th), I heard the half whisper, half hiss of steady rain, while a distant roaring sound from a fir wood on the hilltop, and a fitful blustering in the garden trees, told all too well that the cold north-east wind of Monday, Tuesday, and Wednesday had returned. It was disappointing, because there had been enough rain; and the sunshine we wanted had seemed promised by the tolerable brightness of Thursday afternoon. The promise was too evidently broken. Here this morning was the cold splashing wet once more.

By a pleasant coincidence, as it proved, reading some hours later in Pepys's Diary for 1663 I came to the following entry: "July 1st—This morning it rained so hard (though it was fair yesterday and we thereupon in hopes of having some fair weather, which we have wanted this three months) that it wakened Creed, who lay with me last night, and me, and so we up. . . ." I read so far and paused, smitten by the reality of the thing. There were discrepancies, it is true, and great ones, but there was also a most lifelike resemblance between my morning and Pepys's. It was as if I was living in his time, or he in mine. How well I was able to picture—for the very thing was happening now—that pouring July morning to which England, and not Pepys alone, woke nearly two centuries and a-half ago! For though his London was a different place, his England would not be so unimaginable. To adopt an expression of his own, "at the very moment while he was writing those words," here in West Surrey drenched trees would be shivering in the wind, turning up the pale under-side of their tossed foliage, just as now when I write; larks would be singing, lost to view up in the grey rain, and irrepressible thrushes whistling in the hedges, and sparrows fussily chirping under cottage eaves. And through all villages and country towns the disgusted people would be telling one another, as Pepys doubtless told many and still tells us, how the rain woke them up, and how they really had hoped, after yesterday's

BENCH ENDS, MANCHESTER CATHEDRAL.

H. Walker. *BENCH ENDS, TIDESWELL* Copyright

sunshine, to get some nice, kind weather at last. It was a stimulating, and presently it became an impressive, fancy, as I realised how, underneath all the so-called important things we write about and read about, another and quieter, altogether more vast and unchangeable, stream of interests has continuously occupied us in England, filling out our life and making it really worth living.

Then a most vain wish came—that Pepys had found time to record not only his own and Mr. Creed's share in this living under-current, but that of others, the ordinary, common people up and down the country. I would have had him say how they bore themselves that wet morning. But the wish gave way to speculation. Looking forward another 240 years or so, to some wet and chilly June morning, will there not be found an Englishman, reading, it may be, of the King of Spain's visit, who will wistfully regret that nobody at this time thought worth while to record how the common people, not kings or State secretaries, were affected by this rainy week? How, for example, did the villagers in this parish take it? The great under-current that fills out life is going on here to-day, and is as well worth noting as in 1663. How people live, and not how they are disturbed in living, is the important thing; and if but a week, or even a single day, of the ordinary village existence could be truly set down, it would have more fascination than the records of exceptional events for a twelvemonth, because it would be so much more vividly alive.

It needed but this to bring back to memory with a new significance some of yesterday's almost unheeded talk. In the uncertain sunshine of the afternoon, farmers at the town market had spoken of the three preceding wet days. In their grudging way they reckoned that the rain had come too late to make much improvement in the hay crop. Still, the rain was welcome, and—well, their opinions and the tone of their voices became in the memory invigorating, being so intrinsic a part of the endless life of England's country districts.

Not less so afterwards was the quiet, innocent prattle of an old villager hobbling homewards very slowly because "his feet was so bad." "What a beautiful rain we've had," he said, in purring, soft voice: "it come so steady, without any runse." (Without washing out channels in the garden ground, he meant.) "And now if we gets some warm sunshine, won't the things go ahead! Did that frost touch ye much, in the end of May?" I fell in with his humour, which was, like the early evening, trying to be sunny in a tired fashion, and said, "No, not much; you see, I lie so sheltered." "That's a good job. It cut off all my taters and runner beans, and I fetched 'em all up the next evenin' and sowed again. . . . No, not the taters; only the beans. Last year I sowed my beans in April, and I was pickin' early in

July. Comin' so nice and for'ard I got fo'pence a pound for 'em, and that made it worth while, 'cause 'twarn't no trouble to put three or four pound into my basket and take into the town when I went to work o' mornin's. But if you be late plantin', then the autumn frostis comes and nips 'em off. I be late this year; still, this rain 'll help 'em. 'Twas a beautiful rain. The Lord very soon answered the prayers. I s'pose there was prayers put up all over the country for it Sunday, and 'twas sent o' Monday."

"All over the country," at any rate, one might imagine this same grateful talk going up, as a most intimate part of English country life; not often, I think, with so much avowed piety—for that struck a note I seldom hear—but with no less cordial appreciation. And when from the hilltop one saw, later in the evening, enormous storm-clouds pillaring up again in the north-east, drifting gloomily overhead, obscuring the blue and mingling with grey vapour and scud, one felt that all over the country rustic people were anxiously watching the sky, and, like this one I heard, protesting that what we want now is some nice warm weather.

It did not come, any more than when Pepys desired it. And so, in the cold wet rain before noon a man I saw over a garden hedge hilling potatoes straightened himself, looked fretful, and remarked, "It's very cold for June. The wind keeps here so," and he motioned towards the north-east. "If please Gawd we could get her round in that quarter" (he pointed south-westwards), "that 'd be what we wants now—nice warm summer weather." He spoke of peas, and learning that mine were almost ready for picking, asked their sort, and was told "Gem of the Season." "'Gem?'" he queried; "what, then? Be they a shrivelled pea? Years ago I had a 'Gem,' and they come in a fortnight earlier than any others. Such a little low-growin' pea! Well, nine inches would be a tall one among 'em. They growed in clumps, all bushy, with pods stickin' out all over the top. But it's years since I seen any of 'em." That was this morning. In the afternoon the man in my own garden said, "I thought you'd ha' had peas to pick for Whit-Sunday. And so you would if there'd come sun yesterday and to-day. It wanted that rain, but it wanted the sunshine now. As 'tis there won't hardly be a cookin'." Later still, the poor old man Bettesworth, whom I saw as he lay in bed, asked, among other things, relative to the garden he will hardly see again, "Have ye picked any peas yet, sir? Not yet? Oh, I thought p'rhaps you would. So-and-so picked some last week, they says. But the weather is so onkind, with this rain every day . . . but there, sure, we shouldn't ha' got nothing at all without it."

B. C. Wickison. *MORNING IN MIDSUMMER.* Copyright.

Did the country people talk so in Pepys's time? He has not told. But so they talk in the villages to-day. And monotonous though it is—like the twittering of sparrows—yet what were the country without all this simple chatter? The quickset hedgerows, and the grassy banks beneath them, are monotonous too—and pleasant. And even as they imperceptibly change while the summer goes over them, drenching them with rain or parching them with drought, so the average village talk changes and keeps step in the procession of the year. What English country people say normally is, in fact, not one man's idea in particular, nor another's; it is a sort of national crop, which indicates by its progress the season that is passing. And it is strange how true to its time it comes. Looking back through my journal, I find it noted that on June 13th, 1899, old Bettesworth was talking of his peas fit to pick, and was wishing for a shower. On June 10th, 1903, the first rain had fallen of what afterwards proved such a disastrous summer; snails were coming out from the hedgerows, and men on the roads were saying to one another (as probably they did in the earlier downfalls of 1663), "Nice rain!" On the same day, Bettesworth, hilling potatoes, showed me his old-fashioned hand-made beck, and told how it used to belong to his wife's grandfather. I turn on to 1904: June 20th is the date of the nearest entry, where it is related how Bettesworth, hilling potatoes, discoursed of the beck he was using, which his wife's old grandfather had once owned. I had forgotten, and so had he, that he had spoken of this a year previously, just as one forgets the very existence of certain flowers until a day comes and there they are. The season brings them out, and these country observations too, every one at its appointed time.

When Pepys's date comes—July 1st by the old style, or July 11th (is it?) by the new—about what shall we be talking? Of the weather, of course; more happily, we will hope, than in 1663; but besides the weather, of what else should we chatter, save of "broad" or "garden" beans? It is as certain to come as the scritching of the grasshoppers; and I know as well what will be said on or about July 11th, by rustics all over the Southern Counties, as if their voices were already audible. They

will affirm, "I likes to have one mess o' beans, and then I don't want no more." That is the normal expression, the proper seasonable opinion; and though you may have heard it in previous summers over and over again, still, if you have a genuine delight in English country life, you will not find it tedious, but welcome. You will be glad to hear it again. It belongs to the country. It comes in with the roses. GEORGE BOURNE.

POLO PONIES OF THE DAY.

THE polo ponies which are most in favour at the present time are those of the hunter stamp. Picture to yourself the horse you would like to ride across Leicestershire or Northamptonshire on. Reduce it from 16·1 to 14·2, Hurlingham measurement, and you have the polo pony of 1905. Let us take, for example, Worcester, whose photograph illustrates this article. She is not only of hunter type, but hunter-bred. We do not believe that she has any pony blood in her, though, of course, this is always possible, but it would be difficult to find an animal that fills the eye more as a polo pony. The perfect forehand will be noted, and if one might desire a little more power behind the saddle, there must always be something to criticise. But the proof of the polo pony is in the game, and this pony's present owner, Captain Miller, has said that no better polo pony in a game can be. Better even than Matchbox; but that famous mare was not quite everybody's mount, and, perhaps, if we class the Hurlingham first prize winner with Luna, or Syren, or My Girl, whom we have seen in the Champion Cup, we have said enough. Sceptre is another pony well known for good deeds, and she looks equal to any reasonable weight in any game. Bayleaf is a very nice pony, though I have the bad taste to prefer Mr. G. A. Miller's Bunny Rabbit, which seems to me to be very much what a polo pony should be. If you want looks, scope, and manners, there is Mr. Garland's Dr. Horace, a little old now, but none the worse for that, since many playing ponies rather ripen with age. In the first ties of the Champion Cup did we not see Rugby, when hard pressed by the Magpies, turn to the old and tried friends, and the game pulled, as it were, out of the fire by their aid? When Rugby—Mr. W. Jones, Mr. G. A. Miller, Captain Miller, and Mr. C. D. Miller—met the Magpies—Captain Jenner, Mr. Thynne, Mr. H. M. Brassey, and the Duke of Roxburghe—it seemed as if the latter team were only courting defeat. What chance could they have? As a matter of fact, whether or no Rugby were below their form, it was really luck that helped them to a victory. A ball striking a goal-post, the eye of an umpire discerning two very obvious offsides—these three chances might have changed the fate of the Champion Cup. As it was, Rugby just got home by a single goal, after a match of which, on the whole, they had not the best. But to have ponies so well tried as they have, is an advantage; the very sight of old Luna's square head is enough to cheer a friend or dispirit an adversary. Mr. Charles Miller himself would be the first to tell you that when he rides

My Girl he feels himself able to repel any attack on his goal. There were some new ponies. Mr. G. A. Miller, who has usually favoured the short, compact, handy, sharp ponies, was riding a chestnut with a bang tail, of the type we are rather accustomed to associate with Lord Shrewsbury, and apparently getting on well with it. He went back in the next ten to a pony of the Nipcat stamp. I could not see that Mr. George Miller was much less effective than he used to be, though his accident must be a handicap. But the best pony we saw during the afternoon was Mr. C. T. Garland's Buckingham. It was lent to Mr. Cecil Nickalls, and whether it was the pony, or whether the player was in form, he hit no less than three successive goals, all notable enough, from its back. This pony Buckingham is a whole-coloured light bay, an animal with a beautifully laid shoulder, a very deep girth, excellent back, loins, and quarters, and would be notable in any class of polo ponies. Roehampton, with the help of Mr. C. Nickalls and Buckingham, played a good game against Mr. Grenfell's team. It seems a commonplace to say that it was a better game than the score indicates. Yet I think that those who saw it at Hurlingham on Monday will agree that in this case this is something more than a phrase inserted to save the feelings of the defeated team. Captain Courage played a fine game, and it was no fault of his or of Mr. E. B. Sheppard that their team did not make a better show in scoring. The fact was they were meeting Roehampton, who seem to be the best team of this season, on their day. Very little behind the Roehampton men came the Magpies, who played a wonderful game, Captain Jenner and the Duke of Roxburghe being brilliant. Mr. Brassey was very unlucky in having to leave the team at critical moments, but when he settled down to his white pony he played well, some of his back-handers being wonderful in their force and accuracy.

So far as I have seen, and that is as far as the Champion Cup and the shows have revealed them, we have a most noteworthy entry of good ponies this year, besides the old-established tournament ponies. The polo pony does not soon grow old or stale, and Buckingham, Worcester, Ragman, Bunny Rabbit, and one or two more remain in one's mind as being worthy to stand side by side with such old-time celebrities as Charlton, Matchbox, Black Bella, and others whom there is no space to mention. If anything, our polo ponies do somewhat improve each year, even among the best, while the next class tread much more closely on their heels than they used to do five or ten seasons ago. We shall look forward to the Ranelagh Show, coming, as it does, next Saturday, at the height of the season, to show us what more cracks there are yet to come. X.

SEA-BIRDS IN JUNE.

SINCE the publication of our article on this subject in the Summer Number, several additional letters have come to hand, from which we select for publication a few that we think will have special interest for our readers. The first is a brief note from St. Kilda, that islet "set far amid the melancholy main." It is from the postmaster, and he says that, so far as his experience goes, there is no decrease in the number of birds brooding, but that the fulmar is increasing in numbers. Since going to the island, he has not noticed much change in the avifauna, though the gannet has been more abundant during the last few years, and some eagles have lately visited the island. He adds, although this subject does not directly appertain to sea-birds, that in the summer swallows come to St. Kilda every year.

Wyles. *HOVERING OVER THEIR FOOD.* Copyright

From the almost equally-distant Orkneys, Mr. Thomas Kent, whose photographs have often appeared in COUNTRY LIFE, sends the following note:

"Referring to your enquiry about sea-birds in this neighbourhood, I have pleasure in answering same and reporting as follows: 1. There has been no diminution in their numbers this year. On the contrary, puffins, cormorants, terns, and gulls are plentiful, and in the case of the last-mentioned there has been a considerable (and regrettable) increase. Mr. D. J. Robertson, solicitor, Kirkwall, who is a keen observer, says that he has noticed the puffins arriving at the island of Hoy in the spring and remaining for three or four days. Then they all disappear for a week, and return to commence nesting. He thinks that the first arrivals are the male birds, who make arrangements for and return with their partners. 2. There have been no appreciable changes in times of arrival, nesting, or departure. The terns arrived about May 13th this year—the usual time. 3. The only new species of sea-bird noticed in Orkney is the fulmar petrel, which is nesting in Hoy this year, and arrived here three (perhaps four) years ago."

We have had another valuable contribution from Scotland, which also comes from one with whose photographs and articles our readers are familiar, viz., Mr. Seton Gordon, who writes from Auchintoul, Aboyne, N.B.:

"I regret that your letter *re* the sea-birds has so long remained unanswered, but you see I am over thirty miles from the seacoast, so it takes some time to make reliable observations. Yesterday I visited what is probably the largest colony of terns in this county, and found that, if anything, the common tern has increased since last season, and this notwithstanding that most of the eggs are harried. I found fifteen lesser terns' nests, and should think there were thirty or forty pairs nesting. They are very confiding, and return to the nest even though you may be watching them. The black-headed gull is also breeding with the terns on the sand-dunes, which is, I think, unusual. I found four nests of the eider-duck. I found a nest of what was probably a roseate tern, which is seldom met with so far North. . . . I have also visited a favourite nesting site of the razor-bill, guillemot, puffin, and kittiwake. There seemed to be a slight decrease of the kittiwake and puffin, but the razor-bills and guillemots were, if possible, more numerous than ever, as were also the herring-gulls. As regards the land-birds, there is a slight decrease of the willow-warbler, and a marked decrease of the ring-ousel. The curlews arrived on the moors about March 15th, together with the golden plover and redshank; but numbers were killed by the severe storm of April, when the roads on Upper Donside were for a week almost impassable owing to the huge snow-wreaths. The curlews, redshanks, golden plovers, lapwings, etc., suffered terrible privations, and were at the end of the storm so weak that they could scarcely call at all. They were all in large flocks. The sandpipers arrived about April 18th in about the same numbers as usual. The oyster-catchers also are breeding on the river Dee in large numbers, but do not seem to call so frequently as usual. I have noticed also that the missel-thrush sang less frequently than is ordinarily the case, and I have not heard him in song since May 29th. The cuckoo is also, I think, less abundant than formerly, and I have not seen so many nesting woodcock as during last season. I hope these notes may prove of interest to readers of COUNTRY LIFE."

While another contributor, who is also a well-known naturalist, adds something to our knowledge. His special domain is Lundy Island, but, as will be seen, he was in the Farne Islands when our note arrived. Mr. A. J. R. Roberts writes:

"Last year was the first that the gannet failed to lay an egg on the island (Lundy). About fourteen birds came in, and four or five pairs began

to build, but were disturbed continually and finally left. The watcher placed on the island was practically useless; twenty would scarcely be sufficient. During the last five years I have noticed no decrease at Lundy in the numbers of birds nesting, but some people say, 'the birds are nothing to what they used to be.' There always are people like that, and I do not suppose there can really be much difference. Practically no guillemots' eggs were gathered there last season, but that probably will not affect the numbers, as the bird is capable of laying several times. I have been visiting the Farnes for the last fortnight, and stayed with the watchers on the various islands. The birds there are distinctly 'late,' and the small colony of Arctic tern on the 'Brownsman' is only commencing to lay now. I saw a solitary ivory gull there, and a good number of turnstone (non-breeders), and the remnant of a flock of purple sandpiper."

Gibson. AT CLOSE QUARTERS. *Penzance.*

To what we said before on the Scilly Islands the following two letters will prove interesting additions:

"There is not much difference to be noticed here amongst the sea-birds, nor in their usual habits. If anything, the kittiwake gulls are not so numerous; but, on the other hand, puffins, shearwaters, and razor-bills seem to have increased in number. Guillemots have also apparently decreased."—W. TREVELLICK.

"In answer to your letter of enquiry concerning the birds here, I have been on the islands twenty-two years, and as far as I can judge the sea-birds are much as usual, with the exception of two classes: (1) the common tern (Sterna fluviatilis), which does not breed so freely on the islands as formerly, and one only sees a few pairs in the breeding season, though it used to be plentiful and breed freely, and (2) the shag (Phalacrocorax graculus) are rapidly increasing, and are very numerous. There are two other classes, yearly visitors, hoopoe and golden oriole. The first I have not seen for three years, and only one or two orioles in a season now."—J. A. WHITE.

In conclusion we have to thank our correspondents for their interesting and valuable communications.

FROM THE FARMS.

HAND AND MACHINE SHEEP-SHEARING.

SOME little time ago an interesting contest took place at Bentham between two North Country clippers and a shearing-machine against which they were pitted. Frequenters of agricultural shows know the operation of the mechanical process very well, and no doubt opinions differ as to its efficacy. For our own part, we have always somewhat objected to the use of the machine, because it involved a certain amount of cruelty. Possibly enough means will be found to avert this in future, and it may be that the writer has been somewhat unfortunate in the examples he has witnessed; but he can only attest what he has seen with his own eyes, and that was that the sheep were somewhat mauled about by the clipper In the time test referred to the hand-shearers won easily, completing their score of sheep before the machine had finished its seventh, the time of the two men averaging, respectively, 4min. 51sec. and 5min. 3sec., while the machine had to be allowed time for readjustment now and again. Expedition was in this case the only test, and, as regards that, the hand beat the machine hollow; nor did the operators accomplish their feat in record time either, as a sheep has been shorn in 2½min. The sheep used in this contest were twenty Scotch wether hoggs and twenty half-breds, the latter being crosses of Scotch black-faced ewes and Wensleydales. It was put forward as an excuse that a novice had been employed to turn the handle of the machine, and on this account 20 per cent. of the time actually employed was wasted. It was admitted that the shearing of the machine was closer than that by hand, but that was the only thing that could be said in its favour.

FAT AND THE MILKING INTERVAL.

In the Wisconsin experiment station a herd of about thirty-eight cows and five bulls has been maintained for the last six years for the purpose of investigating the composition of milk, butter, and cheese. They have found out many things of practical use to the farmer. One is the vast difference in the quantity of food needed by different cows for the production of a unit of milk or of butter fat. Roughly speaking, the cows of the Wisconsin herd could be divided into three classes, of which one group produced 28lb. of milk, the second 23lb., and the third 18lb. of milk per day. It was found that on an average each group consumed very nearly the same quantity of food; the best cows produced 100lb. of milk on food containing 89lb. of dry matter, while the cows giving medium and low yields consumed for the same result 105lb. and 125lb. of dry matter. It is therefore obvious that cows giving the largest yield were by far the most profitable. The proportion of butter fat was not found to vary to any considerable extent by the style of feeding, but seemed to be determined by the inbred characteristics of the cow. Supplementary to this we may refer to the experiments made in the laboratory of the Agricultural College at Reading, which proved that a long interval between milkings leads to a diminution of fat, and this is supported by what has been ascertained at the Yorkshire College. It has always been a difficulty with dairy farmers that the morning's milk was poorer in quality than that obtained in the evening, and Dr. Crowther of the Yorkshire College holds that this can be amended by equalising the periods between successive milkings.

WHERE EGGS COME FROM.

Many people would probably be surprised to know from what different and distant countries the eggs come which are used in English households. Siberia exports enormous quantities of both eggs and butter to Western Europe, and the name of Egypt is probably even more unfamiliar as an egg-producing country for the English market. Yet during the last twelve months the export of eggs from Egypt very nearly amounted to the enormous total of 60,000,000, and of these only a seventh part were sent to other European countries than our own. The trade, moreover, is undergoing a period of depression at present, owing to the prevalence of chicken cholera on the Egyptian holdings, and the unwillingness of the fellaheen to take any preventive measures. On the other hand, these Egyptian eggs now fetch more than double the price they did seven or eight years ago.

VILLAGE BANKS IN ENGLAND.

According to the latest information that we have at hand nine village co-operative credit societies have now been established in England. Their object, as we need scarcely say, is to enable small cultivators such as market gardeners or allotment holders to obtain advances at a low rate of interest. The occasions when money is wanted are usually for the purchase of cows, sheep, and pigs, the paying of working expenses on small holdings and allotments, the repairing of tomato and cucumber houses, and the purchase of seeds and manure. The rate of interest varies, but is not allowed to exceed 6 per cent., or one shilling per month on £10. There are three Lincolnshire societies, at Scawby, Spalding, and Friskney; one at Hedge End in Hampshire, and one at Wigginhall in Norfolk, one at Freeby in Leicestershire, one at Clophill in Bedfordshire, and two in Worcestershire. The Scawby society was established in 1894, and in the first ten years of its existence lent out £1,032 in 38 loans. Last year it had 29 members and a reserve fund of £35. Its history is very typical of that of the others, and some good work has been placed to the credit even of those which were started only in the course of last year.

CORRESPONDENCE.

A CURIOUS MOUSE-TRAP.

[To the Editor of "Country Life."]

Sir,—The mouse-trap figured in Country Life of the 17th inst. is similar to one we always used in the forties and fifties of the last century, with the exception that the blocks were square and not round. The reason "E. Broughton" cannot set the trap is that the treadle is missing. It should be a round, thin piece of wood, with a projecting piece that will play up and down in the slit. There must be a notch cut across into which one end of the piece of wood on the string seen in the picture goes. The other end is placed in the notch which is visible near the bottom of the suspended block. Its weight will hold up the treadle A little meal should be put on the treadle; the mouse will enter, and its weight release the treadle. Death by flattening will be the result.—A. C.

NATURE NOTES.

[To the Editor of "Country Life."]

Sir,—Under one of your headings on shooting notes in your issue of Saturday, June 10th, you speak of nine stoats being caught in a trap in a hollow tree, one after the other; but I am inclined to think you ascribe the fact to the wrong reason. I do not think there is any special attraction for birds to nest or for vermin to frequent hollow trees, and I would ascribe the real reason to two facts which most gamekeepers know, or should, namely, that there is no bait for the weasel race like the dead body of a comrade, which they will come very long distances in search of, and that they are very easily snared. The nest of the magpie is, in my experience, nearly always in a deciduous tree, near the top, and has two entrances, one at each side, the nest being covered over on the top. This, no doubt, is to hide the eggs from passing crows, as well as to prevent the necessity of turning in the nest, which would injure the bird's long and handsome tail In your article on sea-birds in June, you say that the eider-ducks sit very close, even allowing one to lift them and count their eggs; but many birds will do this, it depending on how near the chicks are to leaving the shell. I lifted a sitting grouse once in the same way, but I found the eggs were all chipped.—Naturalist.

SEA-BIRDS NESTING INLAND.

[To the Editor of "Country Life."]

Sir,—My letter of the other day is not, I think, quite as plain as it might be. Of course it is no new thing for redshanks to nest inland, any more than for ringed plovers, dunlins, and oyster-catchers; but it seems to me interesting to find them seeking out new localities inland, especially those near London. It is, I think, rather an interesting fact that Middlesex should be found a locality for nesting of ringed plovers and redshanks, and also that sewage farms are proving so attractive to shore birds at all seasons of the year.—R. B. Lodge.

"DOWNRIGHT SHIPPEN."

[To the Editor of "Country Life."]

Sir,—In the admirably-illustrated account of Holland House which appears in the current number of Country Life, there is reference made to the "Downright Skipper." Pope has made us acquainted with "Downright Shippen," but who was the "Downright Skipper"?—Rutland.

[We are afraid that His Grace the Duke of Rutland must add one more to the long tale of printers' errors. "William Shippen," who was sent to the Tower in 1718, used to say of himself and Sir Robert Walpole: "Robin and I are two honest men; though he is for King George and I am for King James."—Ed.]

KIMMERIDGE COAL MONEY.

[To the Editor of "Country Life."]

Sir,—Except those with antiquarian instincts, probably few people beyond the confines of Wessex are familiar with these curious relics of a bygone age. To local tradition, which has so often handed down to us events of unwritten history, we owe the suggestion of the probable use of these interesting little discs. On the Dorset Coast, in the Isle of Purbeck, to the west of St. Alban's Head, an outcrop occurs of bituminous shale, which extends more or less for some miles. As a source of fuel this shale, or coal, has been worked from very early times, and is, to the present day, used by the cottagers of Kimmeridge, its chief drawbacks being an unpleasant odour and a smoke heavily charged with soot. Some of this shale is of so compact a texture that it is capable of being worked into ornamental articles, taking a

high polish similar to jet. The Romans, when occupying this part of Dorset, discovered not only the properties of this deposit as a fuel, but also its capabilities of being turned in a lathe into rings, beads, and armlets, which were, no doubt, readily purchased by the ladies in the important town of Durnovaria (Dorchester), a few miles distant. Some estimate may be formed of the magnitude of this industry by the number of discs which have been discovered from time to time in the neighbourhood, as they are, without doubt, the cores or centres left after turning articles of ornament. These discarded discs have been invariably found, carefully hidden away under the surface of the ground, at a depth of some 2ft., sometimes with or in Roman pottery, and sometimes between two flat stones, placed on edge, covered with a third stone at the top. That they were carefully stored and hidden away is beyond question, hence they must have represented some value to the possessor. It would appear reasonable to conclude that they were used by the Ancient Britons as tallies, or money. The turning lathe of the enlightened Roman was an instrument unknown in Britain, and these waste discs, bearing the tool marks of the turner, would have been as impossible to counterfeit by the savage Briton as a minted coin. That they have been known from early times as coal money is well authenticated. As many as 600 have been found together in one place, but always protected by covering stones, or pottery. In size varying from 1¾in. to 2½in. in diameter, and about ½in. in thickness, with holes to secure them to the mandril of the lathe, they are all strikingly similar in appearance.—Arthur D. Moullin.

A CHANGE IN THE LANDSCAPE.

[To the Editor of "Country Life."]

Sir,—I must compliment you on the possession of a delightfully imaginative paragraph composer. To write that "on very many of the Argyllshire hills the bracken is gaining on the heather and grass to a degree that quite changes the look of the landscape" may be poetic fancy, but like many other poetic fancies is diametrically opposed to hard fact. Perhaps your friend will give one instance out of the "very many." That bracken is increasing in some places, though not so much on the hills as in the glens, and especially where the land has at one time been under plough, is true; but the cause of the increase is the same cause that leads to the increase of thistles and other weeds, viz., the want of elbow-grease on the part of the farmer. The cattle theory is all nonsense. When does your friend suppose that sheep were substituted for cattle? If brackens are cut three or four times in May, June, and July for about four years, they gradually weaken and die down; but, as in the case of all weeds, they want to be attacked regularly. They are quite useless for every purpose except for sheltering a few early home-bred woodcock.—An Old Oxonian, Argyllshire.

[The kindly critic pays too high a compliment to the prosaic writer of the paragraph in crediting him with "poetic fancy" in saying that the aspect of the landscape in parts of Argyllshire is changed by the increase of bracken on the hills. The increase is virtually admitted by the critic himself, and it is no "poetic fancy," but mere "hard fact," that this increase changes the aspect of Nature as the green, and later the russet, of the bracken gains. As to the cause of the increase, the theory that the very great decrease of the cattle is largely responsible may be, indeed, "all nonsense" to the critic, but it is a form of "nonsense" that is preferred as an explanation, perhaps naturally, by many of the local people to that which this critic suggests. With his other remarks as to the mode of killing bracken and its practical inutility there can be no dispute.—Ed.]

AN OLD PIGEON-HOUSE.

[To the Editor of "Country Life."]

Sir,—I believe that pigeon-houses of the kind of which I send a photographare rare. Perhaps you may care to insert the enclosed in your paper; it was taken near Charlton, Wiltshire.—B. Ashton Warner.

AN UNEXPECTED BLESSING.

[To the Editor of "Country Life."]

Sir,—Five-and-twenty years ago I commenced bee-keeping with a stock sent me by that first-rate apiarist, my friend Miss Gayton of Much Hadham. I hived it in one of Abbott's large combination hives in the garden of this house. For many years I was supposed to be the only bee-master in this parish. I was too busy to attend to them with much care, and my hive became dirty, and on all sides I was advised to treat my old stock to a new

hive. This I did in the spring of 1903. They lived happily through that summer and winter, but early last summer they dwindled and failed. On inspection I found the hive absolutely empty, no bees living or dead. I was about to write and obtain a fresh swarm, when yesterday (fitting anniversary—it was Restoration Day !) I found my hive inhabited by a busy colony ! What has happened ? Did my old stock desert their hive, find a new resting-place, and send forth a colony who took possession of the forsaken home, or what has happened ? I do not know of any hive in the neighbourhood.—JOHN WILLIAM HAWKINS, Kensington.

BROWN-PAPER DRYING SHED.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Perhaps you may consider the accompanying photograph of sufficient interest to record in the pages of COUNTRY LIFE. I was reminded of the subject by the windmills in last week's paper. The buildings are two out of four or five in Mounton Valley, near Chepstow, and were built and used for the purpose of brown-paper drying, a process now out of date.—F. H. WORSLEY-BENISON.

YOUNG THRUSHES IN CAPTIVITY.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I am much interested in bird-life, and, as a constant reader of your paper, wish to ask if it is a common occurrence for parent birds, if able to reach them, to poison their young in captivity. A case has recently come under my notice of a young thrush caught and placed in a cage outside the house in which I am staying. The bird fed well, and was apparently in the best of health, till found by one of the parent birds, which was shortly seen to give it something through the bars of the cage. In half-an-hour the captive was dead. Local opinion says the parent administers a poisonous herb, preferring to see its young one dead rather than a prisoner. I should be glad to know if this is the case.—E. G.

[We consider that the idea of a bird poisoning its young is absurd.—ED.]

ANTS IN CAPTIVITY.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I notice so many correspondents writing to you on the above subject, complaining that their pets have run away, and speculating on the reason and the manner, that perhaps, as a keeper of ants before they became fashionable pets, I may be able to say a word or two of enlightenment. One correspondent writes that the ants ran away, and indicates some doubt of the reason of their dissatisfaction, also adding, though apparently without attaching the right significance to the observation, that the earth in the nest had grown very dry. The ants will not stay if the earth gets too dry. There are many ways of keeping it moist. I find the simplest to be to squirt in, with an ordinary ear-syringe, a teaspoonful or so of water when the earth begins to look dried up. This is easily seen by its assuming a light colour. It does not need to be all of a dark colour. If portions of it are darkened by the incoming water, it is enough. There need be no fear of drowning the ants ; it requires very prolonged immersion to kill them, and even if they have been immersed so long as to seem quite dead, they will often recover and be none the worse. Then, as to the manner of escape. One correspondent says that "Gamage's Entomologist" said that the ants which escaped were "yellow ants, not red." Probably they were the Lasius flavus, which is the kind generally sold. This is a very small kind of ant, and when the correspondent goes on to say that there was a gap through which an envelope could be passed at the window, the means of adequate egress is indicated at once, although the writer seems disposed to consider it insufficient. The writer is also disposed to question the ants' power to transport their cocoons up and down perpendicular surfaces for the space of some feet ; but I can assure the writer that I have seen a small worker of Lasius niger carry one of the big green cocoons in its mandibles for a distance of 1½ft. while it walked on the lower surface of a horizontal board, thus supporting, by the grip of its feet on the horizontal surface, not only its own weight, but also that of a body several times its own weight which it held in its jaws. Their power is marvellous. As for the departure of all the members of the nest at once, this is the regular way of ants' moving their quarters. A whole nest of my Myrmica nuginodis, which I had allowed to get too dry, decamped with all their cocoons, larvæ, etc., in a single night last summer, and must have travelled some 10ft. at least to effect their disappearance. In summer ants must be fed every week or so with some moistened sugar or honey. A drop or two at a time is enough for a large nest.—HORACE HUTCHINSON.

OUR BIRDS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—In your number for May 27th, on various birds, a subject that is always of very great interest to me, I notice your correspondent regretting the growing scarcity of house-martins. Now, I must tell you this year we have a very large number. As many as twenty-six rose together from the stable-yard one morning lately where the carriage had been washed. Also cuckoos this year are quite remarkable for their number, whereas last year both these birds were conspicuous by their absence here.—CHANDOS B. LU DAMER, Hereford.

KITTENS HATCHING OUT A CHICKEN.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—We found to-day a chicken of about two days' growth lying between two kittens three weeks old. The hens lay about in our old stables, where there are seven cats, none of whom, though wild enough, ever touch a chicken, big or little. I conclude that the heat of the kittens hatched the little, brown, short-legged beggar, whom we have removed under a hen whose eggs are breaking. The orphan is a sturdy chap, and I have made a scissors-cut on its poll to continue the identification. The case seems uncommon.—J. C. COOPER.

CHANTRY CHAPEL, WAKEFIELD.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I have pleasure in sending to you a photograph which is perhaps of more than merely local interest. It is the original façade of the Chantry Chapel, erected, in all probability, during the reign of Edward III., which stands on the bridge crossing the river Calder at Wakefield. Because of the ravages that time had effected on the structure generally, this façade was removed in 1847 to the private grounds of Kettlethorpe Park, two and a-half miles south, and replaced by a new façade designed by Sir Gilbert Scott. The deteriorating atmospheric influences have, however, acted so prejudicially on the later erection that it is by now in perhaps a worse state of decay than the original one.—ALEX. G. PATERSON.

EDITORIAL NOTICE.

The Editor will be glad to consider any MSS., photographs, or sketches submitted to him, but they should be accompanied with stamped addressed envelopes for return if unsuitable. In case of loss or injury he cannot hold himself responsible for MSS., photographs, or sketches, and publication in COUNTRY LIFE *can alone be taken as evidence of acceptance. The name and address of the owner should be placed on the back of all pictures and MSS.*

Those who send photographs are requested to state the price required for reproduction, otherwise when payment is requested it will be made at the usual rates of the journal. Only the actual photographer or owner of the copyright can be treated with.

Vols. VI., VII., VIII., IX., X., XI., XII., XIII., XIV., XV., and XVI. of COUNTRY LIFE *are now ready, and can be obtained on application to the Publisher. Price, bound in green half-morocco, 25s. per volume, or 21s. in green cloth, gilt edges. Vols. I., II., III., IV., and V. are out of print. All cheques should be made payable to the Proprietors,* COUNTRY LIFE.

On account of the regulations of the Postal Authorities, the index to Vol. XVI. of COUNTRY LIFE *is not included in the body of the paper, but it will be forwarded free to subscribers by the Manager upon the receipt of a stamped and addressed wrapper.*

The charge for Small Estate Announcements is 12s. per inch per insertion, the minimum space being half an inch, approximately 48 words, for which the charge is 6s. per insertion. All Advertisements must be prepaid.

THE FRUIT COMMITTEE'S . . RECOMMENDATIONS.

THE report submitted by the Fruit Committee appointed by Lord Onslow to enquire into the present condition of fruit-growing in Great Britain is a document of the utmost importance to all those who are engaged in the tilling of the soil. It may be hoped that some at least of the recommendations which it puts forward will speedily be passed into law, and be made practically effective. The most important of them is that a sub-department of the Board of Agriculture should be formed for the purpose of dealing with the subjects connected with fruit-farming. This they would have divided into two branches, one of them being a bureau of information and the other an experimental fruit farm. The main work of the sub-department would be to keep a vigilant eye upon the importation of fruit and nursery stock. This is a matter which receives the very greatest attention in France and other continental countries, and it ought not to be neglected here. Of course, the situation which has just arisen, and which gives point to the suggestion, is that owing to the cheapness of sugar we have become the great jam manufacturers of the world, and the co-operative societies of the Continent send us in large quantities of fruit and pulp to be made into jam and then distributed over the whole of the world. The trade is an immense and growing one, and Parliament will probably take care that in providing against adulteration and fraud nothing shall be done to check its legitimate development. Another proposal of the Committee is that horticulture should be taught in elementary schools in the country, and we fancy this recommendation will be generally accepted. It is the most practical form in which the new ideas of Nature teaching have found expression, and already in a considerable number of schools plots of ground have been found whereon the scholars exercise themselves in the rudimentary part of horticulture. The main thing is to keep this practical. It is of little use to teach such a subject as gardening merely by books and theory. Unless actual ground is available for the purpose it is impossible to imagine that much good will ever result from the teaching. And as a corollary horticulture ought to be made a subject in the training colleges, as it is well known to those who have practical experience that the greatest obstacle to Nature teaching and all kindred instruction in elementary schools, is that so few of the teachers themselves are sufficiently proficient to impart useful information to others. Obviously, if horticulture is to be efficiently taught in elementary schools, steps must be taken to prepare the country schoolmasters for teaching these subjects. The Committee also find that the present returns made by growers for land under fruit are deficient, and they desire that they should be improved and amplified. They would also like estimates of home and foreign crops to be published, together with forecasts of the probable date of arrival of imports. In fact, they desire the same figures in regard to fruit culture as Major Craigie gives in regard to the cultivation of cereal crops.

On the thorny question of legislation the Committee appear to have arrived at very distinct conclusions. Undoubtedly the most advantageous way of growing fruit is by occupants who own the holdings, as a long time must elapse before the planting of fruit trees can give a return which will pay for the initial outlay. It is the one case in which security of tenure is an absolute necessity to effective improvement; and security of tenure is no doubt best attained by proprietorship. The idea of the Committee is that a measure for the acquisition of small holdings should be brought into Parliament on lines similar to that of the Bill introduced by Mr. Collings in 1894. But a retrospective glance at the various attempts that have been made for the establishment of small holdings shows that none of them has been a real and permanent success, and the common impression amongst country people is that the provisions are too hard and stringent. Whoever brings in a Bill, therefore, ought to see that the financial proposals are sufficiently easy and attractive to induce industrious workingmen to invest their savings in small holdings. The Committee recommend that the various Agricultural Holdings Acts should be consolidated into a single measure with clear and simple provisions, and that the Market Gardeners' Compensation Acts should be amended by making Section IV. retrospective. This is one of the more controversial clauses of the Committee's suggestions, and it will probably give rise to a good deal of argument before a settlement is arrived at as to the actual steps to be taken.

The vexed question of valuation for the assessment of local and Imperial taxes is also very boldly dealt with. One of the grievances is that the assessment is usually raised immediately after planting. The recommendation is that in the assessing of agricultural holdings for local rates five years should be allowed to elapse after planting in the case of small fruit, seven where the plantations are mixed, and twelve in the case of orchards. In regard to the glass houses, it is proposed that the allowance of one-sixth should be increased to one-third. Another very important matter touched upon by the report is that of railway rates. The Committee suggest that a simpler and more uniform system for the transit should be made by the railways throughout the United Kingdom. We cannot think, however, that this recommendation will have any practical effect unless it is accompanied by a movement on the part of the fruit-farmers to regularise their supplies. In France, fruit is collected and marketed on a great co-operative system, which well might be copied in this country. By so doing the fruit-farmers in combination could send a regular supply, and it would be all the better if they agreed upon a particular type of box in which to despatch it. There is nothing in which the foreign fruit-grower shows to more advantage, in comparison with the English fruit-grower, than in the care and trouble he bestows on the package and despatch of his fruit. If our people would learn this from the foreigner, and also join together in order to send a regular supply, they would be in a position to demand from the railway companies much better terms than now are accorded them.

Our Portrait Illustration.

OUR frontispiece this week is a portrait of Lady Bertha Egerton and her child. Lady Bertha is a daughter of the third Earl of Lichfield, and married in 1902 the Hon. Thomas Henry Egerton, third son of the Earl of Ellesmere.

COUNTRY NOTES

IN extending a hearty welcome to Prince and Princess Arisugawa London is showing hospitality to one who is very familiar with it. The Prince is emphatically a modern product of Japan. From his seventeenth year he served as a midshipman in the Iron Duke, and afterwards was a lieutenant in the Channel Fleet, so that it was in the service of this country that he picked up that knowledge of naval matters which served his country so well during the war with China, and also in the conflict which has not yet ended. He is a very typical representative of his country, combining the freshness and force of the Orient with the knowledge that has been amassed during the centuries of Western culture. When the one is added to the other you get a race such as the Japanese have proved themselves to be.

The negotiations that have peace for their object drag along with somewhat weary footsteps. It would seem likely that in the end they will be successful; but meanwhile war is being waged with as much severity as though the idea of peace had never entered into the minds of the combatants, and unless Russia is able to make terms with her adversary quickly, it appears by no means improbable that the great army now in Manchuria will suffer defeat equal to that of her fleet. In saying all this it is, of course, quite clearly understood that peace could not be arranged at a day's notice. The issues at stake are very high, and it must be a very great humiliation for a country like Russia, which till this war broke out appeared so strong and was so proud, to yield to Japan, and, moreover, to pay an indemnity. There is every reason to believe that the finances of the Czar have been strained to their utmost, and, probably, there is more than a sentimental objection to paying the indemnity.

Except the Inland Revenue authorities, we cannot see how anyone is likely to be pleased with the report of the Departmental Committee appointed to enquire into the assessment and collection of the income tax. In their report it is said that the income tax appears on the whole to be levied with a minimum of friction and a maximum of result. We have not the evidence before us on which this sweeping statement is based; but it will be news to most people that this tax is collected with a minimum of friction. It is the most inconvenient and distressing of all the burdens that are placed on the shoulders of the middle classes. The man with an income of, say, £500 a year, who has to educate his children and keep up a certain position, usually about Christmas-time finds it sufficiently difficult to pay all the bills that come in; and it is just at that inconvenient moment that the Inland Revenue authorities begin to press for income tax. It would be felt much more lightly if it could be paid quarterly. As it is, the tax is quite a heavy burden, and has begotten more discontent than any other levy made on the citizen by the State.

In regard to the question of evasion, no doubt the Committee will meet with a certain amount of support. If a tax is to be levied by Government, every reasonable means should be taken to see that one citizen pays his share in the same way as the others, and nothing can possibly be more unpatriotic than to take any dishonest or questionable means to shirk this plain duty. At the same time, the Inland Revenue authorities ought to be cautioned against introducing anything that is too inquisitorial into their methods. Perhaps in the great towns this is less resented than it is in the provinces, where, very often, the person responsible for collecting the tax is in a position of equality with those who have to pay, and in some cases it is very far from pleasant to have to disclose one's affairs to a neighbour. Cases happen more frequently than might be thought when an income is actually exaggerated for the purpose of deceiving the too curious eye, and as politicians have openly promised over and over again the abolition of this tax, which in its inception was meant only to meet the expenses during the time of war, it would be ill-advised to adopt the somewhat harsh measures proposed by the Committee.

Occasionally even a Blue Book is interesting, and the annual abstract of the labour statistics just issued by the Board of Trade contains, in the shape of a list of figures, a most interesting indication of the conditions of English life. We refer to the part in which a comparison is made of the number of domestic servants kept in various parts of the country. It will be remembered that Carlyle defined respectability, in sarcasm, as ability to keep a gig; but if he had said to keep a domestic servant, he would have been nearer the truth. In Hampstead 81 per cent. of the families keep domestics, and in Kensington about 80 per cent.; but there are only four boroughs in London where over 50 per cent. of the families have reached that dignity—Westminster, Chelsea, Marylebone, and Paddington. In Stepney, Finsbury, Poplar, Southwark, Bermondsey, Bethnal Green, and Shoreditch only from five to eight families out of 100 are able to keep servants. The provinces, judged by this test, are much poorer than the capital; except at a few resorts of rich people, such as Bournemouth and Eastbourne, there are no provincial towns in which the percentage rises above 25. In Birmingham it is only 11, Manchester 10, Sheffield 13, Cardiff 14. Newcastle appears to be one of the very well-to-do provincial towns, for 17·4 per cent. of the householders keep servants, while Burnley, by the same token, is the poorest.

THE BROOK.

Hastens the laughing brook
With current fleet,
As does the joyful heart
Its fate to meet:
The streamlet seeks the mighty river's breast,
The heart an ocean broad of love and rest.
Lightly are lovers' thoughts,
As rippling waves
Lost for a moment's space
In darksome caves,
Shrouded in sadness, to emerge again,
Dance in the sunlight and forget the pain.
Swiftly a flower droops
'Neath darkened skies,
When sunbeams cease to kiss,
And slowly dies.
So must the heart its sweet affection give,
Or, ceasing once to love, must cease to live.

BERNARD MALCOLM RAMSAY.

On another page will be found some account of the opening of the Royal Agricultural Show at Park Royal. For once its meeting has begun in good weather, and we trust that the fair skies will be an omen of better fortune with regard to the exhibition. Much as we may occasionally criticise the conduct of the Royal Agricultural Society, everybody knows that the show of livestock which it gets up annually is not only the best of its kind in England, but the best in the whole world, and whoever has a taste for what is finest in agriculture would never like to miss its show. The only reason for its not being so successful as some of the other societies is that those who manage it have hitherto disdained to cater for the masses They have, as it were, played to the most fastidious tastes only, and the penalty of their having done so has been a certain dulness that the general public will not abide. But perhaps after this year visitors will try to be more appreciative, and the Royal, on its part, will try to combine an undiminished excellence with a certain gaiety that is always required in the management of a crowd.

A well-deserved tribute was on Tuesday night paid to the well-known auctioneer, Mr. John Thornton, who has for more than a generation presided over the more important cattle sales of the kingdom, and whose name is especially associated with the breeding of shorthorns. The King only expressed the general opinion when, through Sir Dighton Probyn, he sent a message to say how satisfied he had been "with the way Mr. Thornton has always conducted the many sales he has had charge of both at Sandringham and Windsor for many years past." Mr. Thornton's address contained so many interesting reminiscences that it makes us wish the speaker, in the leisure which we understand he now proposes to enjoy, would amuse himself by writing his memoirs, which should cast a brilliant light upon the history of stock-breeding during the last generation.

There are in France at the present moment twenty-two Government studs, distributed among which are 4,000 sires, all of them pedigree horses of the highest class—Arabs, Anglo-

Arabs, trotters, hackneys, along with Suffolks, Clydesdales, Shires, Percherons, and other breeds suitable for purposes of draught. Each of these is connected with a number of smaller establishments, to which at the proper season a certain number of sires, adapted to the wants of the district, are sent, and by this means a network of studs, containing absolutely sound sires, is established throughout the country. Every inducement is given to farmers and breeders to avail themselves of the services of these stallions, and the fees demanded for their services are extremely small; the owner of a thorough-bred mare, for instance, can obtain the services of a sire of the class of a winner of the Derby for from £4 to £12.

A paragraph which appeared in the papers last week described the age of agricultural labourers in Huntingdonshire as being abnormal. At a show in the district prizes were taken by a man of sixty-five who had worked on the same farm since he was ten, and by another man of seventy-eight who has been for forty-five years in the same service. A writer in one of our daily contemporaries seems to think that this affords proof of the labourer being too dependent on his employer. If it had been otherwise, he argues, the men would long ago have tried to better themselves; but the wages paid in Huntingdonshire during the period that these men have been at work have been only about 12s. a week, and this would have been insufficient to afford them a livelihood but for certain indirect advantages which they draw from the farm and which they could not give up. We do not believe very much in the force of this argument. In many parts of the country agricultural labourers move annually, and it is only where there is an exceptionally good understanding between master and man that long service is possible, and in this case there is something more than a mere cash relationship between them—there is loyalty on one side and protection on the other.

The discovery has been made by the Swiss Topographical Department that the accepted altitudes of all the mountains in Switzerland are incorrect by about 10ft. These altitudes were officially calculated from the level of the block of stone in the Lake of Geneva, believed to have been used in Roman times as an altar, and known as the Pierre à Niton, on which, in 1820, a bronze tablet was placed, recording what was believed to be its exact height above the sea, to serve as the standard for all national surveys. Now it has been discovered that, owing to an error in calculation, the height of the stone above sea-level was made 3·26 mètres too much, and the officially registered altitude of every point in the country is thrown out accordingly. Though the difference is small, it is enough to bring certain peaks of the second and third ranks in the French, Italian, and Austrian Alps above others in Switzerland hitherto believed to be the higher.

The spell of wet weather seems to have done much good to the hops. They have come on as if with the intention of making up for the time lost and the check caused by the severe frost of the late spring. In the centre and east of Kent they appear in better case than in the west of the county and across the Sussex border. Cherries, on the other hand, which seemed a promising crop in West Kent, have not come on as they should during the last week or so, perhaps for lack of sunshine. They, unlike the hops, seem to be better as one goes west.

The very singular behaviour of the barometer during some recent changes of weather has been very remarkable. The remarkable point is that while the weather has changed very considerably the glass has changed so very little. During all the prolonged spell of dry weather the glass was relatively low—low considering the drought and the easterly direction of the wind. Then came a change, in the Southern and Eastern Counties more marked than elsewhere, to a continuance of heavy rain. The barometer fell very little at the commencement of this, and through it all remained extraordinarily stationary. Now, at the time of writing, the weather is inclined to mend its ways, and the barometer has at length consented to overcome its inertness and is rising slowly.

Some interesting facts and figures are given in the last general report on mines and quarries in the United Kingdom, which has just been published as a Blue Book. Mines that are worked under the Coal Mines' Act amount to the curious number of 3,333, employing between 800,000 and 900,000 workers, of whom a little over 80 per cent. occupy their business underground. Between 5,000 and 6,000 women are employed in surface work connected with the coal mines. Comparatively a small number of workers—between 29,000 and 30,000—are engaged in the other mines, and in quarries between 97,000 and 98,000. The total output of coal was just about 232,500,000 tons, and of other minerals about 3,250,000 tons. These are figures that may somewhat assist the mind in the scarcely-possible task of forming a conception of the proportions of this immense industry.

One of the measures to which we were exhorted at matriculation to the Universities was to "abandon the proud habit of wearing boots," a measure originally framed with reference to the high boots of the cavaliers, as we were told. The undergraduate of the present day appears to have abandoned in large degree the proud habit of wearing hats or caps or any kind of headwear. Whether the object of this is to keep his head cool or his hair on, it is likely that it may have some useful effect in both directions. Hatlessness in the country is becoming quite a feature of men's attire to-day. The Prime Minister hardly ever wears a hat at golf. It will be interesting to see whether the growth of this fashion will produce appreciable results on the general growth of hair. At present the tendency seems rather towards an early baldness, which would have been considered very premature by our robust and hirsute forefathers.

A substantial step has been taken towards the realisation of a canal scheme of European importance by the action of the Würtemberg Diet in voting a grant for the canalisation of the Neckar from Mannheim, where it joins the Rhine, as far as Heilbron. This is a considerable section of the entire Rhine and Danube canal, which, when completed, will provide a means of inland navigation all the way from Rotterdam to the Black Sea, and will probably promote the interests of British as well as German commerce by providing easier access to Central Germany and an alternative route to the Danubian and Black Sea ports. At the same time, the Prussian Landtag has finally authorised an immense programme of canal construction which covers almost the whole of Northern Germany, and is estimated to cost more than twelve millions sterling.

THE MALVERN HILLS.

Hills of my heart, dear native hills,
And all ye meadows, woods, and rills,
From whose fair scenes my mind hath caught
A tone of sweet poetic thought;
I would before my voice is dumb,
Ere yet the silent hour is come,
That I in flowers of song might dress
Each turf with everlastingness,
And shed on every herb and tree
The dew of immortality.

For here, here only have I found
A charm that never tires, a sound
That keeps its music, here have heard
The Incommunicable Word
The soul doth to itself express
When touched with Nature's loveliness;
And here have known those deeper moods
That haunt old wandering solitudes,
Until their calm and peace have grown
To be my heart's prevailing tone.

And so I want to leave behind
A song stirred ever with the wind,
And golden with the light that fills
Your airy paths, beloved hills—
A thing of living breath and bloom
To cheer the close and narrow room,
To fill the empty hands with flowers,
To fall on weary hearts in showers,
And lead them on by summer streams
To higher thoughts, and purer dreams.

R. G. T. COVENTRY.

The determination of Pope Pius X. to spend the summer months in a country residence may have a far-reaching effect on the life of the Italian kingdom. His resolution marks the abandonment of the fiction that the Pope is a "prisoner in the Vatican," by which his predecessors since the establishment of the secular Government in Rome have recorded their protest against the existing order of things. He has also issued an encyclical to the Italian bishops which permits strict Roman Catholics to vote in elections and otherwise take part in the politics of the nation, in a way which has hitherto been banned. The establishment of the United Monarchy has wrought such great and real benefits in the condition of the Italian people that every friend of the country will be gladdened at the action of the ecclesiastical power in abandoning its policy of aloofness. For the future it is to be hoped that the participating of the Church in Italian politics will add both strength and harmony to the course of the national life.

The penalty of six months' hard labour imposed on a chauffeur who was found guilty of causing the death of a child by reckless driving ought to serve as a salutary example. We do not think the fault is one common to motorists as a class, but here and there a single reckless individual, by his carelessness of public safety, does much to discredit all who have motor-cars, however innocent they may be, and we believe it will generally be recognised as an act of justice that punishment should be meted out to the offender as in the case we have referred to.

FLAMBOROUGH HEAD.

AMONG the many pleasant trips made by the members of the Ornithological Congress, which last week concluded its visit to England, few are likely to leave a more vivid impression on the minds of foreign visitors than that to Flamborough Head. In itself the change from London to Yorkshire is almost violent in the shock of contrast. Even those who are rapt in the fascination of ornithological study in the museums must feel some of that repulsion which London excites in June. The sunlight is rendered more glaring and unbearable by the flash of shop windows and the noise of traffic, the dust seems more choking, the odours are strongly developed. But four hours of railway travelling effects a magical change, and as the ornithologists went from Cambridge, even this was curtailed. Instead of the smoke and turmoil of streets, Yorkshire stretches out her green, cool moors, with the brilliant patches of gorse still showing signs of the withering gold that was in its glory a few weeks ago. Here and there a cottage with rustic inhabitants stands amid, but does not break, the green expanse. Trees in their dense summer foliage shake their wind-ruffled leaves over spots rendered cool by their presence. And the very birds seen from the carriage window differ from those of London. We do not disparage the alert, impudent, suspicious, yet friendly, sparrow of the streets, or the pigeons that coo and court

Photochrom Co. *KING AND QUEEN ROCKS.* Copyright.

C. Reid, Wishaw, N.B *SCALES NOOK.* Copyright

and feed near our public buildings, or the cushats that have taken up residence in our parks and gardens, and add their sweet cooing to the raucous noises of the town. Far less are we inclined to ignore the bird inhabitants of our parks. But the country birds are different. The rook winging his way from field to spinney, the cushat caracoling in mid-air, the lapwing, and the little song-birds are at once fresher in plumage and wilder than their town cousins. And it may seem a paradox to say it, but they are more business-like. Your town bird is gross and waxes fat. He is full of crumbs. The ducks waddling along the Serpentine are killed with kindness, while your bird of the fields is a toilsome wight. Every day he must forage for his own provender; and just now, when there are so many eager little beaks to be filled, he is often puzzled to make both ends meet.

True as this is of the inland country, how much more applicable is it to the seacoast; especially is it so when the seacoast is that of Yorkshire. It may be said with perfect truth that a summer sea cannot be anything but fine. And East Anglia shows every variety of it. Come to Lincolnshire, and you shall see wide, low, level sands, beyond which the tide retreats till the wave seems fading away into the horizon; back again it comes in wandering ripples till what was a dark expanse glitters a radiant silver sea. Beach, shingle, rock, cove, and sand may all be studied here, true though it be that the general conformation of England is to offer a low and crumbling shore on the eastern side, and on the west, stern and rugged barriers of rock, the outlying guards of our great mountain ranges. Yet on the East Coast the exception proves the rule, and Flamborough Head is as wild a headland as is to be found even on the opposite side of the island. Against the bases of its precipices, and into the clefts and hollows, the sea-water comes pleasant and crooning in summer, and in winter with a range of madness and a voice of thunder. A perpetual warfare goes on between the water and the rock.

In prehistoric ages, before the great revolution which changed the climate of Great Britain from the torrid character that produced our great coal-mines to its present condition, the continent of Europe and the British Isles formed one continuous mass, a theory for which considerable testimony has lately been found in the discovery of the remains of a dense forest, the site of which is now covered by the sea. So the clefts and stacks at Flamborough show where the breaking wave has been perpetually hurling itself against the solid rock and gradually wearing it away, hollowing out caves and holes in places. Even in summer its cool ripple, though it breaks softly against the bases of the rocks, tells of the long process that has been going on, not only during ages, but æons of time. As might be expected, the natural inhabitants of the seacoast have found a sanctuary on Flamborough Head. It has everything to recommend it to them, and in former years must have been a very solitary place, to which it was difficult to get. We speak of the era before railways had been built. The inland dales were almost impenetrable, and the late Canon Atkinson, in one of the most charming of his books, told us how rude and wild the country was about Danby when he first went to it, while Goathland is chiefly known away from the district for the place it holds in legendary lore. It was the men of that vale who are said to have walled in the cuckoo in order that summer might be always with them, and a great many of the like absurdities have been fathered on them, though, no doubt, in reality they are just what other people in Yorkshire are. But till a very late date all the country round about Flamborough was inhabited by a set of rude and wild but most kindly dalesmen. Robin Hood's Bay, in spite of the ease with which the Great Northern and North Eastern Railways enable the tourist and tripper to reach it, with its bold, strong outlines still gives us a sense of remoteness. The fisher-folk, who always like to have the sea as near as possible, built their houses so close to it that a few years ago, during a heavy storm, a fishing-boat that had been wrecked and driven ashore was the means of killing a man in his own house, as the main-mast actually penetrated his window.

Specimens of the old inhabitants are still to be found in the little group of cragsmen climbing the cliff and gathering eggs. They seemed to excite a great deal of astonishment in the minds of many of the foreign visitors who had not seen birds'-nesting done in the same way before, although it is common enough in the wilder of the Scottish islands and on many parts of the East Coast of Great Britain. Several clutches of eggs were taken away by the visitors for the purpose of being hatched out

C. Reid, Wishaw, N.B. *A VAST FISSURE.* Copyright.

and the chicks acclimatised, and it will be very interesting indeed on a future date to learn the results, especially if the young birds can be induced to breed and nest amid their new surroundings. In regard to the various species to be found here, Flamborough Head does not differ essentially from the other places which we have from time to time illustrated in our pages, such as Lundy Isle and the Farne Islands. There are immense flocks of guillemots and puffins, and more gulls and cormorants than are altogether desirable, for these birds become more destructive annually, the gulls playing havoc with the eggs of some of the sea-birds that it is most desirable to preserve, while the fisher population is very indignant and angry at the greed of the cormorants. We are afraid that it is impossible to set up any valid defence of them. Since the Wild Birds' Protection Acts came into operation they have benefited by a solicitude that was never meant for them in the beginning, and during recent years have increased in numbers to an enormous extent, in the winter haunting the rivers and estuaries, and at all times of the year consuming an amount of fish quite incommensurate with their size. Without wishing in any way to diminish the number of sea-birds we cannot help regretting that a few breeds should flourish so extensively at the expense of the rest. There are several, like the roseate tern, which are so beautiful that one would like to see their numbers increase, but the number that breed in England every year seems to grow smaller and smaller. No doubt this is partly due to the thieving propensities of the larger gulls, which hover over the nests of the terns and steal the eggs whenever a chance is afforded by the absence of the mother bird.

Standing on the bold seacoast at Flamborough one would be rash to condemn any of the sea-fowl, for of all the ornaments which have been given to "this dim spot which men call earth," those creatures sailing about on their white wings, or diving into the deep blue water, are the most graceful. In olden times a writer who belonged to the ecclesiastical establishment at Whitby, and who probably spent many an hour gazing out on the same sea view that meets the eye of the modern to-day, designated the sea as the "gannet's bath," as though the solan goose was the important object, and the great "unharvested" existed only for its convenience. So might we think to-day, standing on this remote portion of the East Coast and scanning the ledges and crannies of the cliffs where so many birds have tried to make procreant cradles, while their mates may be seen floating on the wave like tiny barques at anchor, or winging hither and thither, passing over rock and sea, or scudding along the surface in search of food. Summer has scarcely any more beautiful sight to unfold.

It may be heresy to say so, but we cannot altogether approve of the example set by the ornithologists of carrying away so many eggs. If everybody who visited Flamborough Head were to take as many, there would soon be a diminution of the supply. Besides, the ornithologists had had just previously an excellent opportunity of studying a collection of eggs during the course of their expedition to Cambridge. Professor Newton, who is one of the foremost ornithologists of his time, and has written many standard books on the subject, showed them his extraordinary collection, which includes among other treasures eight eggs of the great auk. He had also many fine examples of eggs of the osprey. At Ditton Hall, too, the excursionists were afforded an opportunity to inspect the aviaries of Mr. J. L. Bonhote. It was a pleasant surprise, probably, to the majority of those present, for this is an almost unrivalled collection of birds, the main feature of which is a unique collection of hybrid ducks which Mr. Bonhote has been at such pains to get together. The storks, cranes, bitterns, herons, owls, buzzards, kites, kestrels, small wading birds, gulls, cormorants, and small passerines, including bearded tits, claimed general admiration among those who were present; the housing is so perfect, and the birds in such excellent health. On the previous day the members were at Woburn Abbey, where the treasures of the Duke and Duchess of Bedford were carefully inspected. Among the birds the most noticeable were the ostriches, the rheas, and the water-fowl. There is an extremely fine collection of the latter, including a number of flamingoes, which could be seen swimming. Altogether the visit to England must have had a very enlightening effect upon

C. Reid, Wishaw, N.B. *GUILLEMOTS ON LEDGE.* Copyright.

the foreign members of the Ornithological Congress. This island of ours, small though it is in comparison with the great continents, nevertheless seems extremely favourable to the development and nourishment of wild life.

WILD COUNTRY LIFE.

Concerning Herons.

After watching a heronry in Sussex for many seasons, I find it difficult to account for the disposal of the natural increase which each spring assuredly brings round. What becomes of the young birds which are added each year to the previous muster of the district from which the heronry is recruited? Some of the young birds undoubtedly return to the heronry in succeeding springs, and form part of the pairing birds. Others, I believe, seek new homes elsewhere, and probably take long migratory journeys. Our grey heron has a very wide range, and is found not only in most parts of Europe, but through Africa as far south as Cape Colony, where it is common, and in Asia as far eastward as Japan. It is found even in Australia. There can, I think, be little doubt that a certain number of our British herons migrate periodically, and that some proportion of them make homes and breed in distant parts of the world. Otherwise it would be difficult to account for the surplus population of these birds breeding in this country. In England and Wales, for example, there are not less than 133 heronries, of which the county of Norfolk alone supports 14, Ireland supports 72, and Scotland about 52 heronries. Most of these heronries are fairly well attended in the nesting season, and the annual increase must be far more than enough to keep up the average supply in these islands. The heron has not many enemies; it is not liable to the attacks of foxes, stoats, weasels, and other furred ruffians. These birds may suffer at times from the assaults of the egg-devouring rook and carrion crow; but, from my own observation, they are quite able to defend themselves from these marauders if they choose. Hawking, which in the old days took heavy toll from the heron's legions, is at the present time scarcely to be reckoned with; and the number of grey herons killed in Britain by falcons, whether tame or wild, must be very few and far between. Where fish hatcheries are at work, herons, which are undoubtedly immense devourers of fish, have, of course, to be kept down; but the heron is, in truth, a grand ornament to any landscape, and the sight of one of these great birds flapping its way homeward across a clear evening sky is one that lingers long in the memory. Then one has to take into account the fact that herons have, with many other birds, benefited considerably by the Wild Birds' Protection Acts of the last thirty years. Upon the whole, one is inclined to agree with those who allege that the heron is now more plentiful in England than it was five-and-twenty years since. But even taking into account this fact, it is, I think, difficult to resist the conclusion that, allowing for the natural and unnatural death-rate of these birds, there is a steady annual surplus increase in the number of British herons. As this surplus population is not to be accounted for by the numbers of birds seen about the country-side, it is, I think, pretty certain that each year a considerable number of grey herons migrate to other countries. Some of these birds probably return for the nesting season; others remain and become colonists in the new lands to which they have winged their way. It is not by any means impossible that herons pass occasionally to and fro between even far South Africa and Britain, as do, undoubtedly, other British birds.

The Cormorant's Appetite.

A heron will certainly, if he gets the chance, devour as many as a score of small trout in a single day. He is provided with extraordinarily good digestive powers, and assimilates even the bones of his prey. But in districts where eels are plentiful I am persuaded that this bird's dietary consists largely of these creatures. Certainly on the Pevensey and other marshes of Sussex herons subsist for the most part on the eels which swarm in the muddy dykes of these localities. But, compared with the cormorant's appetite, that of the heron is by no means unreasonable. The heron has not yet attained the uneasy distinction of being legislated against by local county councils. In Devon, for example, cormorants and shags are not only exempted from the benefit of the Wild Birds' Protection Acts, but on the Exe, Teign, and Dart a reward of a shilling a head is actually paid for their destruction. In the Isle of Wight they have also been withdrawn from protection. A truly hoggish bird is the cormorant; his appetite seems never absolutely satisfied, and he will devour readily from 6lb. to 8lb. of fish in a single day. Some assert that he devours more than his own weight (about 8lb.) during the twenty-four hours. It is small wonder then that where these birds have from protection grown over-abundant, especially in districts through which important fishing rivers pass, as in Devon, the local authorities should have found it necessary to legislate against them.

The Cormorant's Transformation.

On land the cormorant is, undeniably, an ugly, forbidding, and ungainly creature. Even Milton has represented Satan as entering Paradise in the form of one of these creatures. But in the water the bird becomes instantly transformed, and in that element each one of its actions is endowed with amazing grace and the very perfection of swift and sinuous ease. He who sees a cormorant dart after its prey in a tank or pond, where its movements can be closely followed, cannot fail to admire the astonishing facility of the creature, or the wonder of its lightning-like rushes through the solid water, which seems to offer but slight resistance to its passage. Faster than the eye can follow, almost like a flash of light, is the submarine swoop of this bird; it turns and twists like a snake, and few fish indeed, swift though they are, stand much chance with a cormorant upon anything like even terms. In a confined space, such as a pond, the bird has all the fish practically at its mercy. Having completed its angling operations, the bird seeks a rock or stump, repeatedly flaps its wings, to get rid of the water and dry itself, and thereafter suns itself drowsily in the warmest rays that offer themselves, the embodiment apparently of a clumsy and over-gorged stupidity.

The Stone Curlew.

In April last while riding on the Sussex Downs, between Eastbourne and Folkington, I put up a stone curlew, or Norfolk plover, from some long rough grass The bird got up quietly close to me and went down again 40yds. away. In order to make quite certain of the identity of this somewhat rare British bird I rode back and put up the plover again. Anyone who has used the shot-gun much in South Africa is sure to be familiar with the dikkop, which is a very near cousin of our English stone curlew. Few sportsmen who have shot over the rolling grass plains of the Orange River Colony, the Transvaal, or Bechuanaland have failed to add to their day's bag of redwing, partridge, and Koorhaan bustards a brace now and again of the dikkop (literally "thick-head"), which gets up, like its English cousin very quietly, is easily brought down, and is excellent eating. Our English Thickree plover—another name for these birds—which still visits us in small numbers each spring, is nowadays far too scarce a creature to be classed as an edible bird. It is, of course, also protected, nominally, though the casual gunner shows, I am afraid, but scant mercy when he comes across so unfamiliar a fowl. Here and there in quiet parts of Sussex, Hants, and East Anglia the stone curlew still breeds, albeit it must enjoy, one fancies, but a

W. A. Rouch. *PLAY IN MID-FIELD.* Copyright.

shuddering kind of existence. The egg-collector, that bane of our scarcer British birds, is, for example, always on the look-out for such rarities, and the clutch of a Norfolk plover is worth good money to the rustic labourer or shepherd. Stone curlew, by the way, is a rural misnomer which is never now likely to lose its popularity. There is nothing of the curlew about this curious semi-nocturnal species, and its long legs and mournful whistle are scarcely sufficient resemblances to have warranted this now long-familiar name. As this plover has a wide range, and is found not only in temperate Europe, but also in North Africa, the Atlantic islands, and parts of Asia, it will, no doubt, despite much persecution, continue to pay periodical migrating visits to these islands. H. A. B.

POLO NOTES.

THE Champion Cup tournament of 1905 has been neither uninteresting nor without incidents, accidents, and surprises. Yet, although mishaps put Captain Miller practically out of the game on Thursday, and spoilt the final on Saturday by injuring Mr. Freake, we must, I think, conclude that the best team won in the end when Roehampton carried off the trophy on Saturday. They began well on Monday by beating Mr. Grenfell's team by the considerable margin of 12 goals to 2, and this was a better performance even than it looks on paper, because the latter team were a good one, consisting of two Messrs. Grenfell, Mr. Courage, and Mr. E. B. Sheppard. Roehampton, however, gave a further sign of their strength when they defeated the Wanderers on Thursday in most decisive fashion. But the Wanderers had played on the previous Tuesday one of the closest matches of the tournament against Handley Cross. This is the team that came near to winning the cup last year. Wanderers *v.* Handley Cross proved to be a most desperate struggle. The game was full of hard hitting and hard riding, and was a struggle of which every moment was closely fought out. Not till after extra time had been allowed did Mr. J. B. Dale hit the winning goal for the Wanderers; yet when on Thursday afternoon that team met Roehampton they could make little or no impression on them. It was, I think, this game that showed us how strong a team Roehampton are this year. They have just now an extraordinary goal-getter in Mr. Cecil Nickalls. I saw him hit three successively on Monday, and he was little less successful during the other matches. Then Mr. P. W. Nickalls is an excellent back player, and was well supported. It is his quickness which is not the least notable feature of his play; he has besides a very pretty style and is a good horseman. The Nickalls brothers have adopted a not less effective but more restrained style of riding off than they used to have. But, of course, many people expected that Rugby, with Mr. George Miller back in his place, the best of ponies, and a combination that no other team can equal, would have won after all. This opinion was a good deal changed when it was seen on Monday that Rugby —Mr. Walter Jones, Mr. George Miller, Captain Miller, and Mr. C. D. Miller—could hardly hold their own against the Magpies—Captain Jenner, Mr. Thynne, Mr. H. Brassey, and the Duke of Roxburghe. The latter team played a magnificent game, and their back was most difficult to ride off, while Captain Jenner, especially when riding one or other of his two dark brown ponies, was in brilliant form. The Rugby team were playing well, yet they could make no impression, and they quite failed to score after two attacks which each lasted several minutes. Then we saw the most trusty ponies brought out—Luna, who never failed yet to respond to a call on her in a hard-fought tournament; Syren, who is one of the most trustworthy, as My Girl is one of the easiest, ponies to start or turn; old Nipcat, too, I thought I saw, or one very like her. But there were good ponies on the other side—Captain Jenner's browns and Mr. Brassey's grey, and a fine weight-carrier of the Duke of Roxburghe. So well did the Magpies play that, if Mr. Brassey had been able to remain on the ground, and the umpire had seen a rather obvious offside, Rugby might have been put out in the first round. They survived, however, only to fall on Thursday before the Old Cantabs—Captain Heseltine, Mr. F. M. Freake, Mr. W. S. Buckmaster, and Mr. W. McCreery. This was a well-mounted team, for Mr. Buckmaster had the loan of Mulatto, a wonderfully steady brown pony which he has played in many tournaments. She is now, I believe, the property of Mr. Garland of Moreton Morrell. Then, besides this mare, Mr. Buckmaster has a speedy dark grey four year old. It certainly looked as if, when once away, none of the others could catch it. Mr. Buckmaster made some good runs with this pony, which yet is not a mount to suit everyone, and was very eager in riding off, and certainly his new ponies seem apt at the lesson. So far as I could see Mr. Freake's bay was actually the fastest pony on the ground when once in its stride, and one glorious run there was when this pony stretched after the ball at a level easy stroke, and Mr. Freake, sitting easily, hit the ball full and clean, till at last a fine stroke taken at full speed secured a goal, which stirred all those who saw it. One spectator, moved to enthusiasm, declared that Mr. Freake was the second best player in England, and, perhaps, he was not far wrong. Mr. George Miller had, during one ten, one of Lord Shrewsbury's long-tailed

W. A. Rouch. *A SCRIMMAGE NEAR THE BOARDS.* Copyright

thorough-bred ponies. This chestnut, Marengo, seemed wonderfully handy and yet very fast. Mr. George Miller has the credit of preferring compact, handy ponies, but he was quite at home on this one. More of the compact type was another pony lent by Lord Shrewsbury to the Rugby team—Bayleaf, not to be confounded, by the way, with Mr. C. D. Miller's prize-winner of the same name. This is a noteworthy pony. Its white blazed face makes it easily distinguishable. It is, as a pony should be, always on its toes ready to start or turn, yet I have excellent authority for saying that it is quite easy to ride, though as sharp as a pony can be. The Old Cantabs won the match after a fine struggle, the close of which was marred by the mishap, referred to already, to Captain Miller, who, though he held on pluckily, was not really fit to play any more. The final score was 4 to 2. Taking everything into consideration, the Old Cantabs were evidently back to their old form, and we eagerly discussed the question whether they could beat Roehampton; but on Saturday last the Old Cantabs had bad luck. Mr. Freake was hurt early in the game, and Captain Heseltine only was quite in his right form; therefore, Roehampton won after a poor finish to a good tournament by 5 goals to none. A very much closer and more exciting match was that between the Rotters—Mr. W. B. Burlon, Mr. J. Bellville, Captain G. Phipps-Hornby, and Mr. R. Newman—against the Mosquitoes—Messrs. J. Gouldsmith, Noel Price, J. W. Hornsby, and Captain F. Guest. This was the final of the Novices Cup. Of some of the earlier play in this tournament I have written above. A large entry and close matches marked its course, and after a close struggle the Rotters won by 5 goals to 4. This was a satisfactory conclusion to an interesting tournament, which began on Monday. X.

W. A. Rouch. *THE ROEHAMPTON TEAM.* Copyright.

FROM THE FARMS.

The Hay Harvest.

During the course of last week hay cutting was very generally begun in the South of England, and in a few places the crops are already housed, as many farmers do not think it good to leave hay out in the sun so long as their forefathers used to do. On the whole, we are afraid that the crop is going to be a short one; at least, that is the impression produced in our minds by going over a considerable number of fields where the hay was being cut. One slight advantage is that the reaper is able to do its work very much more expeditiously, and, should the weather remain dry and hot, the hay season will, so far as the South of England is concerned, be over and done with in the course of the next few days. From the North we hear dubious reports. While rain poured down on London streets, the drought persisted in the North of England, and in Scotland more strenuously than had been the case before. When the rain did come, it was too late to affect the hay crops much, although those that are late may still be expected to pull up a little. Speaking of the crop generally, the supply of hay in the North will not be any better than it is in the South.

Royal Exhibition.

We go to press too early to give the result of the exhibition at Park Royal this week, but it is a pleasure to chronicle the fact of its having so auspicious an opening. The Royal Family has always been extremely interested in the society, and this year, as on many previous occasions, its members have shown how willing they are to aid by their presence its success. H.R.H. the Prince of Wales visited the show on Tuesday afternoon, Prince and Princess Arisugawa of Japan went down on Thursday afternoon, and the King himself honoured the show with his presence. Thus everything has been done that is possible to give the stamp of fashion to the meeting, and it only remains to be seen how far the number of visitors have responded to the implied invitation. Certainly no one is likely to deny that the show was in itself of the very highest quality, and that the arrangements made for holding it left little to be desired. The society has really made a very great exertion this year, and it is to be hoped that the return will not be disappointing. It has to be remembered that the first important patron of the Royal Society was the late Queen Victoria, who in 1851 took a very prominent part in commencing the policy of holding exhibitions. This year the society has been successful, in spite of the difficulties against which it had to struggle, in offering considerably more prizes than it did last year. There are, for example, 400 entries of horses, and the amount of prize-money to be awarded amounts to £2,091, compared with £1,471 last year. Several new classes have been added to the horses, but the prizes remain, with very few exceptions, exactly what they were before, £15, £10, and £5 for the first, second, and third respectively. There are other distinctions to be competed for which breeders prize very highly. The Shire Horse Society gives two gold medals for the best Shire stallion and the best Shire mare or filly. The Clydesdale Horse Society gives two prizes of £10 each for the champion Clydesdales, and for Suffolk Punches there is a challenge cup, valued at fifty guineas, offered by the Suffolk Horse Society. In addition to these the Hunters' Improvement Society, the Hackney Horse Society, the Shetland Pony Stud-book Society, and the Polo and Riding Pony Society give special prizes for the breeds with which they are directly connected. In the cattle section the sum of £2,947 is to be awarded in prizes this year as compared with £2,000 last year. These prizes are given in the same way as those for horses, that is to say, £15 for the first, £10 for the second, and £5 for the third. They have attracted a goodly number of competitors—Shorthorns being most numerous. There are 262 entered in this class, and 128 entries for Jerseys. In all there are ninety-four classes for cattle, and many of the societies, such as the Shorthorn Society, the Hereford Herd-book Society, the Devon Cattle-breeders' Society, the Polled Cattle Society, the English Aberdeen-Angus Cattle Association, the Galloway Cattle Society, the Royal Jersey Agricultural Society, the English Kerry and Dexter Cattle Society, and the English Jersey Cattle Society, all offer special prizes for their breeds.

In sheep there are seventy-nine classes, and the prize-money amounts to £1,647. The various breed societies again offer special prizes in this department. The pigs are awarded prizes to the extent of £492. There are twenty-two classes of them, while championship prizes are allotted by the British Berkshire Society, the National Pig-breeders' Association, and other breed societies. The total prize-money given to poultry is £319, divided among 111 classes. The breeds recognised are Old English and Indian Game, Dorking, Sussex, Brahma, Cochin, Langshan, Plymouth Rock, Wyandotte, Orpington, French, Minorca, Leghorn, Ancona, and Andalusian. Ducks include Aylesbury, Rouen, Pekin, Cayuga, Indian Runner, and any other breed or cross; while there are four classes for geese and two for turkeys.

THE GARDEN CAT.

"No house is really furnished without a shelf of books and a fireside cat," is the concluding remark in a dissertation on the "Utility of Cats." The office cat, the warehouse cat, the dockyard cat, the railway station cat, the Army and Navy Stores' cat, who takes care of the birdseed in the livestock department, the cold storage cat, a wonderful animal which, born in an icy temperature, develops special activity and qualifications for enduring extreme cold, are all of them considered; there is only one that has not received due attention—it is the garden cat.

Whether for use or ornament, there is no garden pet that can surpass a well-bred cat. In the country garden, which is pretty sure to be overrun with field-mice, if not liable to be infested with rats, there is no limit to the usefulness of pussy. It is all very well to set traps, and to bait them; no trap of man's contriving was ever so quick, so merciless, or so effective as a live one. In my own garden we find it impossible to do without two cats—one is especially for ornament, the other for use; but the *rôles* are sometimes reversed, or rather exchanged, for both are

beautiful and both of use. The beauty cat is a fine grey Persian, whose indoor deportment is so quiet and full of dignity that to see him spring out of window and suddenly develop the tiger is almost as startling as it must have been to the prince to see his white cat bride leap from his arms when she heard scratchings in the wainscoting. The feline beauty of Mr. Mouser as he stalks, paces, bounds, and springs about the walks and flower-beds, never breaking the stems and stalks, as dogs do, is delightful. Then there will be a galloping scamper across the lawn—tail flowing out behind him like a comet and his grey fur parting as the wind ruffles it to show the underlining of silky white.

Say what one will of dogs, there is no garden companion so absolutely perfect on a summer's night as a faithful cat. Of course, he will not come if you call him—that is against all cat rules; but take no notice, and there he is, one moment rubbing against your dress or feet, the next disappearing into the darkness, a little weird and ghostly as he mixes with the shadows of the shrubbery; for pussy is a complex creature, at one time the embodiment of domestic peace, at another, as full of mystery as a sphinx. But perhaps it is in the very early hours of a fine spring morning that one finds the garden cat most sympathetic; he enjoys the dawn of day and summer even more than you do. One feels quite envious of the zest with which he nibbles the young blades of grass, or with his rough, pink blotting-paper tongue licks off the diamond drops that hang upon them. Cats dote on morning dew.

All the cat tribe is inquisitive; nothing fresh you have put in the borders will escape inspection. Often to smell at it is not enough; pussy—another Eve—must taste, and if by chance you have planted a tuft of red or white valerian or cat-mint in the garden, or any of his favourite herbs, his pleasure in them is unbounded. The pretty striped ribbon-grass, common in old-fashioned gardens, is another thing he loves to browse on.

In summer-time the different lairs that pussy finds wherein to sleep away the sunny hours are chosen very cunningly. I have known him to doze for half a morning curled up, the picture of content, on the top of a tree-stump in a warm corner of the half-wild garden, or, after missing him, have come upon the great grey beauty nearly hidden in a bed of bright pink poppies, the pink and grey so prettily contrasted, no one could mind the crushing of a flower or two. Then as evening shadows fall, and the day cools, pussy rouses up to chase the white moth from the ivy, bounding after it high into the air. How full of grace each movement, and how luminous his clear inscrutable green eyes that look as if illuminated from within.

Between the beauty cat and the cowshed cat (for such is cat number two) there is an armed neutrality. Sometimes they stare at each other in rather a terrifying manner, but it is very seldom that fur flies. There is a warm corner for her in the heart of the gardener, who well knows her value, for she is not only a mouser, but a ratter, sometimes killing five or six rats in a night. These he takes the trouble to skin, so that they can be eaten, which he thinks encourages the sportswoman to kill more. It seems extraordinary that this rat-killing cat should be of the softer sex, but so it is. The cowshed is not in use, so she gets no food there. Her fame is great in all the county round, at all events, among the millers and farmers, who would much rather possess her than the beautiful Persian; and once or twice, before we knew her value, the cat was sold to one or another by the gardener (who is her real owner), but she will not stay long anywhere away from her own domain. In a day or two there she is back again, warming herself under the hay-stack near the kitchen garden, or watching for mice in the potato patch. She is never seen going after birds.

It is very inconvenient to cat-lovers to be also extremely fond of birds. But things might be worse than they are. Many birds, such as robins and thrushes, taste bitter, I am told, for which reason cats do not care to eat them. It is seldom a robin is killed; in the annals of our garden only one case is recorded in the course of many years, and that was a young robin who ran in front, like chickens do, of motor-cars. As to blackbirds, besides being very careful, they are so strong and courageous as almost to be a match for pussy. I have seen fights between a cat and blackbird in which the former came off second best, though the grass was scattered with ebon feathers.

The Utopian vision of a garden in which cats and birds would agree sometimes dazzles the imagination of the writer, who cannot help thinking her cats have some respect for the feathered favourites—at all events, before the public eye. Under a certain black poplar tree there stands a trough, where the birds drink and bathe; it is watched by Mr. Mouser, trembling and excited, but never interfered with, except sometimes when he drinks the water, which must have an agreeable flavour of bird, since one dickie or another is always in it.

The writer upon the "Utility of the Cat" has roused great uneasiness by saying that he believes in England cats are not legally protected; that is, if a neighbour chooses to run away with my Persian cat or my wonderful ratter, there is no redress. If so, let us hope the law will soon be altered. In France, a *juge de paix* of Fontainebleau decreed that the "domestic cat is not a thing of nought, but the property of its master, and as such entitled to the shelter of the law"—a sentiment in which we cordially agree; and grateful indeed are we to Mr. Chamberlain, who not long ago, in spite of some agitation in favour of the measure, refused absolutely to place a tax of any sort upon an animal who is so dear to many of us and does us such good services. Even as it is, pussy is not forgotten by the lawyers, for it is decreed, so the captain of a Royal Mail steamer once told me, that mailbags should not be carried without a cat. He would have liked my ratter.

So pussy is as useful on sea as on land, and as indispensable on board ship as in house and garden. F. A. B.

BEAR-SHOOTING IN KASHMIR.

THOSE whose lot it is to shoot tigers are inclined to look down on bear-shooting. It is true the bear is not as ready to charge as the tiger, and when he does he is not so quick or as formidable; but then one meets him on foot, whereas, in nine cases out of ten, the hunter of a tiger is either mounted on an elephant or up a tree. With experience, bear-shooting is not dangerous; but, all the same, it requires a steady hand, a quick eye, and, most of all, a cool head. Then there is the advantage of climate and scenery, for you find the bear — I am talking of the Himalayan bear, red and black—in such a splendid climate as Kashmir, a country probably the most beautiful in the world. Here the pursuit of him certainly has an advantage over tiger-shooting, for which one has to be in the jungles of the plains, and, if you want success, it must be March or April, when the heat is extreme.

I have shot many a red bear in Kashmir, in places where the views of snow mountains are superb, and in wandering about the lower ranges I have found the black bears' homes in the rocks, where the outlook from their front door was a picture that one would take a long time to tire of. There are, of course, bears in the plains also—a smaller kind, but every bit as ready for a fight if you wound them. Of these my experience has not been large; only two out of the forty-eight bears that I have shot have been killed on the plains. I said bear-shooting is not dangerous to those who have experience. This is true, and the one rule to make, if you would be free from danger, is never to fire at a bear uphill. If wounded, he will always charge you downhill; uphill, I will not say actually never, for one did try to come up at me once, but very rarely does he do so.

A PRETTY CAMP.

BOAT'S CREW.

Out of my four dozen kills I have had three charges. One bear in my early shooting days got right home, and very nearly saved the lives of about forty of her brethren. She was wounded, and started her charge at 125yds. down a grass slope, gathering impetus as she went. My left barrel did not find her, and my shikari, with my second rifle, bolted before I could get it from him. Running along the slope, out of the direct line of charge, I got two more cartridges in, just in time to get her as she rounded on me, and shot her as she rose to strike. In rising to crush one, as they mostly always do, they expose a fatal spot which makes an excellent target, namely, the white crescent on their chest; a bullet in that is a pretty sure kill.

One bear I shot I have always regretted. She was the mother of four, and had I known the extent of the family depending on her she would have been safe so far as I was concerned. She was in a cave, out of which I finally urged her with my climbing-stick; when she did come out it was in a very unruly temper, and she made straight for me, my native staff having betaken itself into the surrounding trees. When the four little cubs were produced out of the cave I regretted the killing of their mother. I have never known nor heard of another case of a bear with four cubs at a birth. Two is usual; three I have seen, but four is, I believe, unique, so they were photographed in many ways. The quartette lived with us for some time in camp, and were eventually given away in Srinagar on the condition that they were not to be sent to the plains. They each had their own ideas as regards feeding. One—a lady this was, and her name was Mary—would take her milk in no way except out of a pint champagne bottle, which she clutched and sucked till she choked. Another had a fancy for a pudding-dish, which meant a dirty waistcoat and yells of rage when he was washed afterwards. They would run after anyone they knew, just like dogs, and used to have great romps with a young dachshund, whom they bullied.

There are many places in Kashmir where the river or the lake is near enough to the haunts of the black bear to live in a house-boat, and enjoy comfort and fair shooting; but for red bear it is necessary to go further afield, right up the valleys and near to the snow-line, where the most lovely camping grounds it is possible to fancy are to be found. Black bears are generally got by beating the jungles with bands of about a hundred villagers. One shikari I had, Nadir Ali by name, once had a pack of dogs who hunted bears and leopards; but it must have been a dangerous occupation, and when he was with me only three of the pack were left. I have also shot them in the evening, when they come down to feed on the fruit trees. But best of all, I have walked them up in the high-lying jungles; but it requires a good shikari to show them to you this way, and a man whom you can trust not to bolt if there is trouble. Even the best shikari will not take a man into this sort of fun unless he knows his nerve and shooting power. Black bears do a lot of damage, and many cattle are killed by them. One monster I got near Banamula had killed no less than three cows the day before I shot him. I got quite an ovation from the villagers, and as a return for my having removed such a robber from their neighbourhood, I made them carry the body into my camp, where I spent the next day hanging him up to be photographed. He was a monster with many a scar. The crossing of rivers by rope bridges is apt to be trying

OUR BEATERS FOR BEAR-DRIVING.

SLOTH BEAR SHOT IN THE PLAINS OF INDIA.

TWO BEAR CUBS AND THEIR GERMAN FRIEND.

to the nerves. Swinging to and fro within a few feet of a raging torrent is not comfortable; still you see natives crossing with big loads. One man whom I saw had a load of grain on his head that would not weigh less than 35lb. to 40lb.

Bear-shooting in the plains requires more arrangement in every way. For comfort elephants are almost necessary, for there may be rivers to cross and a long weary way to come back to camp in the evening. In India a sportsman takes what he can get in the way of sport and is thankful—some kill tigers, some have to content themselves with snipe, and make record bags; over a hundred couple to one gun in the day is not unknown. J. A.

IN THE GARDEN.

Rhododendrons in Woodland.

THE accompanying illustration is a reminder of early summer days, when the purple Rhododendrons light up grassy ways and woodland depths with their soft and beautiful colouring. There are hundreds of different forms, and in many gardens the wild Rhododendrons of the Himalayas are grown in sheltered dells where the plants are away from winds and untouched except by the keenest frosts.

Some Beautiful Roses.

Though this is not the planting season for Roses, it is instructive to point out a few of the hybrids or varieties which are making a brave show in the garden at the present time, and these notes are the result of practical experience. If the following Roses are not in the garden of the Rose-lover they should be made note of for planting in the coming autumn.

Conrad F. Meyer has much of the Japanese Rose blood in it, and is the earliest of all hybrids to flower. It was in bloom with the writer before May was out, in spite of withering north-east winds and an absence of rain. The growth is remarkably strong, the shoots straight and vigorous, and they bear flowers of enormous size, without a suggestion, however, of unpleasant coarseness. We gathered one a few days ago, and it more than covered a small plate. The buds are firm and of a cheerful rose shade, which deepens in the centre, but as they expand and scent the air with the fragrance of the Cabbage Rose, their petals have quite a silvery sheen. It is a very prickly Rose, the stems being covered with short reddish spines, but its effect on a rough Oaken fence is very fine. A well-known rosarian recommends it for grouping in exposed positions, and it is well displayed when filling large beds on the lawn.

Gustave Regis.—This is another strong-growing Rose of the Tea-scented class, and it is very beautiful against a fence in the writer's garden. It is a leafy and very distinct Rose, but of little use for cutting, the buds clustering very close together, so that to gather one open flower means destroying a cluster of flowers in various stages of development. The half-open bud is exquisite in form and colour, the broad petals being of a warm yellow, in which there is a trace of orange —a mingling of two rich shades—and the scent is delicious. When the bud opens wide it discloses the yellow centre, and there is an end of the flower beauty to the eye of the rosarian who only seeks for mere form. The charm of Gustave Regis is in the half-bud stage.

Dr. Rouges.—We were asked a few days ago the name of a climbing Rose which, without a flower, seemed to be aglow with colour. This Rose is Dr. Rouges, a strong-growing climber with quite crimson ruddy leaves and young shoots; so much so that it is almost worth growing for this distinctive feature alone. The flowers are ruby-red, a peculiarly rich and beautiful colour, which is intensified by the crimson leaves. At a distance this variety appears as if a number of Cactus Dahlias were issuing from the foliage, the petals having that twist peculiar to the great autumn flower. The behaviour of the Rose in town gardens is at first disappointing, for two years elapse before flowers are produced in quantity; but it atones for this afterwards by blooming with the greatest freedom from June onwards.

Mme. Laurette Messimy Rose and the Lamb's Ear.—Against the house there is a border of grey-leaved shrubs and China Roses, and the happiest effect is the result of grouping the hybrid China Rose Mme. Laurette Messimy and the silvery-leaved Lamb's Ear (Stachys lanata). The Rose is so covered with flowers that scarcely a leaf is to be seen, and the colouring is a mingling of rose, yellow, delicate salmon, and orange, laid on petals which seem to flutter in the wind. Although the plants which we have in mind are exposed to every wind that blows not a shoot has been injured during the winter, and the plants have been in full flower since the middle of May. The recent heavy rainstorms have destroyed their beauty for the time, but this is a wise provision of Nature. A burden of bloom such as has been maintained for weeks could not continue through a very hot summer.

Fabvier—A group of this is as brilliant as any Geranium. This little China Rose is not so frequently planted as it deserves to be, for no variety has so intense a crimson colour, the plants being little mounds of bloom. It is planted in a groundwork of white Pansies, and the effect is excellent. The leaves of the Rose are quite a chocolate tint, and the association of this colour, crimson and white, is very pleasant to see.

Dorothy Perkins.—This is known as a wichuraiana Rose, that is, it belongs to the hybrid Japanese Rose class, which is distinguished for its extremely vigorous growth. Jersey Beauty, Auguste Barbier, Alberic Barbier, François Fouçard, Paul Transon, and wichuraiana rubra belong to the same class, and we have a beautiful addition in Lady Gay, which was shown at the recent exhibition in the Temple Gardens. Dorothy Perkins is a Rose for the pergola or arch, and it makes such rapid growth that in two years it will cover a large space with its characteristic pale green leaves. It flowers later than the majority of climbing Roses, and this is one of its great charms, as towards the end of June many of the most beautiful of the climbing varieties are out of bloom. A plant which we have in mind is now bristling with buds, and will be a picture of rosy colouring from the early days of July until quite autumn.

Billiard et Barré.—This is the most golden in colour of all the Hybrid Tea Roses its flowers quite self, and very handsome. It blooms with great freedom, and has a sweet scent, but it is the colour which makes this one of the most welcome of summer Roses. A correspondent writes of it thus: "A superb Rose, almost a pure golden yellow, is Billiard et Barré. I would recommend it as a tall bedding hybrid, believing that such Roses as this, Gustave Regis, and Germaine Trochon may be well used in this way. An effective bed could be formed by planting Billiard et Barré in the centre and Mme. Ravary round, or the former could be interspersed here and there as low pillars among a mass of the latter. Billiard et Barré surpasses all Roses

C. Cadby. *RHODODENDRONS.* Copyright

of its colour for outdoor culture. The buds are simply delightful. Nothing more beautiful has appeared for years, and it is such a good grower. It shows what influence the pollen parent can impart to the seedling, both in colour and vigour, the seed parent, Alice Furon, in this case, being a very stumpy grower, whereas Duchesse d'Auerstadt, the other parent, is of the most vigorous description, and of an intense citron yellow colour."

Sulphurea.—We have often praised this Rose, but it is still unknown to many gardeners, although exactly the sort for the beginner to whom failure is vexatious. Sulphurea is a Tea variety, with deep bronzy foliage and a profusion of sulphur-coloured flowers of sweet fragrance and dainty form. A few plants are weighed down with the charming clusters, and the beds we have filled with this variety alone will give beauty to the garden until quite late in autumn. It is not unusual for many Roses to flower quite six months of the year.

Hybrid Briar Rose Una.—This Rose has been planted in the Royal Gardens, Kew, to fill a large bed, one with a circumference of 70ft., containing only fifteen plants, thus showing the great vigour of the growth. The buds are of a tawny yellow colour, and open out wide to the sun, showing the full charm of the creamy white petals. They appear all along the growths in clusters of from three to six, and form as dainty a picture as it is possible to produce with any Rose, not even excepting the latest wichuraiana race. The growth is very robust, suggesting the Briar origin of the Rose. It would make an ideal plant for covering a loamy bank, where it could ramble in its own way.

RANDOM NOTES.

A Note on Sweet Peas.—This favourite annual has greatly benefited by the rains of June, and the growth, though very late in flowering—too much so for some of the early exhibitions—is very strong. We shall not be surprised if the Sweet Pea season continues far into the autumn, though a long spell of hot and drying weather has the effect of quickly stopping a succession of bloom. Much, however, may be accomplished by mulching, giving water to the roots, and overhead syringing in the evening, but more by preventing the formation of seed-pods. Unless the flowers are picked off directly they have faded a prolonged display of flowers cannot be expected. The plant cannot bear a double burden.

The Tufted Pansies.—A very interesting lecture was given a few days ago at the Horticultural Club by Mr. Crane on the subject of "Tufted Pansies," of which the lecturer has made a special study, and considerably improved by raising new varieties. Few groups of hardy plants have undergone so great an improvement during recent years as the Pansy, and this improvement continues. The plants are very compact in growth, and in some instances the shoots seem to creep along the ground, making a mat of leaves, above which appear in delightful profusion the clear-coloured flowers. There are no muddy shades in the best of the newer varieties, and they are practically perennial in this respect, a bank of the newest varieties in the garden of the writer having been bright with colour since last Christmas. Such varieties as Devonshire Cream, Cream King, Ethereal, Miriam Waters, and Blue Tit are flowers for all gardens.

The Hornbeam.—In the June number of the beautiful monthly magazine *Flora and Sylva* there is an excellent description of one of the most interesting of British trees, the Hornbeam (Carpinus Betulus), illustrated by a well-reproduced drawing of pollarded trees by H. G. Moon. The writer aptly describes the tree as "one of the neglected children of the woods," and regrets its neglect by planters in this country. It is mentioned that "perhaps one reason is the misusage it has undergone at the hands of continental gardeners, who have trimmed and cut it into all kinds of absurd shapes. We first saw it in a very leprous state at Versailles, and also in some Austrian gardens, where the only trees admitted were those that, owing to their texture and close foliage, could be clipped into walls. . . . The Hornbeam is a native of the southern parts of England, but not of Ireland or the North, and it inhabits a vast region in Central and Northern Europe and Asia. It is more limited in its northern area than the Beech, though it reaches as far north as Denmark, and it is also found in the Crimea, the Caucasus, Persia, and Asia Minor, though not in Africa or the warmer parts of Southern Europe. It is said in books to like a clay soil; but, from our own experience, and judging also by its rarity in the heavy wealden country south of London, it does not seem to like a compact soil, while it is abundant at Epping, in more open soil. Some coolness of soil is, no doubt, necessary to it. Free, sandy loams suit it better than the compact soils of the Weald, nor does it care for very hot ground, any more than for marsh lands or those of a turfy nature. A tree of the plains and low hills, it never rises much above 1,500ft. in the North of Europe, and only to about 3,000ft. in the extreme south of its area. The Hornbeam is not a long-lived tree, rarely lasting more than 100 years, while its limit appears to be about 150 years. The finest trees seldom exceed 70ft. in height."

DYNAMITING SEA-FISH.

A CONTRIBUTOR to a Cornish contemporary seriously suggests that the regulations prohibiting the use of explosives within territorial limits should be amended so as to allow of summary dealings with the dog-fish plague; but it is devoutly to be hoped that no such removal of existing restrictions may be contemplated by the authorities. Grave as is the grievance of the dog-fish plague to our Cornish fishermen, the situation created by any general acquiescence in irresponsible dynamiting would be appalling. Mr. Joseph Rich, the writer in question, proposes to enclose the dog-fish in a seine, or to catch them in the drift-nets, and then to throw bombs among them; and were it possible to confine the explosive treatment within these limits, some scheme might possibly be devised whereby accredited dynamitards might undertake the work of destruction. To allow the indiscriminate use of explosives by every fisherman and loafer, however, along our south-west coast would be to encourage the further ruination of the inshore grounds, for it would be absolutely impossible to provide against improper use of the fuses.

As an instance of the dreadful destruction that can be wrought by this means, a correspondent of the writer's, a Mr. Ben Read of Reforne, Dorset, cheerfully admits, with some pride, that on one occasion he murdered over 600 beautiful bass, some of them 30in. in length (this, if the fish were in anything like condition, means a weight of 12lb.), at a shot, while on less successful occasions he bagged by the same nefarious means over 100, and his victims included conger, bream, and whiting. It is probable that members of the British Sea Anglers' Society would joyously see this person blown up with one of his own bombs, so that the fishes might feed on his disintegrated being, and it is certain that such individuals, now fortunately prohibited from such nefarious doings by law, are responsible for much of the ruin of our inshore fishing grounds in the past.

Mr. Rich argues from eccentric premiss to fallacious conclusion. He finds no more absurdity in blowing up fish than in shooting birds, and the wholesale destruction of the dynamite bomb is to him as reasonable as the sweeping work of the punt-gun. Fortunately, on sporting grounds or otherwise, such baneful blasting of our sea-fish is prohibited within the three-mile limit. The Board of Agriculture and Fisheries knows of no similar restriction further from land; but it is to be hoped, if there is any recrudescence of this enthusiasm for dynamite, that international action may be taken to enforce like prohibition on the high seas. On all counts, from the fisherman's point of view particularly, but also out of regard for the security of human life at sea, it is desirable to exclude dynamiting from the recognised methods of killing fish, whether these be vermin or marketable food.

F. G. AFLALO.

AN OLD ENGLISH SYMBOLIST.

IF some curious observer were to step from the England of the Middle Ages into the England of to-day, and were asked for his impressions, would he not name, among the first, an immense carelessness as to the outward setting of life—a dull prevailing monotony of external form, colour, action? And how would he not contrast this apparent sameness with the outward fashion of the daily life of his own century, a life full of obvious significances. So, if any among us, a little tired perhaps with the constant sight of mean and empty forms, would care to see with the eyes of an earlier time, let him turn to a small brown volume, much used, and with many an old owner's name inscribed, now lying before me; a volume occupied wholly with the clothing of things invisible in quaint tangible garments of appropriate symbol, symbols devised to bring vividly before the eye just those "things that matter," which we in modern England so successfully smother out of daily sight.

In 1669 there was to be sold "at the Crowne and at the Marigold in St. Paules Churchyard" "Emblemes" by Fra. Quarles. The fine old frontispiece shows us, immediately, certain divine and mundane emblems, supported by two sturdy angels, and

SYMBOLIC BILLIARDS.

dominating a walled city set on an estuary busy with shipping. Next follows the dedication, which betrays the hand of the courtier no less than that of poet and moralist; for Quarles was at one time cup-bearer to Elizabeth, the unhappy Queen of Bohemia, and, in our own Civil Wars, was ever a loyal cavalier. These are the words with which he lays his book before "My much Honoured, and no less truely beloved Friend, Edw. Benlowes, Esquire": "You have put the Theorboe into my hand, and I have played: You gave the Musician the first encouragement; the Musick returneth to you for Patronage. Had it been a light

"A NEW-FOUND VANITY."

Aire, no doubt but it had taken the most, and among them the worst; but being a Grave Strain, my hopes are, that it will please the best, and among them you. Toyish Aires please trivial Ears; they kiss the Fancy, and betray it. They cry, Hail, first; and after, Crucifie: Let Dorrs delight to immerd themselves in dung, whilst Eagles scorn so poor a Game as Flies. Sir, you have Art and Candour; let the one judge, let the other excuse your most affectionate Friend Fra. Quarles."

Following the fancy of this dedication is the first of the hundred or so of following "Emblems," or symbolic pictures, each accompanied by Quarles' own verses and epigrams, by quotations from the Fathers, and by a Latin or English text. This, the first Emblem, shows the Soul, yet at ease, and the large lute, or theorboe lying beside the somnolent figure; but light streams from a circle overhead, and the sleeper awakens. The accompanying verses are called "The Invocation":

> "Rouze thee, my Soul, and drein thee from the dregs
> Of vulger thoughts: Scrue up the heightened pegs
> Of thy sublime Theorboe four notes higher,
> And higher yet, that so, the shril-mouth'd Quire
> Of swift-wing'd Seraphims may come and join, . . ."

The "Emblemes" proceed to paint the Soul's vicissitudes on the "fond earth," as typified in the then daily happenings, or the rarer incidents, of life. So in Emblem III. of Book IV. we find the soul learning to walk in the "straight path," by aid of a seventeenth century go-cart, a path for which, the verses tell us, she has little liking in comparison with following lucre, pleasure, worldly honour; the stanza concerning the latter betrays the poet who had seen the charm of Courts:

> "If blazing honour chance to fill my veins
> With flat'ring warmth, and flash of Courtly fire,
> My soul can take a pleasure in her pains:
> My lofty strutting steps disdain to tire."

Whereas for the narrow path "my way is tedious and my steps are slow." Nevertheless, the final Epigram bids for courage:

> "Fear not, my Soul, to lose for want of cunning;
> Weep not; Heav'n is not alwaies got by running:
> Thy thoughts are swift, although thy legs be slow;
> True love will creep, not having strength to go."

In yet quainter form the "narrow way" appears in Emblem IX., symbolised by a billiard-table of the period, on which the Soul is learning that the true

> "way is hard and strait,
> And leads me through a thorny gate;
> Whose ranckling pricks are sharp and fell;
> The common way to Heav'n 's by hell."

After quotations from St. Jerome and St. Gregory concerning the hard labour and the "valour of the just man" in overcoming the adversities and wiles of this present life, follows Quarles' own Epigram:

> "O, *Cupid*, if thy smoother way were right,
> I should mistrust this Crown were counterfeit:
> The way's not easie where the Prize is great:
> I hope no virtues, where I smell no sweat."

Incidentally we may note that this seventeenth century billiard-table is made on the English, not the French, pattern; and perhaps some archæologist will determine whether the narrow gate through which the pupil-soul is being taught to aim his ball of life is a hoop belonging to the game as then played, or but the added fancy of the symbolist.

In the opening of Book II. we find pictured the foolish Soul, busy in the "broad way," and fain to walk there in the light of her own "self-consuming flames," and to "puff out

BLOWING "HEAVEN'S TAPER OUT."

Heav'n's glory." The folly of this Soul is emphasised by the fool's cap worn by the figure that is essaying to blow out the "light of Grace"; the while another image of the earthly Soul snuffs and trims the weak and idle rays of his own feeble candle. For such "rebellious fools" Quarles has little mercy:

> "Deluded mortals, tell me when
> Your daring breath has blown
> Heav'n's Taper out, and you have spent your own,
> What fire shall warm ye then?
> Ah, fools, perpetual night
> Shall haunt your souls. . . ."

In further warning against the folly of vain pride is placed a text from Isaiah: "You that walk in the light of your own fire, and in the sparks that ye have kindled, ye shall lie down in sorrow"; and there is added from St. Augustine one of those balanced antitheses beloved by the age of Quarles, the age of Conceits and Epigrams: "The sufficiency of my merit is to know that my merit is not sufficient."

From these exhortations concerning the conduct of active life we come, in Book IV., to a pastoral in praise of country seclusion:

"Come, come, my dear, and let us both retire
And whiff the dainties of the fragrant fields:
Where warbling Philomel, and the shrill-mouth'd quire
Chaunt forth their raptures; . . .
. . . where the new-born brier
Breathes forth the sweetness that her *April* yields.
Come, come, my lovely fair, and let us trie
These rural delicates; . . ."

The Soul hesitates whether to leave the activities of her "City mansion," whether

"'I'll stir with Martha, or I'll stay with Mary.'"

Thereon she receives further instruction as to the joys of the rural abode, and is all eagerness to go thither, receiving the assurance that there her head shall be crowned with all graces. The patristic motto chosen for this Emblem is from St. Bernard: "O blessed Contemplation! The death of vices, and the life of virtues! . . . Who ever attained perfection, if not by thee! O blessed Solitude, the Magazine of Celestial Treasure! by thee things earthly, and transitory, are changed into Heavenly, and

THE DEVIL'S BOWLING GREEN.

Eternal." Then follows Quarles' own application of the matter in his Epigram, from which it appears that in his eyes the life of cities savoured but little of "blessed Contemplation":

"Mechanick soul, thou must not only do
With *Martha*; but, with *Mary*, ponder too:
Happy's that house where these fair sisters vary;
But most, when *Martha's* reconcil'd to *Mary*."

In the woodcut the Celestial figure seems to be led, rather than to lead the Soul (well clad for country wear) out into the solitude of field and wood; an apparent inversion of the written word for which the artist presumably is responsible.

In an Emblem in Book III. we have the poet in sterner vein. Here is man being fashioned out of his native clay:

"The same the stuff, the self-same hand doth trim
The Plant that fades, the beast that dies, and him."

Further, the plants and the beasts are man's elder brethren by right of primogeniture; the plants are "with fairer robes arrai'd," the beast "in sense exceeds him":

"Why look'st thou then so big, thou little span
Of earth? What art thou more in being man?"

In response man claims his higher nature, and is told that,

THE TITLE-PAGE OF "EMBLEMES."

therefore, the greater are his iniquities, since "good declin'd turns bad, turns worst of all." At last the Soul thus takes refuge from the arguement:

"Eternal Potter, whose blest hands did lay
My course foundation from a sod of clay,
Thou know'st my slender vessel's apt to leak;
Thou know'st my brittle temper's prone to break;
Are my bones brazil, or my flesh of oak!
O, mend what thou hast made, what I have broke."

Does not the English symbolist here recall the imagery of the Persian Omar, who, standing alone in the Potter's shop, found that amid the wares "some could articulate," and for all after ages has recorded the voice of the questioning clay:

"Then said another, 'Surely not in vain
My substance from the common Earth was ta'en,
That He who subtly wrought me into Shape
Should stamp me back to common Earth again.'"

In the figure, the Potter, as usual distinguished by the nimbus, seems to be working the great spokes of the wheel with his foot. The seated Soul should doubtless be conceived of as waiting disembodied, with hand outstretched, to receive her outward form, that "proud pinch of living Earth." I am at a loss to understand the meaning of the breath blown into the left hand.

The vanity of this world, and the pleasures thereof, are a constant theme of the Emblems. Quarles' own life must have shown him many a hard vicissitude, whether in his early service to the Bohemian Queen, a Queen of but a few months and dethroned for a lifetime; in his post as secretary to Archbishop Usher, a prelate who underwent many wanderings in the troublous times of the Civil Wars; or in his own personal

sufferings at the hands of the Parliamentarians, who so harassed this poet and scholar, injuring his property and plundering him of his books and rare manuscripts, that his death is attributed to their persecution. It is difficult to conceive a more stupid and brutal fanaticism than that displayed by the Puritan party in their rage against the pious poet and quaint visionary, Francis Quarles.

Quarles truly had reason to say, with one of those Early Fathers he so often cites: "The pomp of the world and the favour of the people are but smoke, and a blast suddenly vanishing"; and one of the quaintest of his Emblems is given on this text. On the globe of the world, and chained thereto, sits the worldly soul, occupied in holding a consuming torch and in smoking a fine churchwarden pipe. The angelic monitor beside him carries a birdcage, with a bird therein, doubtless as a figure of the Soul caged in earthly desires. In the accompanying verse it would almost seem that the poet shared the views of his late King, James I., on tobacco, occupied though he chiefly is with the image of smoke as representing the passing ambitions of this world:

". . . behold
A new found vanity, which daies of old
Ne'er knew: a vanity that has beset
The world, and made more slaves than *Mahomet*,
That has condemn'd us to the servile yoke
Of slavery and made us slaves to smoke."

A SEVENTEENTH CENTURY GO-CART.

There is humour in the last of the Emblems which we here reproduce—the bowling green. Here Mammon and "Cupid" are playing bowls:

"Close by the jack, behold, gill fortune stands
To wave the game, . . .
The world's the jack; the gamesters that contend
Are *Cupid*, *Mammon*: that judicious Friend,
That gives the ground, is *Satan*: and the bowls
Are sinful Thoughts; the Prize, a crown for Fools."

Who, adds the poet, breathes that bowls not? Who hath not here "plaid his rubbers"? The poem is written with a lighter fancy than many of the verses, and is full of the phraseology and manners of the bowling green. The ball marked with a symbolic cross is doubtless the "jack," or ball which, then as now, served as the mark for the players to aim at. And "gill fortune," who stands, as the verses say, "to wave the game," displays for prize to the successful gamester a fool's capsimilar to that in the Emblem inscribed "sic lumine lumen ademptum,' where, as we have seen, it is worn by the soul, who, steeped in his own folly, would fain extinguish Heaven's light with a pair of bellows. To the lover of the little things of past centuries it may sometimes seem that such details bring old days more vividly before us than do the statelier official relics of antiquity. For such there will be a special charm in these "Emblems."

THE POTTER AT WORK.

An appended passage concerning the latter end of sin, from St. Jerome, does not lack in force, and in Quarles' hands even this quaint conceit is not without its dignity:

"Good God! turn thou my Brazil thoughts anew;
New sole my bowls, and make their bias true:
I'll cease to game, till fairer ground be given.
Nor wish to win, until the mark be Heaven."

The thought of the symbolist is alien to much of our modern life. It is something of an effort to bring our minds into focus with the seventeenth century visionary, and to see beyond the first impression given by his old woodcuts of quaintness bordering sometimes on the grotesque, sometimes, as in the Emblems inscribed "My Soule hath desired thee in the Night" and "Lighten mine eyes oh Lord lest I sleep the sleep of death," achieving an imaginative force not unworthy of William Blake. In his gift of touching common matter to finer issues, of finding "figures" of things unseen in the ordinary surroundings of life, Quarles does but follow in the steps of the great Idealist.

The Platonic theory of Ideas, those archetypes of the objects of the world of sense, is expounded in words bearing as simple and concrete a meaning as do any of these Emblems of go-cart, pipe, candle, bowls, placed before our eyes by the English symbolist. "*An Emblème*," he writes in his address to the Reader, "is but a silent Parable. . . . before the knowledge of Letters God was known by *Hieroglyphicks*. And, indeed, what are the Heavens, the Earth, nay, every Creature, but *Hieroglyphicks* and *Emblemes* of his Glory?"

"COME, COME, MY LOVELY FAIR, AND LET US TRIE THESE RURAL DELICATES."

In such words as these, and in the entire design of his "Divine Emblemes," Francis Quarles, perhaps, realised his great contemporary Herbert's thought of the unique position of man as intermediary between two worlds:

"To this life things of sense
Make their pretence;
In th' other Angels have a right by birth:
Man ties them both alone,
And makes them one,
With th' one hand touching heav'n, with th' other earth."

G. M. GODDEN.

EARLSHALL, FIFESHIRE,

THE SEAT OF MR. R. W. MACKENZIE.

THE castle of Earlshall, now the seat of Mr. R. W. R. Mackenzie, is a true picture of Scottish history for the time when the Middle Ages were grudgingly making way for the beginnings of modern life. Sir William Bruce of Earlshall was building the old work in 1540. Two years before this, King James, fifth of the name, rode out from the Abbey port of St. Andrews, yonder across the bay, to meet Mary of the Guises, his bride from France, and the lull of something like peace which had taken the country after Flodden was soon to be at an end. At Flodden had fallen, sword in hand round their King, a host of those barons of whom it may at least be said that they were the scourge and curse of the land. But at the building of Earlshall a new generation of these stubborn men had grown up, and for a score of causes swords were loosened in the scabbard. Religion itself was preparing the people for blows and blood; for the King's marriage had cast in his lot with France and the bishops against an English alliance and a reformed Kirk.

The tower of Earlshall had stood but two years when the wanton adventures of the King of the Commons were over. In 1542 James died in his palace of Falkland, and peace and the building of houses were at an end in Scotland for half a century. A girl child was on the throne, the Reformation was beginning with fire and sword, and St. Andrews was in the midst of the making of history.

The baron of Earlshall might take comfort to himself that he had built in a good hour, as he looked over his new walls at the turmoil. In St. Andrews George Wishart was strangled and burned before the castle by the Cardinal Beaton, a Scotsman bred in France, who lay upon his cushioned seat to watch the spectacle. But Wishart and his like had friends who wore steel. Within two months, David Beaton, who had in the meantime made a great marriage for his daughter with the Master of Crawford, was called from his bed in St. Andrews Castle by the avengers, Norman Leslie and Kirkaldy of Grange, and, standing in his bedroom, died by the sword of James Melville. Over the castle wall, whence he had looked upon Wishart's death, the naked body of the Cardinal Archbishop was hung by a leg and an arm, and St. Andrews and all Scotland were aware that the new heresy was prepared to give blow for blow.

What part the house of Earlshall played amongst these doings we know not, but Earlshall bears no marks of war. It was a castle of the new fashion, built when the Scottish barons had learned that the great keep of the Middle Ages, with its wide

courtyard ringed about with walls and towers, was no longer needful. The King or the Douglas might build such and hold them, but lesser men had learned that they could raise no fortress which could keep out a besieging army with its battering guns. A strong house was still needful, whose stout walls might hold out against angry neighbours, a St. Andrews

Copyright *THE OLD ENTRY.* "C.L."

mob, or light-riding forayers from far. But the memories of Earlshall are rather of sport than of war. The banks of Eden were beloved by falconers, and the heron still builds her nest in the Earlshall woods. Queen Mary rode from St. Andrews to hunt in Earlshall, and James VI. and I. galloped over the lands in his padded saddle.

The plan of the old castle of Earlshall has the L form common amongst Scottish castles of its time, the top of the L pointing eastward. Such a building represents the old square keep with an angle thrown out. Three rooms lay along the upright of the L, the easternmost joining a round tower at the north-eastern corner. The foot of the L was a kitchen, until another was built out across the yard, and an entry which an enemy would approach under fire from the two walls of the angle. Here in the crook of the L was the round stairway from the ground floor to the garrets. Entering at this ground floor, we can recall a picture of the simple lives of these Scottish barons. To a race that would liever hear the lark sing than the mouse squeak, the home was a stronghold, a shelter for the night, a larder—anything but a place where the affairs of life were lived out. The ground floor of Earlshall must have been a gloomy place, with its narrow windows pierced with deep splays in the mass of the wall, and we cannot believe that much plenishing of furniture ever decked these chambers. By the stairway tower the first floor is reached. Here is a large hall

Copyright *DOORWAYS IN AN ANGLE.* "C.L."

room whose west end was crossed by a screen. At the east a smaller room leading to a round room in the east tower, a room which may have been a bedroom. Another small chamber is above the kitchen. The hall screen has been restored in sound woodwork with graceful carving. The open hearth and great fireplace gives us one of our best illustrations. Over the fireplace are the shield, helm, crest, and supporters of the barons of Earlshall. The shield bears the arms of Bruce and Leslie. This, with the letters A : B and E : L, tells us that the work of this room was finished by Alexander Bruce of Earlshall and Euphame Leslie his wife, a daughter of John Leslie of Parkhill, a cadet of the Rothes family. She and her husband had a charter in 1581. He was grandson of Sir William Bruce who first began the building of Earlshall.

Another ascent of the staircase brings us to a room which speaks of the peace and easement of life which followed the union of the old enemies, the two kingdoms. The Scottish baron has now leisure and taste to demand more than shelter and safe keeping in his house, and the great gallery of the second floor, 50ft. in length, is decorated in a manner which makes Earlshall remarkable among Northern houses.

The wall has a tall frieze, with a painted arcade of pilasters with flat arches. The flat roof, rounded to the sides, is covered with a painted decoration, a multitude of panels, square and round, and filled with curious pictures. The virtues are here: FORTITVDO, IVSTITIA, and their companions. Other round

panels bear the arms of the Scottish earls and nobles. Above the fireplace we have the gyrons and galleys of THE ERL OF ARGYLL, whose word is I BYDE MY TYM, the Douglas heart of THE ERL OF ANGVS, and the chequered fesse of THE ERL OF ATHOLE. Above these are square panels of strange and marvellous beasts, the MOVSE OF ARABIA, the SHOE LION and the MVSK KET. In the frieze are many wise sayings for the admonishing of the lords and ladies of Earlshall. From them we learn that

A . NICE . WYF . AND
A . BACK . DOORE
OFT . MAKETH . A . RICH
MAN . POORE.

A "nice" wife is, of course, an over-dainty one, and the sentiment, in other words, is still, doubtless, a stock advice of home companions and household manuals. By the corner of the chimney-piece we have

GIVE . LIBERALYE
TO . NEIDFVL . FOLKE
DENYE . NANE . OF
THEM . AL . FOR . LITLE
THOV . KNAVEST . HE
IRIN . THIS . LYF . QVHA

BEFALL.

Which would persuade us that the old Scottish charity of a handful of meal at the door was not neglected at Earlshall.

Copyright THE STAIRCASE. "C.L."

All this painted work, once falling into abject decay, has been carefully restored by the present laird of Earlshall. The story of its restoration by Mr. Mackenzie, who bought half-ruined Earlshall in 1891, is deeply interesting to those who know at what pains a beautiful and curious thing has been saved for Scotland. The painting was all on timber, which the rain through the roof had made too rotten for a nail to stay in, and much had already fallen. Piece by piece the surface was sliced away, and glued like veneer to sound wood, which could then be secured as in former time to the upper couples of the roof. This achieved, the painting, still clearly to be seen, was slowly brought back to its original colours with distemper.

One of our pictures shows the fireplace of the painted gallery, and here again we have a date for the enrichment of the second floor of the Castle. Here is, again, a shield with the arms of Sir William Bruce, the founder, and those of Margaret Meldrum, his wife, a daughter of Meldrum of Seggie, with the letters W : B and M : M, set up here by William Bruce of Earlshall, the founder's great-grandson, as is recited in the inscription, to commemorate his own work, and his ancestors'. The inscription runs thus:

ÆDES . HAS . EXTRVE
BAT . D . W . B . AN . 1540
EXTRVXIT . TANDEM
W . B . EIVS . PRONEPOS
ANNO . 1617.

The letters D.W.B. stand for Sir William Bruce (Dominus Willelmus Bruce). By the fireplace in our picture are seen the

stone steps of the newel staircase leading upward to the roof and garrets. The ceiling has the date of 1620, with the initials of W : B and D : A : L, for William Bruce and the Dame Agnes Lindsay, his second wife. She died in 1635, aged sixty-eight, having taken a great share in the finishing of the work about the house.

From the L-shaped building a curtain wall, having an arched entry and a parapet with a walk along the top, was built to carry the foot of the L towards the square tower of a second and smaller building which, running parallel with the main building, was joined to it by a second wall, whose place is now taken by a stone balustrade. Thus a courtyard was enclosed, and the plan of the house began to approach that of the ancient castles. In this courtyard is the castle well, whose graceful ironwork is seen in our picture. The parapet of the west wall, with its corbel work, is now heavily overgrown with creepers, but our readers will note the bartizan which hangs over the doorway, whose assailants it would command.

In the midst of the smaller building is the newer kitchen, now brought back to the appearance of an old Scottish kitchen, with its broad hearth and open fireplace covered with a wide and low arch. Against the wall is the long "bink" on which the company in the kitchen ranged itself, and more than one seat can be set by the fire upon the hearthstones.

Over the square-headed and narrow entry to the main building we still see the shield of Sir William Bruce the founder and his helm with its crest of a bridled nag's head, a crest most absurdly misinterpreted in MacGibbon's drawings of ancient Scottish castles as a large figure of 4. But in very many gables and walls the arms of Bruce give place to the initials which mark for the future student of architecture the careful restoration and rebuilding with which Mr. Mackenzie has preserved to Fifeshire one of its most interesting historical buildings, a castle which, before his coming, was hurrying to decay. It now stands sound against the weather, a grave but most picturesque house, with its corbel work, high-pitched roofs, tall chimneys, and "craw-step" gables.

The Bruces of Earlshall who dwelt here in the old time were some of the chief cadets of that illustrious house which gave Scotland a dynasty of kings. Sir Robert Bruce, the baron of Clackmannan in the fourteenth century, besides an elder son from whom the houses of Elgin and Kincardine would claim descent, had a second son Edward, husband to the heiress of Airth of Airth. Here, again, a second son branched out, one William Bruce, whose life and death in the service of France are said by a doubtful legend to be commemorated by the fleur-de-lys in his descendants' stone shields at Earlshall. His son Alexander, also a soldier in France, was a favourite squire of James III., and after gaining many other lands, had a charter of Earlshall barony in 1496. His son Sir William was the castle founder, whose great-grandson William ended the work.

Best remembered of all the barons of Earlshall was Bruce of Earlshall, who persecuted the Whig saints. On a July day in 1680, Richard Cameron, from whom derived the Cameronian sectaries, was lying at the edge of Avis Moss, between Cumnock and Muirkirk, with three score of Whigs. Earlshall and his dragoons charged and scattered them, most of them flying into the moss; but Richard Cameron, praying that God might take the ripe ears and spare the green, was cut down, with eight others, and Earlshall's name was accursed in every preaching amongst the moss hags.

The main line of the family did not long survive the days of the persecutor, but Alexander Bruce, a younger son of the Earlshall who made the painted room, left descendants. His great-great-grandson John Bruce of Grangehill, a philosopher and historian who studied the Elizabethan defences of the kingdom for the benefit of Mr. Pitt when Bonaparte was at Boulogne, was the heir-male of the old house of Earlshall.

INSECT PESTS.

AMONG the work undertaken by the University of Birmingham is an attempt to deal in a definite and scientific manner with the various injurious insects and other animals that are found in the West Midlands. Correspondents are invited to forward to Professor Collings any injurious insects in any stages that may be observed. Reports are made on these, and suggestions as to how best to deal with the cases. The area dealt with consists of seven counties, Hereford, Salop, Worcester,

Warwick, Stafford, Leicester, and Northampton. That the work is appreciated is seen from the fact that 325 enquiries were made in 1904 on 93 different species. Some were found not to be injurious, or, if injurious, only so in a very slight degree, and these are not dealt with in the report. One of the most striking features in the report is the way in which some insect pests increase in certain localities, while in other districts there is no such increase; for instance, wireworm has largely increased in Shropshire, the winter moth and plum bush beetle are on the increase in Herefordshire, the apple blossom weevil in Worcestershire. There must be some reason for this local increase, and if it could only be ascertained, a large step would have been made towards dealing with it. Take, for instance, the winter moth. It had not appeared in any great numbers in the Evesham district since 1888, when there was a plague of this insect, and great damage was done. Since then spraying with Paris green and the systematic use of grease bands on the trees have been largely used, and, it was said, with success, so that the plague was kept under; but at the end of March last year the larvæ appeared in large numbers, and in spite of Paris green and grease bands are largely on the increase. If it could only be ascertained, there must be some cause that has led to this increase. To take another example. In 1903 Professor Collings was able to say that the caterpillars of the Magpie moth were not particularly injurious, but in 1904 there was a very large increase. A correspondent at Stafford stated that from one small gooseberry bush he had picked off and killed over 2,000 larvæ. Other cases might be mentioned, such as the unusual prevalence of the larvæ of the cabbage moth. It is said that if remedial measures are not taken by growers the damage from some of these insects is likely to be very serious during this year. Here, it seems to us, is the weak spot in our arrangements—we leave everything to voluntary effort. There is no legal means to see that any measures are taken at all, or, if any measures are taken, that they are effectually taken. It is just as easy to stamp out these insect pests as it is to stamp out any of the contagious diseases that affect animals. Both are injurious to the nation, as both affect the nation's supply of food. We hold that, when once any plague of injurious insects is detected in a district, it should be the duty of some authority to take steps to stamp it out. Everything is now put upon county councils. They might usefully add this to their other duties. The report brings out some rather important points on another side of the question. At present any man can use whatever form of manure he likes, quite irrespective as to whether its use does injury to the land. For instance, a landlord has to pay an outgoing tenant for the unexhausted value of purchased feeding-stuffs. A tenant who is leaving, and who desires to do his landlord a bad turn, consumes on the land large quantities of rape cake; the landlord has to pay for the unexhausted value of the cake. If there is anything in economic biology, the unfortunate landlord is made to pay for an injury, not for a benefit, to the land. If there are any wireworms about, the use of rape cake attracts them; the larvæ feed on it. A case from Shropshire is cited, in which it is said "that in some fields they were never more numerous, there must be millions." On these rape cake had been largely used as a feeding-stuff. If this is correct, surely there should be some means of preventing the robbing of landlords by the use of feeding-stuffs that do real injury to the land. Yet, at present, any such idea as that the tenant should be limited in his selection of cake would be scouted as the worst kind of tyranny. At present, all legislation has been in favour of the tenant. As economic biology proceeds, it may be found that the use of a particular feeding-stuff, or of certain manures, is the cause of the outbreak of certain plagues of insects. The slovenly habits of the British occupier are also, it appears, responsible for the spread of insect pests. A comparatively modern one, the cabbage field weevil, has been allowed to get a firm hold in South Worcestershire and Warwickshire through the lazy and slovenly methods of the occupiers of the land. If the infected cabbage-stalks were pulled up and burnt there would be some hope of stamping out the pest; but the treatment is thoroughly British. To get rid of the insect the cabbage-stalks are pulled up, thrown into a heap, and left to rot; it is too much trouble to burn them, so the insects have a good time in the stalks, and are fruitful and multiply, and although they may possibly not replenish the earth, they certainly subdue it.

Copyright. *EARLSHALL: IN THE PAINTED GALLERY.* "C.L."

Another instance of the casual ways of our fruit-growers may be seen in the history of the codlin moth. Years ago it was introduced into this country from South-Eastern Europe, and has spread all over the world. In Tasmania the loss from it varies from 25 per cent. to 75 per cent.; and still, in some of the American States, in spite of preventive measures, the loss is 50 per cent. Yet the American experiments prove that the insect can be successfully kept under if dealt with systematically. Our general apathy on the subject allows this insect to get a steady hold on our fruit trees. Some day we shall get an outbreak like the American or Australian, and then perhaps we may do something.

Yet another pest that is annually increasing, and increasing from our apathy, is the pear midge. Thirty years ago its appearance had not been recorded in this country. Now it is so numerous in some places that the whole pear crop is lost. In a Herefordshire orchard it appeared ten years ago; now it is said to be useless to try to grow pears there. Yet there is no doubt that, if drastic and systematic measures were taken, the midge could be stamped out; but it is no one's business, and so nothing

is done. As we have already said, the report points strongly to the necessity of some measure being taken, and taken at once, to stop the spread of preventable pests. Economic biology at last shows us that if we sit with our hands folded, doing nothing, our crops will be ruined. The foreigner not only fills our markets with the fruit he sends over, but he sends us with the fruit some of the insects that destroy ours, and so give him a monopoly; yet nothing is done to prevent this. Cannot the Board of Agriculture and Fisheries get Parliament to pass some measure, even if it is only permissive, that will enable those who desire to promote fruit culture and agriculture to preserve their crops from preventable pests?

THE ASCOT WEEK.

THAT the Royal Ascot Meeting of 1905 has been a brilliant success as a social function is not to be doubted; and the splendour of the scene on the Cup day, when the Royal procession, headed by the open carriage in which were seated Their Majesties the King and Queen, accompanied by H.R.H. the Prince of Wales and Princess Victoria, came up the green track of the race-course, to the accompaniment of hearty cheering from the crowds along the rails, will not readily be forgotten by those who witnessed it. A striking feature of the meeting was the success of horses bred and owned by Mr. W. Hall-Walker, and trained by Robinson at Foxhill. Mr. Hall-Walker's stud of horses in training is a small one, but he is a profound student of breeding from a scientific point of view, and has applied his knowledge with such effect that he has won the Ascot Stakes, the Coventry Stakes, the St. James's Palace Stakes, the New Stakes, and the Windsor Castle Stakes, amounting to a value of nearly 9,000 sovs., by the aid of Cherry Lass, Black Arrow, Sandboy, Colonia, and Golden Table. It is of interest to note that the first two are out of Black Cherry, the next two out of Sand Blast, and that Count Schomberg is the sire of Black Arrow and Golden Table. With the exception of Cherry Lass, none of the three year olds seen out at Ascot is of much account, and of the four year olds Delaunay, Henry the First, Santry, and Andover were the pick of the basket, though Commune, the winner of the Coronation Stakes, has come on a good deal since running in the Oaks, and may eventually develop into a mare of some class. Amongst the two year olds, Black Arrow stands by himself; and, in regard to the older horses, Zinfandel is a good horse, and his brilliant performance in the Gold Cup makes one pause and consider what manner of mare Pretty Polly must be; but Bachelor's Button, Mark Time, Sandboy, and Hackler's Pride are hardly first-class horses. A fairly good field came out for the Gold Vase, and a most exciting race for the trophy took place, Bachelor's Button, 9st. 13lb., admirably ridden by Maher, swooping down on Mark Time, 9st. 8lb., in the last stride, to beat him by a short head on the post, Hammerkop finishing third, half a length away. Mark Time appeared to have the race in hand, and many stringent remarks were made upon the riding of George McCall. It should be remembered that Mark Time is one of those generous horses that do all they can of their own accord, go no better for

W. A. Rouch. THE PARADE FOR THE GOLD CUP. Copyright

W. A. Rouch. *ZINFANDEL WINNING.* Copyright.

being ridden hard, and that McCall, knowing the horse and his peculiarities, no doubt rode him to the best of his ability. Ladas, Persimmon, Rock Sand, St. Amant, and Cicero are among the two year olds who have been returned as winners of the Coventry Stakes, and, as far as one can tell, this year's winner is destined to follow in their footsteps. His owner and breeder, Mr. W. Hall-Walker, must have been pleased to see his colt come striding home by himself, with the rest of the field hopelessly in the rear. The Ascot Stakes was won by Sandboy, another of that owner's representatives, who won from Karakoul by two lengths, with Pradella beaten into third place by three-quarters of a length; but I cannot help thinking that if Rickaby had not laid so far out of his ground, Karakoul might have been much nearer to the winner, if, indeed, he had not actually beaten him at the finish.

The principal race on the following day was the Royal Hunt Cup, for which Sir Daniel, hailing from the successful Foxhill stable, became the rage, and started at the short price of 9 to 4 in a field of twenty-five runners. There is certainly nothing much to like in the appearance of this colt; he appears to be cursed with a disposition which is anything but amiable. When it came to racing he would have none of it, and after showing in front for about four furlongs, began hanging to the left, destroying whatever chance Catty Crag may have had, by shutting him in on the rails. Pharisee made a great effort under his burden of 8st. 9lb., but Andover, 8st., had no difficulty in keeping him at bay, and ran home a gallant winner by a couple of lengths, with Dean Swift third. The result of the Forty-seventh Ascot Biennial must have proved disastrous to backers, the winner, Sir Waldie Griffith's Charis, by Cyllene out of Sweet Duchess, being the complete outsider of the party of fourteen. The race was never in doubt after she took up the running five furlongs from home, and although challenged by Brother Bill and Chiron, she won easily by a couple of lengths. Adula, the much-talked-of sister to the famous Pretty Polly, made her first appearance on a race-course in the Coronation Stakes; she is a filly of enormous bone and power, and with all the worst of the luck in the race showed no little speed, and was going well until she was nearly knocked over the rails about a quarter of a mile from home, when Commune, who started at 20 to 1, came on to win by three-quarters of a length from Amitie, with Cherry Royal third. Thrush and Sweet Mary fought out a battle-royal in the Fern Hill Stakes, but the colt eventually won by a neck; and in the Fifty-third Triennial Stakes Sir E. Vincent's Ulalume won a pretty race by a neck, beating Merry Moment and Lally into second and third places. If the actual racing on Thursday was not of the most exciting description, one had at all events the satisfaction of seeing some of the best horses of the day, Hackler's Pride, Delaunay, and Zinfandel being amongst the winners of the afternoon. Hackler's Pride had but a solitary opponent, Chaucer, in the Rous Memorial Stakes, but it was a treat to see the great raking daughter of Hackler and Comma come swinging up the course with the free, far-reaching stride which had proved all too much for her opponents in two successive Cambridgeshires. Much as we should all have liked to see Pretty Polly included amongst the runners for the Gold Cup, the race proved to be well worthy of its fame, in that Zinfandel, 9st. 4lb., set all previous records at defiance and covered the 2½ miles in 4min. 23 3-5sec. The French horse Maximum II. struggled on stoutly, but could not make any impression on Lord Howard de Walden's horse, who strode home a gallant winner by three lengths. The winner was turned out in splendid condition, and his brilliant performance will draw renewed attention to Persimmon, whose stock have been doing none too well of late, which is due, perhaps, not to any fault on the part of the horse himself, but to the injudicious selection of the mares which are sent to him. Curiously enough, the following race, the New Stakes, was won by a daughter of Persimmon, Mr. W. Hall-Walker's Colonia, who is out of Sand Blast, the dam of Sandboy. She is a remarkably fine, deep-girthed filly, with capital shoulders and quarters and the best of limbs; but when galloping she has a most curious style of progression, and goes very wide all round. However, she both stays and is fast, and proved altogether too good for the Ankles colt and Larino, who finished second and third. The Forty-second Biennial Stakes of 925 sovs. was won by Mr. J. Buchanan's Santry, who looks like proving a bargain to his owner, who gave 2,600 guineas for the son of Gallinule and E.P. at the

W. A. Rouch. *ZINFANDEL, BY PERSIMMON—MEDORA.* Copyright.

December sales. Cherry Lass cantered in front of her opponents in the St. James's Palace Stakes, and landed Mr. W. Hall-Walker's all-conquering colours first past the post by two lengths from Polymelus, a length and a-half behind whom came Selim third. Only five horses could be found willing to try conclusions for the Alexandra Plate of 1,500 sovs., over two miles six furlongs and a few yards, and of these Hammerkop had run third in the Gold Vase, Karakoul second to Sandboy in the Ascot Stakes, and Maximum II. second in the Gold Cup. Rydal Head had no business in such company, and Palmy Days was reported to be short of work, and was actually lame. Hammerkop made the running at a slow pace, and eventually finished a length in front of Palmy Days, who finished four lengths in front of the French horse Maximum II., who was evidently feeling none the better for his exertions in the Gold Cup. Quite an old-fashioned gamble took place over the Wokingham Stakes, and Sir Daniel was given a chance of improving upon his running in the Hunt Cup; but he ran worse than ever, and whatever he may be capable of doing at home, he is not of much account on a race-course. Nothing looked better in the paddock than Captain Forester's beautiful filly Queen's Holiday, by Royal Hampton out of Cimiez, and she had no difficulty in giving Holme Lacy 8lb. and a handsome beating; she had not turned a hair when she returned to weigh in, and her perfect condition is much to the credit of Fallon, the Netheravon trainer. Mr. W. Hall-Walker's filly Golden Table, running with the greatest gameness, completed the list of her owner's Ascot victories by winning the Windsor Castle Stakes, and the meeting was brought to a very appropriate conclusion by the victory of Polymelus in the Triennial Stakes. TRENTON.

GRINLING GIBBONS AND ST. JAMES'S CHURCH.

AMONG the craftsmen who, at one time or another, have worked in England, few have gained an appreciation so cordial and so universal as that accorded to Grinling Gibbons. His wood-carvings appeal so strongly to our love of Nature, and to our disposition to admire a thorough mastery of technique, that, for a long time, the historians of this country indulged vain hopes of claiming for him the distinction of having been a British citizen. It must have been with considerable regret that Mr. Lionel Cust, to whom we owe the first public announcement of the fact, was obliged to record that, by birth, he was a native of Rotterdam. But a letter, giving a full account of his birth, has been discovered among the Ashmolean MSS. in the Bodleian Library; and it relates, in mingled Dutch and English, that he was born in that city, on April 4th, 1648, possibly of mixed parentage, so that there may even yet be some foundation for the supposition that one of his parents was a Yorkshireman. We would gladly think this latter theory to be correct, but must not shut our eyes to the fact that, during the seventeenth century, the ornamentists of the Low Countries derived many of their most favoured themes from the fruit and flowers and occupations of the countryside, so that the nature of his art implies no corroboration of it.

"COUNTRY LIFE."

Copyright. *SECTION OF THE TOP OF THE PANEL SHOWING DETAIL.* "COUNTRY LIFE."

However, he was an Englishman by adoption. His life was passed in this country, and all his honours gained therein. Such of his work as is to be found without its bounds, was sent abroad in the form of honourable gifts; as, for example, the splendid piece in the Ducal Palace at Modena. And the larger part still remains among us, not only in our churches, but in those great country houses in which the whole nation takes so high a pride—Chatsworth, Belton House, Petworth, and the rest. It is to John Evelyn that Gibbons owed his opportunities. The famous "Diary" has many references to "that incomparable young man, Gibbon," as Evelyn generally terms him. He found him "by meere accident," working in a "poore solitary thatched house" near Sayes Court at Deptford, carving in wood the great "Crucifixion" of Tintoretto, and promptly brought him and his carving to the immediate notice of Charles II. (January 18th, 1671). The Queen, much to Evelyn's disgust, did not buy it, being persuaded therefrom by "a French pedling woman, one Mad. de Boord, who us'd to bring peticoates and fanns, and baubles out of France to the Ladys," although the modest price was but £100. The poor artist had to take his work back again to his cottage, though he afterwards sold it to Sir George Viner for £80. Yet Evelyn's untiring influence was of real service to him. To his introduction of him to Wren we owe the carving in St. Paul's Cathedral, and that done for the King (who appears to have been genuinely interested) at Windsor. And it secured for him a place in the Board of Works, as well as many private commissions. He is said by Walpole to have given to Evelyn his own bust in wood as a token of gratitude; but, if so, it is singular that the careful diarist himself should not have mentioned the circumstance; and no trace of the bust has since been indicated. He lived first at La Belle Sauvage Yard, Ludgate Hill, and from 1678 in Bow Street, Covent Garden, where he died in 1720, leaving a large family. His portrait was painted by Sir Godfrey Kneller, and engraved in mezzotint by John Smith; and there is also an engraving by the same artist of him, with his wife, after J. Closterman. He worked not only in wood, but in stone and bronze, and executed, among other sculpture, the statues of Charles II. at Chelsea and the Royal Exchange, while that of James II. at Whitehall, if not actually by him, was cast from his designs. When once established he was able to employ many assistants, and under his superintendence much of the decoration in stone of St. Paul's Cathedral was carried out. To Sir Christopher Wren, Gibbons was indebted, as we have already said, for many of his public opportunities, and among them for the commission to make the decorations which illustrate this article. The Church of St. James's, Piccadilly, was one of these. It was built by the famous architect for a new parish, which was finally separated from that of St. Martin's-in-the-Fields in 1685, by Act of Parliament; but had been already finished before that date, and consecrated on July 13th, 1684. Its homely but characteristic exterior gives hardly a hint of the splendour of the internal ornamentation. Architecturally it cannot rank with the finer productions of Wren's genius; but the funds available were very small, and the whole cost of the building is said not to have exceeded £7,000. Gibbons made the decorations for the altar at the outset, and on December 7th, 1684, we have his faithful patron's record of a visit of inspection. "I went to see the new church at St. James's, elegantly built; the altar was especially adorn'd, the white marble inclosure curiously and richly carved, the flowers and garlands about the walls by Mr. Gibbons in wood; a pelican with her young at her breast, just over the altar in the carv'd compartment and border, invironing the purple velvet fring'd with I.H.S. richly embroider'd, and most noble plate, were given by Sr. R. Geere, to the value (as was said) of £200. There was no altar anywhere in England, nor has there been any abroad, more handsomely adorn'd." To this description there is little to be added. The illustrations tell their own story, of the amazing ingenuity with which flowers and fruit, birds and shells are grouped and interwoven. The work is realistic, and is, as such, opposed to modern ideas of the essential principles of decoration; but its technical merits are such that our admiration for the craftsman who had attained a mastery so complete over his material, entirely overwhelms any adverse criticism. The realism of his treatment is not the only fine quality to be remarked. In spite of the grace and delicacy, and even apparent fragility of the result, his construction is always sound; and his carvings, here as elsewhere, are remarkable for their strength. Those at St. James's, it may be said, are of cedar, but he also used limewood, oak, and box in other work. Fortunately, we have still preserved many

Copyright. DETAIL OF LEFT-HAND PANEL. "COUNTRY LIFE."

examples of the skill of this great craftsman. He founded a school which had many followers and imitators, and in our day the Royal Academy has found space for sculpture in his style. But not all old wood-carving of fruit and flowers is by Grinling Gibbons. Even in the City churches a good deal generally ascribed to him is undoubtedly by inferior hands, and, though his output must have been enormous, care and discrimination are needed by the collector. Gibbons produced nothing of inferior quality, and the test of absolute merit is the best to apply to specimens alleged to be by him. EDWARD F. STRANGE.

DE NATURA.

BEFORE me at the moment are two learned books which have stirred up many old thoughts that I fain would reduce to simple and clear terms. One of the volumes is *The Interpretation of Nature in English Poetry from Beowulf to Shakespeare*, by Frederic W. Moorman. It is published at Strasburg, and issued as part of a German series. The other is of similar origin, though it comes in English dress from the firm of Routledge; it is *The Development of the Feeling for Nature in the Middle Ages and Modern Times*, by Alfred Biese.

I wish Mr. Moorman had cultivated a holy simplicity in his style, for his definitions of the words "Nature" and "Interpretation" puzzle me—they are so long and dull. But apparently he wished to draw all references to Nature in poetry into his net. Yet much of the finest Nature poetry is purely descriptive. Even when description is coloured by fancy it ought scarcely to be called an interpretation, as, for example, Sir Philip Sidney's

> "With how sad steps, O Moon, thou climb'st the skies!
> How silently, and with how wan a face!"

Definition is a task beyond me; but to me the most perfect, the most consoling poetry is that which, as it were, knits man to Nature. The good Sir Philip, in the passage quoted, is uselessly sentimental. He is reading his own mood into the moon, which in itself is neither sad nor joyous.

> "Mother of light! how fairly dost thou glide
> Over these hoary hills divinely led."

How delicate and fine and true is Romeo's description of moonlight in the garden—with not a shadow of humanity thrown into it:

> "Lady, by yonder blessed moon, I swear,
> That tips with silver all the fruit-tree tops."

And in the "grand old ballad of Sir Patrick Spens" there is the same unconscious recognition of Nature's indifference:

> "'Yestreen I saw the new new moone,
> Wi' the auld moon in her arm;
> And if we gange to sea, master,
> I fear we'll come to harm.'
>
> They hadna sail'd a league, a league,
> A league but barely three,
> When the lift grew dark, and the wind blew loud,
> And gurly grew the sea."

Poets, and prose writers, too, who say that the moon is "sadsome" and the owl and the nightingale melancholy, whose rains are usually weeping, whose winds lament and mourn, and whose sea-waves sob and cry, are certainly not interpretative. Yet there are strong bonds of sympathy between external Nature and the heart of man, though we sometimes forget it by reason of the artificiality of our lives. It is not possible that people in London, who have substituted electric light for the sun, and live very nearly the same in spring, summer, autumn, and winter, should feel the passage of the seasons as much as Addison's lady correspondent, who vowed she could engage to be virtuous all the year round if she could only escape the mood that May brought with it. And still even the town-dweller responds to Tennyson's:

> "In the Spring a livelier iris changes on the burnish'd dove;
> In the Spring a young man's fancy lightly turns to thoughts of love."

This is Nature itself, and the feeling was clearly and happily expressed centuries before Tennyson was born, as in "The Sowdane of Babylone":

> "Hit befelle by-twyxte March and Maye,
> Whan kynde corage begynneth to pryke,
> Whan firth and felde wexen gaye,
> And every wight desirith his like,
> Whan lovers slepen with opyn yze,
> As nightyngalis on grene tre,
> And sore desire that thai cowde flye,
> That thay myghte withe here lovere be."

And the feeling was far more beautifully and poetically rendered in a North Country poem of about the time of Cynewulf, which has been thus translated:

> "Soon as ever thou shalt listen on the edges of the cliff
> To the cuckoo in the copse-wood chanting of his sorrow,
> Then begin to seek the sea, where the sea-mew is at home;
> Sit thou in the sea-bark, so that to the southward
> Thou may'st light upon thy lover, o'er the ocean pathway
> When thy Lord with longing looks and waits for thee."

It is the poet's way of telling us that the same force which stirs the sap of the trees, and calls out bud and blossom, and brings the migrant home, and sets the birds singing, thrills also in the blood of youth and maiden. As the simple and plain lyrist of the thirteenth century puts it, "in the spring-time, the only pretty ring-time":

> "Worme woweth under cloude,
> Wymmen waxeth wounder proude."

The beginning of the ballad of Robin Hood is but a variation of the same descant:

> "In somer, when the shawes be sheyne,
> And leves be large and longe,
> Hit is full mery in feyre foreste
> To here the foulys song.
>
> To se the dere draw to the dale,
> And leve the hilles hee,
> And shadow hem in the leves grene,
> Undur the grene-wode tre."

In John Donne we have a spirited rebellion against the governance of the sun, which is, nevertheless, an act of homage:

"Busy old Fool, unruly sun,
Why dost thou thus
Through windows and through curtains call on us?
Must to thy motions lovers' seasons run?
Saucy pedantic wretch, go, chide
Late school-boys and sour prentices;
Go tell court-huntsmen that the king will ride:
Call country-ants to harvest offices;
Love, all alike, no season knows nor clime,
Nor hours, days, months, which are the rage of time."

It seems to-day as if the gods had willed that this disquisition should be of love and flowers and summer, and of the sweet and indissoluble union which binds us to Nature, whose children are the beast, the plant, the bird, and the human being, though in the arrogance of his spirit man sometimes speaks as though he lived in a higher world of his own. Some day, perhaps, we may return to the less attractive aspects of man's sympathy with Nature, for the field cannot be covered in a single paper. But for a while, at any rate, it is good to rejoice in that pure morning light that Shakespeare loved so, and depicted with inimitable skill. No one who has not been in the habit of tasting the pure light of dawn and the sweetness of flowers in it can appreciate what is in the Sonnets:

"Full many a glorious morning have I seen
Flatter the mountain-tops with sovereign eye,
Kissing with golden face the meadows green,
Gilding pale streams with heavenly alchemy;
Anon permit the basest clouds to ride
With ugly rack on his celestial face,
And from the forlorn world his visage hide,
Stealing unseen to west with this disgrace:
Even so my sun one early morn did shine
With all-triumphant splendour on my brow;
But out, alack! he was but one hour mine,
The region cloud hath mask'd him from me now."

In "King Henry VI." occurs a metaphor which tells of many a dawn spent probably between Stratford-on-Avon and Cirencester, the great wool-market which the young poet must have attended on his father's business:

"This battle fares like to the morning's war,
When dying clouds contend with growing light,
What time the shepherd, blowing of his nails,
Can neither call it perfect day nor night."

Let us close our remarks on a fine subject, to which little justice has been done, by quoting the most exquisite picture of coming morning that exists in any literature:

"It was the lark, the herald of the morn,
No nightingale: look, love, what envious streaks
Do lace the severing clouds in yonder east:
Night's candles are burnt out, and jocund day
Stands tiptoe on the misty mountain tops."

Morning, spring, and youth! how naturally they go together; and the wind itself does not travel over the mountain-tops with a finer indifference than the poet feels when he is most inspired: a truth which Goethe recognised and lesser lights have ignored.

The "pathetic fallacy," as Ruskin called it, is to believe that there is any correspondence between Nature and her children, as Scott did when he wrote that when the poet dies "Mute Nature mourns her worshipper," as Wordsworth did when he declared that the wizard left his favourite valley amid "weeping rain." Every manifestation of life is isolated. The wind sighs among the pine trees as softly in joy as in sorrow, different as the tune may be that the human mind reads into it. Yet though the parts are separate, they belong to the same gigantic machine, are moved by the same force, and respond to the same calls. If you look deep enough, Carlyle once declared, you shall always find harmony and not discord. And again he declared that it was "depth of insight" that made the true poet. So it is that the lesser bard is always finding some small grievance to rail at, while the greater is borne far away from all pettiness by understanding that every discord is superficial only, and that at the heart of things is a Divine harmony. In the examples quoted we have endeavoured to show this agreement as to a single point; time and space are wanting to go over the whole intellectual field and show, as could be done, that the observation applies to every part of it.

P. A. G.

THE SHELDRAKES OF LINDISFARNE.

"DUCKS are subtle," says the translator of Dr. Caius's immortal work on "English Dogges." But, sensible as are the other ducks, the sheldrake has more brains than any of the others. The eider, which, if permitted to do so, becomes domesticated of its own accord, and on the Norwegian "bird bergs" is a perfect nuisance because it will come into the cottages and make nests in the coppers or fireplaces, is perhaps tamer; but the sheldrake is, next to the eider, the most friendly to man, and, in addition, nearly always nests under cover—generally in a rabbit-hole in the sand-hills by the shore. Thus, while all the other ducks, such as the eiders, are having their eggs stolen by the gulls, or, in the case of mallard and teal, by carrion crows or magpies, the sheldrake is absolutely certain that nothing less formidable than a rat can interfere with her eggs. Rain does not soak through the many feet of superincumbent sand; so it is ten to one that this beautifully-coloured duck will hatch every one of her brood. Holy Island, or Lindisfarne, is a particularly favourable place for the sheldrake to nest. The whole of the "back" of the island, facing the North Sea, is fringed by sand-hills, the dunes in some

ST. JAMES'S CHURCH: RIGHT-HAND PANEL.

places being more than a hundred yards deep. Outside there are flat reefs, covered with acres of brown seaweed full of the food which sheldrakes feed upon—little crabs, sea-snails, crustacea of all kinds, "sea-rock" shrimps, and molluscs. On the land side, sheltered from the north by the sand-hills and from the east by a sea-bank, are large flat meadows, with wet drains in them, and a most delectable fresh-water marsh, to which the young birds can be taken in rough weather, or kept quiet for the first few days after hatching. Some five or six acres of open water are surrounded on three sides by masses of "horse-tail," or equisetum, a marsh plant, growing up like pointed green pencils, each adorned by a paint-brush at the top. With these acres of green rods are mingled numbers of one of the most beautiful of all marsh-flowers, the buckbean. One promontory, several yards in length, is composed entirely of buckbean leaves and flowers, growing as close as a begonia-bed, and more beautiful. The Lindisfarne sheldrakes seem to regard this corner of Holy Island as their peculiar property. At the time of the writer's last visit all the young sheldrakes had just hatched, and several very young families were either on the marsh or halfway between it and the sand-hills. Little sheldrakes are quite unlike their parents. Instead of being boldly barred with broad, transverse bands of black, white, and chestnut, these downy ducklings are white, striped with black and grey, lengthways of their bodies, resembling zebras, only with the lines running the other way. Nine of these, like a little fleet in perfect "column ahead," were swimming down a channel in the reeds, the old bird leading and the drake behind; but these both rose at once, and then alighted a little ahead in the marsh, where they swam about in some anxiety, occasionally rising and flying close over the young ones' heads. The broad masses of black, white, and chestnut, with the crimson bill and black head, render this duck a very striking object on the wing. Soon the young ones made their way through the reed-bed to the open water, where they joined another brood, and then the two squadrons, in the most careful order, left the water where a shelving bank touched it, evidently considering that it was an unsafe neighbourhood, and walked off up a kind of sheldrakes' road, leading for several hundred yards across a large pasture towards the sand-hills and the burrows where the young had been hatched. There was quite a little gathering of old and young sheldrakes in this meadow, among the crimson orchis flowers and the tall grass stems. A stone wall divided it from the sand-hills, but there was a gap in this, evidently well known to the birds, through which another pair were seen walking back "home" with their young as soon as they saw that visitors were near.

In the sand-hills, among the marram grass, haulm, and dwarf vegetation of this arid region, the birds were frequently seen sweeping on broad, white wings round the hillocks, or flying out to the seaweed-beds on the rocks. In a sheltered bay, backed by rocks crimson with masses of "thrift," and in places draped with a wonderfully vivid green carpet of sea-moss, another sheldrake family, equally juvenile, were riding out at sea in the usual order. The squadron consisted of six striped ducklings, all in single file, with one old bird in front and another behind. After some time they swam for the shore, where low breakers rolled in with white foam over the bronzy seaweed. In the foam all the little birds were rolled over; but they soon righted themselves and scrambled ashore. The word was given to "shake tails and get dry," which they all did, both old and young, and then the whole family went to sleep on the popweed-bed, the old ones apart, and the young in two clumps of the black and white stripes.

W. Rawlings. *AMONG THE SAND-DUNES.* Copyright.

Holy Island is divided from the shore by 3½ miles of hard sand, which is covered with water at high tide. Long lines of posts indicate the route, as carts cannot cross it for some hours before and after high tide. Driving to the mainland in the evening we heard the cry of a young duck, and found that a baby sheldrake detached from its family was swimming vigorously in the water not far from the cart, which was crossing a broad tongue of sea. The rest of the family were swimming some 40yds. away.

It will be seen that the birds, which are protected by law from being shot in the breeding season, are both tame and numerous. As they are quite unfit for eating, owing to the fishy nature of their food, it would be a sensible act to give them complete protection all the year round, instead of from March 1st till August 11th, as in Northumberland, or less in some other counties. The young birds cannot fly by the beginning of August, and are chased and shot on the water, and the old, too, often are killed at the same time. The sheldrake might have a

real value for the owners of sand-hills if preserved like the eider. In parts of Denmark and in Friesland artificial burrows are made for the ducks, with turves laid at the intersection where the nest is. Several hen birds lay in each set of burrows, and there are sometimes as many as a dozen or fifteen nests in a hillock 8yds. or 9yds. across. The hen birds are quite tame, and allow themselves to be handled. Each person in the village generally has one of these sheldrake colonies. The ground plan of a chamber gives twelve laying places, all approached by one entrance-burrow. It should be added that another duck, the Goldeneye, nests in holes in the forests of Norway and Lapland. Holes in trees are often used, especially those made by the great black woodpecker. The Lapps often place boxes, or hollowed tree trunks, near waterfalls and pools on the rivers frequented by the Goldeneyes, and so obtain the eggs. C. J. CORNISH.

CORRESPONDENCE.

A MIDNIGHT PICTURE.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I enclose a photograph taken at Kirkwall on June 16th of this year at midnight. Perhaps it may be of interest as showing the strength of the light at that hour even in these Northern latitudes. There is practically no night in Orkney in the month of June, and small print can be easily read by the light of the sky at midnight. The carolling of the lark is heard overhead all night, and the rasping cry of the corn-crake repeats itself from field to field, while afar off comes the subdued rush of the tide in some narrow channel. These sounds serve to make more impressive the tranquil midsummer night—that turning-point of Nature, in which there is something ominous, a foreboding of evil skies and pitiless winds which never fail to follow.—THOMAS KENT, Kirkwall.

MOTORS AND HYDE PARK.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I have put down my horses, have an electric brougham, and now, in the middle of the season, my wife cannot drive in the Park before dinner. It's rather annoying.—Y.

BOLDNESS OF THE JAY.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Some time ago my father was making experiments with the bones in the heads of field-mice and voles, and having no use for the bodies threw them out of the window on to the garden path outside. Not long after he saw a jay fly down and carry off one of the bodies. It is unusual for so shy and wary a bird as the jay to alight by the window of a house; but what surprised us even more was the sagacity which had enabled him to discover in so short a time the presence of these toothsome morsels. It was probably one of the jays that frequent the copse adjoining our meadow. They have since become very rapacious, and this year they are constantly to be seen in the shrubberies close to the house, where I fear they have robbed some of the smaller birds' nests. Wood-pigeons build in the trees near our flower garden, and yesterday I noticed two of these birds fly hurriedly away; then I perceived a jay clambering about in a small white hawthorn, apparently trying to reach an old wood-pigeons' nest which had remained there since last year. With the object of saving the new wood-pigeons' nests I frightened him away by opening the window suddenly, otherwise he would have suffered a keen disappointment.—IDA NORMAN, Strode Manor, Beaminster, Dorset.

LANDRAIL SHAMMING DEAD.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Referring to the letter of "Crex" on the above subject in your recent issue, a case came under my notice lately which would tend to confirm the popular belief. At all events, it shows that there is a strong element of cunning in the mental composition of this peculiar bird. A keeper of my acquaintance brought down one by mistake while going his rounds. When he picked it up for dead he put it in his bag, and on the way home handed it to a friend of mine, knowing that the feathers of this bird are useful for making artificial flies. The bird was thrown on the window-sill, and some time afterwards my friend observed that it opened its eyes a little. Seeing there was life in it, he put it in a cage, and when it was apparently well again he sent it to me, thinking I should like to have a photograph of it. This photograph is sent in the hope that you may consider it of sufficient interest for your paper. With the exception of a wounded wing there appeared to be nothing wrong with the bird. While in my keeping it took the worms dug for it quite readily, but it declined to take food while it knew that anyone was in sight.—CHARLES REID

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—The letter signed "Crex," in your issue of June 17th, induces me to put on record the following incident. I was walking one day across a field when a landrail got up almost from under my foot, much startling me. The bird, doubtless at least equally startled, flew rapidly away, but was marked down by me on a bank at the far end of the field. Wishing to have another sight of it, I followed the bird up, and was surprised that, when I came to the bank, the bird did not rise, though I shouted loudly. However, feeling sure that it was there, I searched about, and at last saw it crouching on the ground, and so close to me that I was able to seize it with my hand. It made no struggle, but remained quite motionless. Now, I had read in books that landrails sometimes simulate death, and was much pleased to have this seemingly ocular demonstration of the fact. I determined to see how long the sham would be kept up, so I sat down, putting the bird by my side, and watched. After the best part of an hour had elapsed my patience was exhausted, and picking the bird up I found it was actually dead. I took it home and examined it most carefully, but could discover no injury of any kind. The conclusion to which I came was that the bird must have died of fright. This incident occurred many years ago, but was recalled to my mind more recently on reading Hudson's "Naturalist in La Plata," where I found it stated that captured birds do sometimes die in the hand from terror, and that the spotted tinamon—a bird that in some of its ways resembles a rail,

and possesses the death-feigning instinct in a marked degree—when chased by boys on horseback, if it can find no thicket or burrow in which to take refuge, not infrequently drops down dead on the plain. It appears that the deathlike immobility is not a cunning trick, as commonly supposed, but an actual swoon—not a feint, but a faint—and that the swoon sometimes terminates fatally. It would be interesting to know whether the simulation of death that is so common among insects and spiders, and is not unknown even among mammals, ever terminates in actual death.—WILLIAM OGLE, M.D.

NEST IN A BROCCOLI PLANT.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I am sending you a photograph of a linnet's nest which was found in a broccoli plant in an allotment garden at Berkhamsted. The eggs were successfully hatched out, although the position was in a very public place.—X.

BIRDS IN THE SCILLY ISLANDS.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I have been much interested in your notes on the sea-birds in these islands, and by the letter by "H." in your issue of June 17th. As a resident here, and as one who takes a considerable interest in the sea-birds, I think I may say positively, without fear of contradiction, that the gannet does not breed in Scilly. It is a constant visitor throughout the greater part of the year, and, to those who are interested, it is an absorbing occupation to watch this fine bird hunting fish, as it does by the hour, and to see the way in which it plunges and spears its prey. "H." is quite right about the northern divers. They also, for the greater part of the year, are here in considerable numbers, and only leave us just before the breeding season, when their plumage is almost at its best. With respect to the shearwater "H." is partly right and partly wrong. I have often seen them, as he says, in the evening, flying in a north-westerly direction, but I have often seen them going the other way about, and, in fact, one evening not long since, in crossing St. Mary's Sound, they were flying round our boat in all directions. I should like to go more fully into this subject, but I fear your space is too valuable.—C. J. KING, St. Mary's, Scilly, Cornwall.

THE INCREASE OF SEA-FOWL.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—The reports from various haunts of sea-birds and rock-fowl, which formed the basis of the interesting article in the Summer Number of COUNTRY LIFE, will be read with pleasure by all who value the added life and interest given to coast scenery by the birds. In regard to one great sea-fowl city, the Farnes, I can corroborate the report of Mr. Pettit, the head-keeper of the Inner Farne light. Even a community like the winged population of these numerous islets has its ups and downs, the birds belonging to various "nations and languages" and having their own territories and local habitations, from which, like the tribes and races of mankind, they are from time to time compelled to move, either by natural catastrophes or by the pressure of stronger and aggressive neighbours. For instance, the cormorants of the Farnes nearly all nested by themselves on a low seaweed-covered rock called the Megstone. Twice in late years their nests were washed off this rock by storms in the spring, and, despairing of rearing their young, the whole of the black brigade moved off to a large island, the main population of which consists of black-backed gulls. The prehistoric cormorant is a simple and rather timid bird, and no match in the battle of life for the large and shameless gulls. In some 200 cormorants' nests, all placed close together and carefully built with seaweed, there was not one single egg, because the gulls devour them the moment the cormorants move off, which they do when any visitor lands. Only the remains of sucked eggs were to be seen. On the other hand, every other species of bird native to the islands seems to increase. It is no exaggeration to say that some seven or eight acres of ground on different islands are covered at intervals of only a few feet with the nests of the lesser black-backed gull. These are irregularly distributed, it is true, as they prefer the patches of vegetation, especially the coarse sea-grass and the beautiful sea-campion, to laying on the rocks. On the other hand, the puffins burrow wherever there is soil, so that in many places there are eggs on two floors, the ground floor and the basement, where the puffins burrow and lay. The soil appears to have been formed by centuries' decay of the sea-campion and other plants, aided by the droppings of the birds, fish bones, and decayed grass and seaweed. The sea-campion is of two kinds (unless these represent male and female flowers); one, larger than the other, has a bright green cup to hold the petals, the smaller a green cup veined with red. Both have an exquisite scent of honey, which perfumes all the air around. The various terns—Arctic terns, Sandwich terns, and lesser terns—are nesting in great numbers, and the interesting and beautiful eider-duck, the tamest of all wild creatures, are also on the increase. There are more oyster-catchers also, and the ringed plovers and peewits, of which latter birds a few pairs now nest annually on the Inner Farne, maintain their numbers. On the pinnacle rock there is not room for one single guillemot to be added to the crush on the summit, and overflow nests are made elsewhere. All the usual places where kittiwakes nest are also occupied, and these beautiful birds, with their sulphur-coloured beaks and pure white heads, do not in any way diminish. The only cause which checks a further growth of the colonies is to be found in the depredations of lesser black-backed gulls. These steal the eggs of terns, cormorants, eiders, and guillemots without mercy, and are like so many licensed thieves in a community devoid of police.—C. J. CORNISH.

NEST IN A COAL TRUCK.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Possibly the enclosed picture might be esteemed an interesting one for your pages. It was taken on the morning of June 19th, the nest being built in a coal-truck which had travelled from Newstead Collieries, and for the time being stood on the newly-constructed Great Central Railway at Sudbury, the parent birds—water-wagtails—having travelled with the nest and still favouring their interesting haunt.—A. NASH.

FLOWER-FARMING.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—As an established fruit and flower grower in Guernsey, I write in answer to "Frux" in your issue of June 3rd. There is a good opportunity for anyone to learn fruit and flower farming over here and qualify himself to start in the Colonies or elsewhere. But why choose the Colonies when, if managed properly, a farm here will pay from 10 per cent. to 12 per cent.?—F. NEVILLE WELLS, St. Martin's, Guernsey.

AN OLD INTERIOR

[TO THE EDITOR.]

SIR,—I enclose a print of an old interior in this town, which has been suggested as of probable interest to your paper. The room was in all probability the council-room, at a remote date, of the Butchers' Guild, the table in the foreground being the original mahogany one that was used.—H. JONES, Ludlow.

MODES AND MOODS

THE racing season, both at home and abroad, is in full swing, and the weather is fine enough for the display of the newest fashions in tailor-made dresses, for at the spring meetings "tailor-mades," whether simple or elaborate, are the only wear for the woman alive to the eternal fitness of things. I am, therefore, giving a sketch of a most original creation in this important branch of dress. It expresses in its combination of corselet and bolero and puffed sleeves the very latest Parisian ideas on the subject of a smart walking dress. The clinging skirt has completely triumphed over the ungraceful fulness of the early Victorian gathered skirt which obscured the beauty of women's outlines last year; and no one looking at the lovely lissom lines of the figure in the illustration can deny that this return to the sweeping, undulating, close-fitting skirt is a happy thing for well-made womankind. The material of the dress in the illustration is very fine silver grey cloth. The skirt is cut in panels shaped to the curved points of the corselet-yoke, which fits like a glove. These panels widen out towards the hem, and are double-stitched at each seam, and round the curves, where they join the corselet. The bottom of the skirt is trimmed with a design carried out in the wide-meshed silk braid which is so fashionable, headed by a narrow one, and folded pieces of the braid make diamonds on each seam. The little bolero is smartness itself; it is cut very short to accentuate the slimness of the waist, and hangs detached from the corselet, whose upper edge it covers. It is slightly gathered at the armpits under a chevron of braid, and the fulness thus given is again gathered under a line of braid which borders either side of the plain buttoned band in the centre of the bolero. This band forms small revers, bordered with Irish guipure, just below the neck, disclosing the under-vest and collar-band of the same guipure. The sleeves are full and puffed at the shoulder, but are close-fitting from above the elbow, and reach a little below it, where they are turned back with a miniature gauntlet cuff, the outside of the sleeve being ornamented with "key" designs in the braid similar to those on the bolero, both front and back, as is shown in the distant figure in the drawing. The hat to wear with this most original dress is of pale blue crin, turned up sharply at one side and at the back on a mass of shaded pink roses, and a garland of the same roses encircles the crown. Given the right figure, it would be impossible to excel the effect of this dress; but it certainly should not be copied by the short and dumpy. Another charming dress of this kind of idealised tailor-made that I saw lately was of finest black satin cloth, the skirt treated in much the same way as regards the stitched, curved yoke and panels, fitting like a glove over the hips, but not prolonged above into a corselet. The skirt was very long and full, and ornamented just above the hem with a double

A SMART RACING FROCK.

bias band of black taffetas. The bolero was gathered horizontally on the shoulders, which were cut in one with the full sleeves in a most charming way; and the fulness of the fronts was drawn down in a double pleat at either side, being held by a band of white and black embroidery on black silk, with silver flowers at intervals, which bordered the bolero all round. Though the fronts of the bolero crossed under embroidered buttons, still they could be worn open, when they show their white satin lining, and the chemisette of fine white appliqué lace over white silk, which was confined by a very deep-pointed corselet of black taffetas. The sleeves of cloth were very full, and only reached to the elbow; and from under them came close-fitting sleeves of alternate bands of folded black taffetas and white lace on white silk, the lace being allowed to hang for a couple of inches, interspersed with black silk knotted fringes. It was a most original and effective dress, and reflected the greatest credit on the well-known firm in Regent Street who built it.

This is a moment when it is well to remember the claims of the *débutante*, who is beginning to taste the joys of being "out" even before the season has regularly begun. On this page I give an illustration of an ideal dress for a young girl, which would serve for the small dinners and theatre parties which are her present training-ground before the rush of the season arrives. It is in soft forget-me-not blue chiffon, over that ideal material Liberty satin of the same soft colour. The only trimming on the cloudy skirt is bands of the satin of different widths, which have a charming effect, and are also of practical use in giving the chiffon sufficient weight to hang well. The bodice is of the chiffon, gathered very fully, over which hangs a deep flounce of fine white lace, gracefully arranged to hang in points over the sleeves. Above the lace is a tucker of three folds of soft white tulle, and through the lace is run a scarf of the soft blue satin, tied in a loose sailor-knot with long ends, which lose themselves in the close-fitting pointed corselet belt of pale blue satin, ornamented with rosettes of the same material. The very full sleeves of blue chiffon are finished at the elbow with bands and knots of blue satin. As I have said, it is an ideal dress for a young girl, and one that could be easily made at home by an ordinarily intelligent maid, which is an important attraction, for *débutantes* require a great number of dainty little evening frocks of this kind, and to have to pay fifteen or twenty guineas apiece for the required quantity runs into more money than most parents care about.

A DEBUTANTE.

These biting spring winds are apt to play havoc with tender skins and to roughen them irretrievably, so I would like to remind my readers that if they wish to keep their skins smooth and velvety, and their complexions clear and fair, they cannot do better than make daily and nightly use of Dr. Dys's Sachets de Toilette and his Sève Dermale. These two infallible ingredients combined in a face-basin of warm water make a soft milky lotion whose daily use will keep all wrinkles at bay, and give the complexion the clear transparency of a wild rose petal. All information concerning these invaluable aids to beauty can be obtained from V. Darsy, 54, Faubourg St. Honoré, Paris, who is Dr. Dys's sole agent.

The question of underwear is one that interests, or should interest, everybody; for bodily health largely depends on what is worn next the skin. There are many people who have a prejudice against woollen underwear, and yet at the same time suffer from the chilly feeling of linen next the skin. To all these the Empire Linen Mesh underwear will come as a very great boon. It is a knitted elastic material, made of the finest Irish linen yarns only, and while protecting the body from cold, freely allows the escape of perspiration. It is particularly well suited for summer wear, being both cool as well as protective against chills. The Empire Linen Mesh will not only not irritate the most sensitive skin, but its use will tend to allay any irritation which may already exist, and will cure eczema, nettle-rash, and effectively prevent that distressing thing, prickly heat. The mesh can be had in many different thicknesses, and samples of this most excellent material (which is guaranteed not to shrink in washing) can be had on application to the Irish Linen Mesh Company, Cathedral Buildings, Belfast, Ireland.

Easter will soon be here, and already the shops are beginning to show Easter eggs of all manner of variety. Valentines may have gone out with the mid-Victorian era; but the Easter egg has evidently a stronger hold on public affection as a form of timely gift. I was horrified, however, the other day to see in one of the largest London emporiums of things of the kind a whole series of Easter eggs adorned (?) with stuffed birds. One had positively four corpses of goldfinches set around it, another had a pair of bullfinches, and every egg or nest was set forth with these piteous little dead bodies by way of attraction. Surely a timely word of protest should be uttered by the members of the Society for the Protection of Birds against such a tasteless and wicked form of novelty, which has the further drawback of inappropriateness; for Easter symbolism should be that of birth and resurrection, not of death and corpses.

The moment of quarter-day generally brings about a recrudescence of growls at various items of domestic expenditure, notably that of electric light. Paterfamilias, when he sees the sum total for the light he has been enjoying during all the dark days of winter, sometimes gives way to the temptation of using strong language, which is neither a seemly nor a grateful habit. The fallacy in vogue at the present time, to the effect that electricity is considerably more expensive than gas, is due chiefly to a careless and immature consideration of the facts of the case. People are apt to overlook the fact that, although their electric light bills are slightly in excess of what their gas bills used to be, they are getting considerably more light and comfort for the extra expenditure. Taking candle-power for candle-power, with an intelligent discrimination as to the selection and renewal of electric lamps, the extra cost of electricity, if any, will be found so infinitesimal as to merit no consideration whatever, especially when its many overwhelming advantages in point of safety, hygiene, cleanliness, and superior artistic possibilities are borne in mind. The best way of effecting economy in the consumption of electric current, however, is to use lamps of the highest efficiency, and to renew them frequently. Many people imagine they economise by continuing to use their lamps even after they begin to burn dim, and this is the greatest possible mistake. Incandescent lamps steadily deteriorate in use, and require replacement at fixed periods to maintain the best lighting results. How long these periods should be depends on the kind of lamps used. With many lamps the economical limit would perhaps be little over 200 hours, while some of the higher-grade electric lamps, such as the British Thomson-Houston Edison lamps, can be profitably kept in use for 700 hours. The most costly mistake that electric-light users can make is to purchase cheap lamps, for they consume more current, give less light, are incorrectly rated, and are of poor efficiency and essentially low grade. For a bad lamp that burns dimly often is using more current, and consequently costing more money, than one of the B.T.H. Edison giving a splendid white light that fills the room with radiance. The moral is easy of deduction, and the world-wide reputation of these lamps is the best proof of its universal application.

SHOOTING NOTES.

PREPARATIONS FOR PHEASANT REARING.

WITH April already here, when the hen pheasants are beginning to lay, everything in connection with the business of rearing needs overhauling and putting into thorough working order. Those who wish to have early eggs and early pheasants, with a view to shooting their coverts before the leaf is off, will have transferred their hen pheasants, supposing that they keep them in aviaries through the winter, to the smaller breeding and laying pens. It is important that all the birds should now have more food, and better food, than earlier, graves and biscuit meal being added to what they have had before. They should also be given some beetroots or winter cabbage to peck frequently, not too much at a time, but enough to last them, say, for two days. The hens begin to lay about April 1st, and will lay on an average thirty good eggs each. Many will lay more than this amount, but the early eggs will be the object aimed at. The eggs will be picked up every morning, and will be collected and laid in shallow pans with moss or bran on them. This business of collecting the eggs and putting them to "settle" will go on all May, during which month there is plenty of time to have everything arranged and in order. But in March all the sitting-boxes should have been thoroughly cleaned and aired, the coops overhauled, disinfected, and made sweet, and the question of the rearing-field will also be decided. If it is intended to rear the birds on the ground where last season's crop of wood was cut, this can also be selected, as the cutting is now over. Many people are very late in selecting a shoot, or have to postpone this for good reasons. But it is essential to success to make an early start if possible.

LARGE PENS *versus* SMALL PENS.

On many of the large game farms very small breeding-pens are used, five hens and a cock being the most allotted to each. These pens are of wire, and are movable all in one piece. No doubt this plan has its advantages on a game farm where very large numbers of birds are in use. They are dog-proof, fox and cat proof, and can be shifted about over the fields. But on private estates it is cheaper and better to have large breeding-pens, which will hold some five-and-twenty birds, in the proportion of one cock to five hens. These should be surrounded with those excellent inventions, the Buckinghamshire pheasant hurdles, and the top left open for wild cocks to enter. The hens and cocks inside must, of course, have their wings clipped. Another good plan, if the pheasants are very shy, is just to place one row of ordinary wattle hurdles (long way upwards) outside the pheasant hurdles. These prevent the birds from seeing what goes on outside the pen. Wild birds are likely to lay very early this year, and the keepers are already looking out for stray eggs.

ARTIFICIAL GAME EGGS.

The following letter is from a reader who last year sent to COUNTRY LIFE some excellent specimens of artificial partridge eggs, of the right weight, but apparently not made of china, but of some composition looking like xylonite: "Sir,—I have much pleasure in giving your readers further particulars of my experiments with artificial partridge eggs. My gamekeeper found all the partridges' nests that he could; from all those in which the eggs were much exposed, or which were in an unsafe position from proximity to a road or footpath, he had the eggs removed as soon as three were laid, and artificial ones substituted. This went on until the whole batch was laid. The hen bird was then allowed to sit for two or three days at most, to make sure that she had finished laying, and she was then turned off and the artificial eggs removed. So far as we could tell she laid again in every instance. We used these eggs, taken from 'unsafe' nests, to make up the number in the safe nests to twenty or twenty-one, which the old bird hatched off just as well as she would have done the smaller number laid by herself. Not in one instance did the bird show the slightest objection to the artificial eggs, but laid to them, and sat on them, just as well as she could have done had they been her own. If other people's experience differs from mine, I think it must have been that the sham eggs were either too heavy or not sufficiently pointed to allow of their 'being stood up on end,' in the way a partridge always places them, or they may not have been smooth enough to the touch. We also use these artificial eggs as bait for trapping egg-stealing birds in the spring. On a rough grass bank, or in any clear space in a wood, we make a nest, furnish it with a few of these eggs, and in front of them we put a rabbit-trap, and then surround the place with a piece of rabbit-wire 3ft. high. This prevents the hen pheasants from going to the eggs; but the vermin first settle on the stakes which support the netting and reconnoitre, and then drop inside to enjoy the delicacy."

WILD GAME PREFERRED.

The stocking of small shoots, taken on yearly tenancies, emphasises the highly artificial nature of much modern shooting. We now see game farmers advertising to stock, rear, and manage shootings in as completely business like a way as Maple and Co. furnish hotels. Yet, if small shoots are taken on "by the year" and shot out, something of this kind must happen. The result is that the owners of large shootings are steadily directing their attention to securing a large head of really wild game, pheasants as well as partridges, which gives a *cachet* to their sport there often lacking elsewhere. At the same time, we do not mean to say that hand-reared pheasants, especially towards the end of the season, are less sporting birds to shoot than wild ones. There is practically nothing to choose between them. But it is far more satisfactory to the owner, even from the pecuniary point of view, for his game to be self-supporting.

SPRING TRAPPING.

It is no bad plan at this time to give notice that traps are being set in the coverts, and that favourite cats with a turn for roaming on forbidden ground had best be kept at home for another six weeks. Hedges should be trapped all the year round, but the gins there set should all be under gateway drains, or in small artificial tunnels made for stoats to run through, or in rat runs, though, as a rule, baited traps are far the best for rats. In any case, cats are not likely to be caught in them. The rat plague is very bad this year. A fortnight ago a short piece of hedge was ferreted, and the rats killed by dogs, in Sussex. Sixteen doe rats, full of young ones, were killed in this one short piece, next to the high road. Stoats and weasels also "begin to run," in keepers' phrase, and are more easily caught, because they are much more on the move, especially by the water-side. One thing is certain—that you can never clear an estate of vermin. Records kept for years on very large properties show that the head of vermin killed by all possible means does not grow less every year. On the other hand, vermin will soon clear an estate of game.

THE FERRET HUNG UP.

ON THE GREEN.

IT is a sign of the season that the competitions at Cannes arranged in honour of the team of Hoylake golfers, including Mr. John Ball, jun., and other notable men, had to be put off on account of the bad weather. The weather has been evil this spring all over the South of France, and the play for the Grand Duke Michael's prize had to be put off on account of excessively heavy rain. In the meantime, however, Mr. Ball won the open prize, given by the Nice Club, with a score of 159 for the thirty-six holes; but when the prize meeting at Cannes could at length be brought to a finish the penalised men were out of all handicaps. At Biarritz, too, the handicappers had dealt so hardly with the best players that the second round in the tournament for the prize given by the town of Biarritz, which is far the most important, from the point of view of its intrinsic worth, of all those given during the season, was fatal to all the most heavily handicapped—Mr. Dick, Mr. Angus Hambro, Mr. Osmund Scott, and Mr. Hutchinson all going out in this heat. Mr. Ball, in winning the cap ain's prize at Cannes, showed that he was in fine form, and Mr. G. W. Hillyard won another of the numerous (perhaps too numerous) competitions with a good score. Mr. Charles Hutchings has been playing the game dear to the heart of the good player, showing what can be done with a single club, and that club the putter. He backed himself to go round under 90, and accomplished the round (on the Cannes course, be it understood) in three strokes less. It is the kind of performance that is a constant surprise to those ingenuous souls who do not know the game—a constant surprise that with a single club a good player can do so well; but we might have thought that by this time of day the golfing world had grown too old and grey in its iniquity to be capable of much surprise thereat. After all, it is a pity that these things should be possible, for they seem to give justification to the artless question of the man who sees golf for the first time: "What is the use of having all those sticks?" And in point of fact the truth is, probably, that the "sticks" are multiplied quite unnecessarily. But as for this good performance on the part of Mr. Charles Hutchings with his putter at Cannes, although it does not thrill most of us, perhaps, with the emotion that it evidently excited in the breast of the man who wrote the account of it which I read, still, we must all be glad to hear of it, as an evidence that Mr. Hutchings is restored to that good golfing health which he seemed for a while to have lost. With the date of the Amateur Championship already becoming imminent it is well to put on record these doings of ex-champions. The Open Championship is later in date, but the work of those who are most likely to make a good show in that greater competition is worth no ice, and especially notable is the fine form of Taylor, repeating his victory over Braid at Rye, at the end of last season, by very nearly as heavy a balance of holes in the opening match of the present season. It is virtually the opening match so far as the first-class professionals are concerned, and, perhaps, it may be taken as an omen. For Braid's sake it is to be hoped that it may not. HORACE HUTCHINSON.

MANY of the greatest masterpieces are so difficult that only one or two of the very foremost pianists can play them. The Paganini Etude No. 2 by Liszt, the arrangement by Rosenthal of Chopin's Op. 64 No. 1, and Leschetizky's Intermezzo in Octaves are instances. Yet to the Pianola they are just as easy as the simplest folk song, and wonderful as this may seem it is by no means the chief of the Pianola's claims on your attention. With the Metrostyle Pianola you can play the rolls that Grieg and Bauer and Chaminade have interpreted and in the same manner, at the same tempo, and with the same effect as these artistes rendered them. And another point, your are given every facility to interpret every one of the Thirteen Thousand different compositions contained in the Pianola repertoire, according to your own conception of them.

Musical knowledge is not the essential thing in Pianola playing, but musical taste, and to a greater or less extent this is common to all.

You are invited to investigate the Metrostyle Pianola at Æolian Hall.

WITH THE BEAGLES.

Copyright DRAWING. "COUNTRY LIFE."

FROM many points of view hunting with beagles is a most commendable form of sport. It is, perhaps, peculiarly adapted for those genuine lovers of hounds and hunting whose pockets are not too heavily lined. It is, moreover, a thoroughly clean and manly sport, and there will not be much wrong with the man or woman who is in condition to follow the little hounds on foot; added to which there can be no better school for a future Master of Hounds than to begin at an early age to watch the habits of these miniature hounds, to see how they puzzle out the problems of a catchy and delicate scent, and to learn how and when it is advisable to assist them in their work. If the cunning of a hunted fox has become almost proverbial, those who have hunted the hare, either with harriers or beagles, can vouch for it that the timid hare is by no means wanting in subterfuge or resource; but her artfulness is better seen when hunted with beagles, for, although they will stick to a scent with such pertinacity that they may wear the quarry down, yet they are not possessed of sufficient speed to drive it so fast that it, so to speak, loses its head; and the writer has often witnessed, with a keen enjoyment, the hunted hare evidently thinking out schemes for the outwitting of her foes, and not seldom putting them into execution with much success; and to the onlooker who is content to remain perfectly quiet much additional interest and amusement are derived from watching the efforts of the little hounds to discover the solution of the problem set them by the hare, and listening to the glad outburst of music which proclaims success.

It is difficult to account for the etymology of the word beagle. There seems to be, however, some probability that it is a corruption of an old French word, while others declare that the derivation of the word is to be found in the old North Country expression, to "boggle," used principally with regard to beagles, as indicating the comparatively slow pace at which they give chase. "Oh, ay! they just go 'boggling' along," is what an old huntsman had to say in reply to an enthusiastic description of a run with the beagles. Be that as it may, no one who tries the experience of a day with the Warwickshire Beagles will have any cause to complain of their "boggling along," and, if one wishes to keep up with these beautiful little hounds, healthy lungs and clean muscles are just as necessary to the hunter who pursues on "Shanks's mare" as they are to the candidate for Grand National honours.

There are several different types of beagle. Of late years there has been a tendency, which is by no means to be commended, to increase their size, which in the best type of the genuine old-fashioned hound was not much in excess of from 12in. to 13in., whereas many of the modern beagles measure from 14in. to 16in. It is true that they can cover more ground and go faster than the older type, which is of course a desideratum with a good many people. Even the smaller beagles will run clean away from their field if the country be open and the scent good; and the writer well remembers a most exciting afternoon on Salisbury Plain with some beagles which had

FOR ALL WOMEN READERS.

April 8th is the Date.

A New Development in Newspapers for the Country House

It has for some time past been the aim of *The County Gentleman* to constitute itself the ideal Illustrated Country House Paper. While the proprietors think that this aim has been successfully kept in view for men, they do not consider that they have hitherto dealt in sufficient detail with those subjects which are of exclusive interest to women.

Women readers interested in country pursuits have no doubt found their favourite sports, pastimes, and avocations, well represented in the columns of *The County Gentleman*, but reasons of space have hitherto prevented full justice being done to subjects exclusively feminine.

The problem before the proprietors of *The County Gentleman* was thus, how to give more adequate representation to the interests of the feminine inmates of the country house without unduly encroaching on the regular and masculine features of the paper—in a word, how to satisfy the County Gentlewoman without invading the special domain of the County Gentleman. It is believed that a way out of the difficulty has been found which will prove satisfactory to all concerned.

It is proposed to present with every copy of *The County Gentleman*, each week, a separate Woman's Supplement, under the name of **"THE FASHIONS REVIEW,"** which cannot fail to interest all intelligent and refined women. This Supplement being intended for readers living in the country, will be conducted on lines rather different from those of the admirable women's papers which form so conspicuous a feature of modern journalism.

Shopping by Post.

Women in the country are naturally anxious to learn what is being sold in the London shops. Several columns of **"THE FASHIONS REVIEW"** will therefore be devoted to a weekly account of the novelties to be found in the London shops—a feature which will greatly facilitate Shopping by Post.

Next, as readers in country houses desire to keep themselves abreast of the Continental as well as of the English fashions, extracts and quotations will be given weekly from the principal Foreign Fashion Papers, special prominence being given to Parisian and Viennese journals.

In fact, the Supplement will be a Fashions Review of Reviews. Since, however, ladies will wish to show these extracts and quotations to their maids, they will in all cases be translated into English. In this way the country readers of *The County Gentleman* will be offered a weekly review of the Foreign fashion papers, such as has never been attempted before.

Another difficulty may be noted, which is often felt by women when they wish for information from the English fashion papers on some particular item of dress. The number and variety of Women's Journals now published in England is so great that no woman can take them all. Town readers who belong to one or more Women's Clubs have, no doubt, an easy remedy, but women who live in country houses cannot go and turn over the papers on a club table. It may therefore happen that though the very description or drawing of a coat, a gown, a blouse, or a hat needed by them is in one of the women's papers, they are quite unaware of it.

Guide to the Fashion Press.

"THE FASHIONS REVIEW" will meet this difficulty by providing a GUIDE to the English fashion papers, where, under appropriate headings, the various subjects dealt with will be classified. Thus the woman who wishes to know what information, say on Evening Gowns, is to be obtained in the recent papers, will look at the heading "Evening Gowns," in the Guide to the Fashion Papers, and see that such and such a paper deals at length with the subject in that week, and that such another has a specially good pattern of an Evening Skirt, etc., etc. Similarly, the woman who wishes for information as to hats will look at the heading "Hats," and find that in the week in question certain papers are specially informing on the subject of head gear. Thus the woman in doubt will be helped to find her way through the labyrinth of the ladies' press, and will learn exactly what paper or papers are likely to give her most help.

Two Papers in One.

It is, as we have said above, the intention of the proprietors of *The County Gentleman* to **present** their readers with **"THE FASHIONS REVIEW" free,** the price of *The County Gentleman* being, as heretofore, sixpence.

Purchasers of *The County Gentleman* will, therefore, in future obtain what will, in fact, be **two separate papers at the price of one.**

The First Number of "THE FASHIONS REVIEW" is now ready and can be had at all Newsagents and Bookstalls.

In view of the fact that *The County Gentleman* will thus appeal to all inmates of the country house, we suggest that readers of this announcement who desire for themselves and their families an illustrated country-house newspaper should fill in the following order form and hand it to their newsagent, or post it direct to THE PUBLISHER, *The County Gentleman*, 3, Wellington Street, Strand, London, W.C.

ORDER FORM.

I desire to become a trial subscriber to "The County Gentleman," including "The Fashions Review," for Three Months. Please send me the two papers regularly every week, post free. I beg to enclose you Seven Shillings (in stamps, postal order, or cheque). Foreign Subscribers 8/2.

Address _____

N.B.—Should you not care to become a three months' subscriber your newsagent will reserve "The County Gentleman" for you every week if you hand him the above order form with the underlined portion struck out.

Copyright *NEARING THE END.* "COUNTRY LIFE."

been sent on approval. We had no horn, so the barrels of a twenty-bore, belonging to a lady of the party, were pressed into service for that purpose, and a most excellent "note" can be blown in that manner. We were not long in stumbling, not upon a hare, but upon an outlying fox. None of us knew the hounds, and they knew no control; off they went as hard as they could lay legs to the ground, and it was not long before they had run clean out of sight, nor very much longer before they were out of hearing as well. In vain did we blow long-drawn notes of recall upon the gun barrels. Time went by, and we were nearly giving up all hope of seeing our erring pack again, when suddenly, on a fitful puff of the breeze, came a far-off burst of melody. The sound seemed to be coming in our direction, and sure enough in about another 20min. or so the merry "cry" drew nearer, and we saw a stout old Down hare stretching himself out like a race-horse, with the little hounds toiling gamely on behind him. A long check at a young larch planting gave us time to get up; but, oh! the job we had to get hold of our "hounds on approval." Handkerchiefs, braces, and other stray portions of attire had to be called into requisition to couple them up; but it was accomplished at last, and with a triumphant blast on the gun barrels we wended our way home, thoroughly tired out and footsore. That same scratch lot of beagles were sent abroad to be used for driving roe-deer to the guns, and the writer has since heard that they "entered" uncommonly well to their novel work.

Perhaps some of the prettiest work with beagles is to be seen in the "North Countree," and mention of the famous meet at Buttermere with the Cockermouth will, no doubt, recall many pleasant memories to those who are still sound enough in wind and limb to enjoy the "breasting of the brae," as well as to some who have had to pitch their tents far from the fresh, fragrant winds that sweep over the glorious expanse of the Cumberland lakes and fells.

To most healthy men there is sheer joy in the strenuous exercise of their strength, and when the muscles are clean and healthy, and the lungs are working freely, there is an added sense of physical enjoyment, as mile after mile is traversed, and the steepest braes are climbed, cheered on by the musical cry of the sturdy little pack. Those who follow the beagles, as they ought to be followed, must be clean and healthy of body; from that to being equally clean and healthy of mind is not a very far step, which was evidently in the thoughts of Dr. Warre, the universally-respected head-master of Eton College, when not long since he refused to listen to the suggestion that the Eton College Beagles should no longer be allowed to exist.

Copyright. *PUZZLED.* "COUNTRY LIFE."

There are, fortunately, plenty of packs of beagles in the country, and every encouragement should be given to them by all who have it in their power to assist a very manly and healthy form of sport. Warwickshire is a sporting county from end to end; the Warwickshire and North Warwickshire Foxhounds are known wherever the note of a horn has ever been heard, and when the great dog hounds settle down to their work, bold and true must be the man and the horse that can stay with them in a burst from Shuckboro' Gorse. The sporting reputation of the county is well carried on by the Warwickshire Beagles under the Mastership of Mr. H. A. Browne, with Dr. Hollick, Mr. A. C. S. Glover and Mr. R. Hollick officiating as whips.

The pictures of these hounds convey an excellent idea of what a pack of beagles should be. T. H. B.

Can Agriculture be Saved?

THAT the state of agriculture is bad, that the condition of the rural population is worse, that there is urgent need of reform in many matters that concern the country side is generally admitted. For the purpose of remedying these evils a vigorous and practical programme appears in this week's

LAND & WATER Illustrated.

THE POLICY ADVOCATED INCLUDES:

I.—Reform in the present Rating System; II.—Improving the housing, the surroundings, and the education of the rural labourer; III.—Improving the economic conditions of Agriculture; IV.—Increased facilities for selling and forwarding countryside goods; V.—Restriction of all unnecessary expenditure by local authorities; VI.—Assisting agriculture by State legislation and State money; VII.—Reduction of taxation on all cultivated lands.

THE MONACO FORTNIGHT.

THE PRINCE OF MONACO, who was accompanied by his son, Prince Louis, together with Prince Ferdinand of Bulgaria, Prince Galitzin, the Duke Philip of Saxe-Coburg, Prince and Princess Dolgorouki, Lord and Lady Craven, and others, opened the motor-boat exhibition at Monaco last Sunday, in the presence of a large number of British and American visitors. The exhibition constitutes a prelude to the actual racing, which begins next Sunday, and it is of importance to note that no boats which arrive during the present week will be allowed to take part in the various competitions, which will therefore be confined to the sixty-one vessels which were duly installed within the exhibition enclosure at the time of the opening. The number of absentees is, therefore, considerable, as the entry list had attained a total of over 100 boats, made up of 38 racers, 55 cruisers, 4 yachts, and 10 launches and fishing-smacks. Naturally, the most interesting events will be in the racing classes, and particularly stirring will be the contest between Napier II., Mercédès-Charley, Palaisoto I., Hotchkiss II., C.G.V., and Mme. du Gast's boat La Turquoise; while all the boats in the 12 mètres to 18 mètres class should be capable of doing astonishing performances. Of course, they are more or less unknown quantities, and one does not know whether their hulls are on the right lines or not. At the same time, size is essential to speed, and much is expected of the new type of boat. Last year, it may be remembered, 12 mètres was the maximum length permitted, and the extent to which the longer boats will prove their prowess affords food for much interesting speculation.

THE CRUISER ENTRIES.

Picturesque as they are from the speed point of view, however, it is to the cruisers we must look for the real practicability of the motor-boat, and for the promise of developments which may quite conceivably lead in the long run to the general adoption of the internal-combustion motor for marine purposes. The racers are practically fair-weather boats, but there is no reason why cruisers should not be built of sufficient substantiality to withstand any weather. As the following list will show, the number of entries in the Cruisers Section is considerable. Less than 6½ mètres: Avenir III., Lanturlu, Muguette, Cambouis, La Marguerite, Pitchounet, Titan VI., Joliette III., Chantiers d'Antibes I., Delahaye VI., Takumono, Delahaye V., and Dyonisien. In the 6½ mètres to 8 mètres class

A CRUISING MOTOR-YACHT.
Napier Major off the Embankment.

appear: Nelly, Excelsior VII., Le Nogentais, Arion IV., Antheor, Kiss III., Chantiers d'Antibes II., Chantiers d'Antibes III., Titan III., Nano, Mets-Y-En II., Isis II., Delahaye IV., Delahaye V., Luciole, Bigort-Delahaye, Usona III., Herald I., and Gardner-Serpollet. The 8 mètres to 12 mètres class includes New Comet, F.I.A.T.X., Ibis, Féfé I., Diétrich III., Berliet V., Rafale, Têtu, Elise, Chantiers d'Antibes IV., Suzette II., Sam I., Paulinette, Forcès-Pas, Delahaye I., Gardner-Serpollet, and Dragonfly. The fourth class (12 mètres to 18 mètres) comprises Rotceh, Diétrich II., Jeannette, Chantiers d'Antibes V., and Mercédès C.P. There are four yachts, namely, the Mercédès-Mercédès, Quand-Même, Malgré-Tout, and Turgan, fitted with Mercédès, Beaudoin, Roche, and Turgan motors respectively. The Quand-Même is no less than 22 mètres in length, and it will be highly interesting to note how this new type of vessel will compare in actual performance with steam yachts of the same size. Only four fishing smacks are entered, but it is safe to say that by this time next year this class of vessel will have considerably increased in numbers, for its utility is beyond question.

THE MONACO MOTOR-BOAT MEETING.
A corner of the exhibition showing the travelling cranes.

MOTOR-BOATS OF 1905.

LAST week there was launched at Lowestoft, from the yard of Messrs. F. Miller and Co., the largest cruising motor-yacht that has been built in England this year. Her over-all length is 45ft., load water-line 40ft., beam 9ft. 6in., and moulded depth 5ft. 8in. Her displacement is about 12 tons, and the four-cylinder 20 m.p. Napier motor with which she is fitted is sufficient to propel her at a

speed of between eight and nine knots in fair weather, and to give her headway in the teeth of a strong gale. Napier Major, as she has been christened, is built of larch, with oak frames, steel floors, and three steel strengthening frames. As will be seen from our illustration, the little vessel has a raised cabin-top, which gives 6ft. headroom in the cabin and engine-room. This cabin-top, which varies in height from 12in. at the after end to about 5in. forward, is fitted with dead-lights and ventilators, and also with scuttles on either side. There is a round hatch forward, in order to give quick access to the cabin. Aft is a cockpit made water-tight and self-draining, and arranged with portable benches. The companion leading from the cockpit to the engine-room is closed, for the sake of security, with sliding boards which drop into slots, instead of folding doors. In the bulkhead which separates the cockpit from the engine-room is fitted a scuttle, inside of which is placed the steering compass. The cabin, which leads out of the engine-room, is provided on either side with berths, which, in the daytime, can be turned up against the ship's side. Beneath the berths are pegamoid-covered seats, and forward on the starboard side is a sideboard and hand-basin with a signal-flag locker above. A bulkhead partitions off the fore-peak, in which is placed the water-tank, chain lockers, and pantry fittings. Generally speaking, the cabin space has been carefully utilised, and there is ample storage-room for clothes, provisions, crockery, oilskins, and the hundred and one etceteras which are required on a lengthy tour. With the exception of the engine-room, which is panelled in pitch pine and teak, the interior is finished in white enamel, and the whole appearance of the internal arrangements is that of a boat equipped for hard, practical service. The main fuel tanks, which are sufficient for a 3,000-mile run at full speed, are arranged aft in the cockpit, and are protected by teak bulkheads.

Napier Major is fitted with a stout pole-mast and yard; the sail, however, is only for steadying purposes. She is finished with a green under body, black top sides, gold band, and American elm rubbing-strake, teak covering board with galvanised iron stanchions, yellow pine deck, and teak coamings and fittings. The cabin-top is cream colour, and, besides the ordinary kedge and chain cable, an extra heavy anchor and cable is carried, as well as a sea anchor.

The day after she was launched, Napier Major, with a party of seven on board, "steamed" round to the Thames, and for several days formed an object of interest off the Temple Pier. She has now left for the South Coast, but will shortly return in order to be prepared for a lengthy trip to the Scottish ports.

A "King's Highway" in the States.

MOTORISTS on this side of the Atlantic who are accustomed to the magnificent roads of Western Europe and are wont to grumble at a patch of

A "ROYAL ROAD" IN CALIFORNIA.

FORDING THE SANTA MARGARITA.

unrolled stones, or any stretch of surface less smooth and flat than the proverbial billiard-table, are, perhaps, incapable of realising the appalling difficulties that often beset the driver in America who ventures beyond the confines of the great cities. We have received a vivid account taken from *Los Angeles Times*, which describes in characteristic language a trip recently undertaken in California by an energetic owner of a 15 h.p. White Steam car. There does not appear to have been any marked disposition to choose the easiest road or minimise the enormous difficulties of the journey, and we are inclined to regard these sensational achievements as somewhat in the light of a deliberate misuse of a good car. At the same time, the description of the journey, from which we give a few excerpts, and the photographs taken *en route*, two of which we reproduce, prove conclusively that the White is no fair-weather machine. We have it on the authority of Mr. Coleman, the London manager of the firm, that it is possible to pass through water up to the footboards without extinguishing the burner on the White, and that even if the furnace is flooded the heat in the coil is sufficient to reignite the burner, provided the passage of the ford is not too prolonged. The "road" followed on the present occasion was the old El Camino Real, between Los Angeles and San Diego, the first road constructed by the Spanish missionaries in the sixteenth century. The Camino Real is the "Royal Road" or King's Highway, which exists in every Spanish country.

The journey was undertaken with the object of visiting some proposed motor-races at Coronado Beach, but on arrival it was found that a heavy gale had played such havoc with the track that the meeting had been abandoned. Starting from Los Angeles on a Sunday morning, Oceanside was reached the same night, after fording the San Gabriel River three times in water up to the hubs, as well as crossing streams of considerable size near Capistrano. On Monday Mr. Ryus, the owner, and three companions resumed the trip. The first obstacle encountered was the swift Santa Margarita River, which proved to be 75ft. wide and 3ft. deep in the middle. Some twenty miles north of San Diego was an extensive bog, the Sorrento Marsh, which, though usually passable for any car, on this occasion presented three miles of wildly-running water. Finally, after a back-breaking drive up and down a narrow water-choked gully, they reached a ranche whose occupant advised them "to stop right there," as he had already lost a horse in trying to reach civilisation and fresh provisions. The motorists persevered, however, and the remainder of their adventures are thus summarised by *Los Angeles Times*: "Wading painfully through water over the wheel-hubs and pouring into the tonneau of the big machine; floundering about in seemingly bottomless mud, whose consistency felt about one degree more substantial than that of pea soup; breasting roaring rivers of brown rain floods that momentarily threatened to engulf the car; building nine impromptu bridges to cross holes too deep for fording, H. D. Ryus and a trio of other auto enthusiasts achieved one of the most remarkable endurance feats in the history of this *fin de siècle* sport when they succeeded in making the run to San Diego early last week over roads that had been found impassable for teams and had drowned at least one horse."

The Gordon Bennett Cup Race.

The list of entries for the French Eliminating Trial is now closed, and we therefore append the names of the entered cars and their respective drivers:

Cars.	*Drivers.*	*Cars*	*Drivers.*

It will be noticed that the De Diétrich and Hotchkiss firms have each entered a full team. Concerning the first-named, rumour had it that the makers themselves had decided not to take part in this year's events, but that their drivers induced them to adopt a different view of the importance of the contest, and with success. It would have been eminently foolish for the De Diétrich firm to withdraw just when they were forging their way to the front. They had annexed the crack driver, Gabriel, from the Mors firm, and had shared a considerable amount of the glory of last year's Trial, for

Gabriel came in fourth, and Rougier on a Turcat-Méry, which is virtually the same thing as a De Diétrich, came in third. The house of Mors is practically the only notable absentee from this year's list, notwithstanding all the protestations and definite "refusals" to compete when the projected race for the Grand Prix was abandoned. The fact is that makers cannot yet afford to do without the advertisement that racing affords.

THE AUVERGNE CIRCUIT.

Several of the foreign competitors have already been sampling the Auvergne Circuit, among them being Jenatzy, Lancia, Gabriel, Rougier, Alexander Burton (who will drive a Mercédès), Hemery, Heath, Girardot, Sisz, and Bernin. All testify to the difficulties of the circuit, as regards mountain gradients and sharp corners, the latter, of course, being the chief obstacle to speed. Mr. Burton estimates that an average of fifty miles an hour over the whole circuit will mean a very good performance for car and driver alike, and that success will be to the cautious driver, provided with a robust car fitted with tyres strong enough to withstand the tremendous strains which the corners will involve. It appears highly probable that, owing to these corners, there will, after all, be two or three controls, and that the race will not be run, as was stated last December when the circuit was first fixed upon, without any neutralisations whatever. Gabriel, who is a dashing driver, is equally of opinion that prudence will win the day, coupled with unlimited practice on the course; in fact, he and Rougier are going to drive over it daily for several weeks. Rougier suggests, half in jest and half in earnest, that nets should be erected at certain spots, in the same way as is done on one or two awkward bridges on the Riviera roads.

THE SCOTTISH RELIABILITY TRIAL.

It is officially stated that entries are being received in a most satisfactory manner for the Scottish Automobile Club's Reliability Trial, which is to be held on May 11th, 12th, and 13th next. The cars already entered include the following makes, some of which are represented by several types: Albion, Argyll, Ariel, Arrol Johnston, Chenard and Walcker, Daimler, Darracq, Gladiator, Humber, Minerva, Mors, Peugeot, Siddeley, Sunbeam, and Swift. The chairman and secretary of the western section of the club have lately been over a considerable portion of the trial route, for the purpose of inspecting the condition of the roads and making preliminary arrangements. For some reasons it is to be regretted that the annual Glasgow to London trial has been abandoned in favour of this event; but there is no doubt that the latter will be extremely interesting, and will provide opportunities for a severer trial than the journey from Glasgow to the metropolis. It will also serve to popularise the motor-car in Scotland, where its use is chiefly confined to landed proprietors and visiting tourists, excepting, of course, in the large centres, such as Edinburgh and Glasgow.

PETROL AT THE BOAT RACE.

To automobilists the Inter-University Boat Race possessed an added interest, because for the first time petrol motor-boats were used in connection with the event. The old paddle-steamers were abandoned—they were always much too slow—and various launches were employed instead for the umpires, other officials, and Press representatives. A number of the last-named were accommodated on a Yarrow launch, fitted with 70 h.p. petrol motor of Napier design, but actually built in Messrs. Yarrow's own factory. This boat is capable of doing 16 knots, and she had not the smallest difficulty in keeping close up to the competing crews throughout; in fact, she had to be held back. The Pressmen on board were much more fortunate in consequence than those on two of the other launches, which came into collision owing to the steering gear of one of them breaking down.

A WOLSELEY TRANSPORT LORRY.

A WOLSELEY TRANSPORT LORRY.

It is well known that the Wolseley Company has for some time past been paying a considerable amount of attention to the heavy motor-vehicle; and we reproduce on this page a fine military transport lorry which has recently been completed at the Wolseley works. It is fitted with a 40 b.h.p. horizontal motor having four cylinders in line, each 6in. bore by 7in. stroke. Paraffin is used as fuel, and the Wolseley patent vapouriser is fitted, which, we are informed, enables the motor to be started from cold on the heavy oil. The consumption is approximately 3gal. per hour, and the tanks hold 100gal. Magneto ignition is employed, and the clutch is of the metal to metal type. The change-speed gear gives four speeds forward, of one, two, five, and eight miles per hour, and a reverse of two miles per hour. With a full load the lorry will maintain an average speed of five miles. Two sets of brakes are fitted, both of the metal to metal type, one acting on drums bolted to the chain-wheel sprockets, and the other operating internal shoes which act on the interior of the rear-wheel chain-rings. The front axle is made to oscillate

on a central pivot, which gives the frame a three-point suspension, and enables the vehicle to surmount obstacles without altering its alignment. Either of the front wheels can be driven over an obstacle 1ft. high without affecting the body of the vehicle. The wheels are constructed throughout of steel, the width of the front being 9in., and of the rear 12in. The wheel-base is 11ft. 6in. and the track 7ft., and the weight unloaded is 6 tons. The platform has an area of 80 sq. ft., and a load of 4 tons can be carried.

"The Motor Marines."

Although all the time-expired men of the Royal Marine Artillery who recently went through a course of instruction in motor management and driving have obtained situations at good wages, it appears that only one man in the class showed sufficient driving skill to warrant the grant of a driving certificate by the Automobile Club. It will be remembered that the examiners appointed by the club, Professor Vernon Boys, F.R.S., Mr. Worby Beaumont, and Mr. R. E. Phillips, recently visited Eastney Barracks and put the men through a severe examination, both written and practical, as to their mechanical proficiency, the driving tests being postponed to a later date. Ten men were granted certificates for mechanical proficiency, but the subsequent examinations showed that the men had not yet acquired sufficient experience on the road. This is a matter that will doubtless be easily remedied by their employers, who will, at any rate, have secured servants of exemplary character and undoubted mechanical skill. The fact that the Automobile Club withheld the grant of driving certificates is an indication that a high standard of skill will be required of the recipients of these awards.

30 *B.H.P. MAUDSLAY BROUGHAM-PHAETON.*

The Forthcoming Motor-cycle Road Races.

The second race for the International Auto-Cycle Cup, which takes place on Sunday, June 18th, has become of supreme importance in this country because of the interest which will attach to the preliminary process of selecting the team to represent England. Last autumn, when the first race was run, so little notice was given that the utmost that the Auto-Cycle Club (which is the governing body in England) could do was to agree to send over the three men who offered themselves with machines specially built for the occasion. It was found that the power provided was altogether inadequate as compared with that employed on many of the Continental machines, and for this year's event much higher powers are being employed by the makers. The proposal to again hold the British Selection Trials for the Gordon Bennett race in the Isle of Man having induced the Manx Legislature to enact a measure permitting the Manx Highway Board to grant permission for motor-races on the road, the Auto-Cycle Club has secured the power to run the only motor-cycle race that has so far been legalised in the British Isles. This will take place in the early morning of Tuesday, May 23rd, over a fifty-mile course, and it has been arranged that it shall be a combined race open virtually to all comers, provided their machines weigh no more than 110lb. complete. As used to be the case in the big French car races when the Gordon Bennett contest was run in conjunction with an open race from Paris to some other capital, so in this event the open race will be for the *Motor* Cup and other prizes, whilst those machines which have been specially entered will probably start first, and will also compete for the honour of representing England in the International race. To qualify for the Selection Trials the machines must be constructed wholly and solely in Great Britain. So far the entries number sixteen, and it is to be noted that the amateur owner figures prominently in entering a machine and rider. For instance, Sir A. Conan Doyle has entered a 9 h.p. Roc, to be ridden by T. H. Tessier, whilst Mr. Charles Jarrott has entered a 6 h.p. Jap, the rider to be W. Hodgkinson, who competed in the last contest. The Rev. B. H. Davies has entered an 8 h.p. Westlake, to be ridden by H. P. Maffert. Mr. A. A. Hay, the chairman of the Scottish Cyclists' Union, has entered a machine and rider, whilst Ireland will also be represented by C. B. Franklin on a 6 h.p. Jap. The other entries are two 6 h.p. Matchless machines, to be ridden by the brothers Collier; an 8 h.p. Rignold, to be ridden by H. Rignold, who competed last year; an 8 h.p. Humber (J. F. Crundall); a second 9 h.p. Roc (A. B. White); another 6 h.p. Jap (O. L. Bickford); three 12 h.p. Barrys; and two 10 h.p. Barnes (G. A. Barnes and G. Wilton). Further entries are expected, and altogether there is every promise of a fine race in the Isle of Man. The

RELIABILITY TRIALS.

The best reliability trials are the experiences of customers. Read the following from "The Motor," January 31st, 1905.

POWER OF FOUR-SEATED CAR.

"Sir,—In a recent issue you state, in reply to a query of 'A.L.M.' (Bowden), that 8 h.p. is a very low power for a four-seated car, etc. Last year I purchased a Gamage car fitted with a 6 h.p. De Dion engine and four-seated tonneau. On several occasions I drove it from London to Brighton and back, taking all hills, with three heavy persons and myself on board. On another occasion a motor friend of mine asserted that a 6 h.p. engined car would not take a certain hill used for testing cars. I therefore took the trouble to try mine, and it went up quite easily. It is surprising what these little engines can do.—Yours faithfully, H.H."

A CUSTOMER WRITES:—

"I think my car (a 'Gamage') is the only small car which has run from Hampshire to the North of Scotland without giving trouble. We carried three heavy passengers and 1 cwt. of luggage. I consider the 'Gamage' a wonderful little car."

Genuine 6-h.p. De Dion Engine.

course will be traversed at least four times, so that the trial will be a real test of the qualities of both riders and machines. If England wins the cup this year, she will deserve it, for an effort is being made to secure a large sum for the purpose of defraying all the expenses of the team and the strong bevy of English supporters who will go over and "police" the course for the purpose of rendering any necessary assistance, and in order to check the abuses that told so hardly against our representatives in the last race.

The Tourist Trophy.

The Continental Tyre Company has offered a prize of 100 guineas, or a cup to that value, for the winner of this event, provided that his car is fitted with the firm's tyres. The Tourist Trophy being intended to encourage the production of cars of reasonable horse-power, should tend to make easier the problem that confronts the tyre manufacturers, and enable them to give greater satisfaction to their customers. The entries for the event now number forty, the following cars being the more recent additions to the list: Deasy, Clement, Standard, Gladiator, Renault, Whitlock, Dennis (two), Bristol, Scout, and two Darracqs. It was recently resolved by the committee of the Automobile Club: "That a special award be given to those cars competing in the Tourist Trophy Race which are entirely of British manufacture, the cars to comply with the Gordon Bennett Rules so far as the country of origin is concerned, and the Races Committee to consider to which car or cars such awards should be given."

The 1907 International Sports Exhibition.

A scheme is afoot for the holding of a great international exhibition of sports in Paris next year but one. One of the chief attractions of the show is to be a special automobile track on which motor-cars could race in safety. Naturally the Champ de Mars was regarded as the most suitable site for exhibition and autodrome alike; but against this stands the recorded decision of the Municipal Council in 1902 that the famous plain should not again be used for exhibition purposes. The matter was raised, however, in the Council a few days ago, and strenuous efforts were made to induce that body to depart from its former decision, but in vain. Regarding the Champ de Mars as a military training-ground only, the Council declined, by a large majority, to agree to the building there of an autodrome or the holding of an exhibition at all. It would appear that there is no decided hostility to the project of an exhibition of sports in general, or to an autodrome, provided that a site is found elsewhere; but the Champ de Mars appears now to be out of the question.

The Scottish Automobile Club.

The annual meeting of the western section of the Scottish Automobile Club was held on March 30th, at Glasgow, Mr. John Adam presiding. The annual report and accounts showed the membership to be 303, and a considerable balance in the bank. The chairman, in moving the adoption of the report, referred at length to the work which had engaged the attention of the committee during the past year, and outlined various matters which were having present attention. The Honourable the Lord Provost, Sir John Ure Primrose, Bart., was elected vice-president.

Items.

It is interesting to hear that the flotation of Argyll Motors, Limited, the new company which has been formed to take over the business of the Hozier Engineering Company, has been very successful. The shares have been largely over-subscribed, and many of the applications received were from the trade and from owners of Argyll cars. Arrangements have been made for the early erection of large new works in the vicinity of Glasgow, which will have an output of between 1,500 and 2,000 cars per annum. It is hoped that the 1906 Argylls will be produced at the new factory.

The Mo-Car Syndicate have appointed as their London representative Mr. J. Stenbury, 106, New Bond Street, who will exhibit in his showroom several specimens of the well-known Arrol-Johnston cars

The following recipe for repairing cracked water-jackets is given in the *Horseless Age*: "The cylinder is placed vertically over a zinc basin, the lower water-inlet to the jacket is closed by a cork, and the jacket is filled with a concentrated solution of sulphate of copper through the upper opening. The solution will leak out through the cracks, collecting in the basin, and is poured back into the jacket as it runs out. The leakage will rapidly be reduced to a mere sweating, so that it will be sufficient to pour the liquid back every hour or so, and in the course of a day or two the cracks will be entirely healed."

At the forthcoming motor exhibition at Budapest, which opens on May 7th, the Wolseley Company will show a full range of Wolseley vehicles, and also four motor-boats. These latter include a 30ft. and a 35ft. launch, and a 40ft. racer fitted with a 100 h.p. motor.

AN OLDE HERBE-WOMAN

"LOR, Mum! Th' Almighty puts all as is good for poor folks' stumicks under their werry noses. If so be they'd the right sort of eyes to see wi', they'd know that, an' be less free than they are wi' the chemist's trash." The speaker was a small, wiry old woman, whose cotton sun-bonnet shaded a face full of character and interest. Wisps of grey hair had been blown across it by a March wind. Blue eyes twinkled, shrewd and bright, from hollows dug by time, and the wrinkled cheeks suggested parchment in need of smoothing.

Adminta Brown was widely known in the country-side, where neighbours looked upon her with something akin to reverence, because they had neither lived nor thought long enough to store one tithe of her knowledge. For the results of that knowledge were much to their benefit; and even boys, for whose hands, when idle, Satan is apt to "find some mischief still," did not dare to meddle with the herb-filled flag-basket belonging to the wise woman.

Some seasons, long before February breezes whisper softly in penitence for many dreary months, the advanced guard of spring's army may be seen. There are regiments of green spearheads in sheltered nooks, red buds swell to bursting on willow or hazel, and a few fresh young leaves in the wilderness of last year's greenery tell all who care for the assurance that resurrection time is at hand.

Then Adminta's work began, and nothing escaped her keen eyes, seconded by fingers not unlike birds' claws in their lack of flesh. For practice had taught her, without understanding the reason, that in early spring mankind's vitality is at its lowest; in our veins the life-blood courses slower than at any other time of year. Ailments are in consequence most frequent, and death gathers in a rich harvest among the poor and old. This, no doubt, is why cures are silently, bountifully set ready at that season for the poor to gather by every wayside, on every bank; and in France, so report says, patients are advised by the doctor what to pluck, also how to prepare such simples as may remedy the many small ills which flesh is heir to.

But no doctor thus taught among the wooded hills, where Minty Brown, as friends called her, roved, unhindered and unquestioned, for three-parts of the year. For she was widely known as an authority on simples in general, and so secure was the old woman's footing that she was wont to make flippant remarks on men of healing, her toothless jaws the while stretched in a smile.

"They've got to live," she would say, "and it's right that gentles should be made to pay for them nasty drugs, as no one knows where they come from. It's cheap enough to turn up noses at me, and they're kindly welcome, for *I* goes straight to the Lord's own drug shop."

And what was in Minty's basket from that shop? Amidst the gloom of sodden grass, and shadowed overhead by leafless twigs, she saw a mimic sun which was picked at once. "Only a dandelion," say you. Yes, if you look at it one way, but a sign-post to guide you on the way to health in another, for its uses are many. To the bee that yellow blossom means honey, to peasants in France or Germany its presence insures a supply of leaves for salad, roots to boil for what many have proved to be a valuable medicine in liver troubles, and sometimes its roots are roasted instead for coffee. When dandy is bald, its duty in life is done, and the old herb-woman would pass it by, knowing that there is a time to leave the plant alone as well as to pluck it.

Now there is a scent in the air like mixed May and primrose; yet thorns are bare, flowers are shy, and birds twitter doubtfully about the prudence of building. Search is soon rewarded, for on a marshy bank stands coltsfoot, crowned with creamy tufts which have glints of brown in them. Leaves there are none at present, except folded cushions that shelter the roots and form a footstool for the tall succulent stems. Still, Minty knows that her patients value the fragrant tea which may be brewed from the flowers to cure coughs. Later she will pluck the leaves which Greeks smoked many hundred years ago for asthma, and now when labourers buy a pen'orth of bacca at the village shop, where most things are sold, from bacon to pins, they often lay out their money on coltsfoot leaves, cunningly flavoured and coloured to hide their real nature.

By the end of February, if weather be kind, celandines, countless in number, open their burnished yellow stars to smile up at the sky from every hedgerow. Farmers have not a single good word for the plant, because they think that the acrid roots injure all that grows near them; but Minty Brown is wiser in her generation, and gathers a large supply of the weed.

"Bless 'ee, mum," she would cry, "there aint nought to ekal it for the drapsy and the yaller jaundice, if so be it's sliced aye an' biled, too," she added, not without traces of impatience at our ignorance. And then she went on to tell us in quaint language that, if the plant were pounded into a conserve, with sugar to make it more palatable, it would help the feverish to perspire better than anything.

The farmer is apt to grumble, too, at the golden trumpets beloved by those whose concern is not with poor land, but their reign is never long enough for children who prize daffodils above most flowers. The healing power of the root is great when applied to fresh wounds, so Minty assured us, and according to her it has other virtues which need not here be enlarged on.

A rival in little ones' affection is the wild arum, also known as cuckoo pint, or wake robin, with sometimes a cream, sometimes a crimson, clapper standing bravely up under its pale green canopy to ring in sweet spring at the wind's bidding. Birds, especially thrushes, rejoice in the plant, because they know that, when the north wind blows cold over a nearly desolate world, they may scratch up roots about the size of a nutmeg, where bunches of bright berries prove their presence, and the pungent warmth is grateful, to say nothing of nourishment. The old herb-woman does not pass by wild arum, for she knows from experience that the roots may be sold when properly dried, and London chemists send this forth from their shops to a credulous public under the name of Portland sago. Next on our list is a humble creeper near Mother Earth

which reveals its presence more by aromatic scent than by height or gay colour. Perhaps by reason of its good services to man ground ivy is allowed to flourish nearly all the year round, and the learned in plant-lore say that no cottage should be without dried bunches in readiness for divers ills. Minty will tell you that a few sniffs at it is a certain cure for headache, and that tea made from the freshly-plucked leaves is as good a blood purifier as can be found. Besides these virtues, the plant was cried in the streets centuries ago, to be made into a liquor for coughs, and it has many local names. Dim-eyed ancients with bowed shoulders have a faith equal to Minty's in the merits of boiled centaury blossoms as a tonic, besides its use in low, intermittent fevers; and they say that, if dried for powder, centaury is also good in ague cases or rheumatism. That belated crocus is avoided by cattle, for they do not like the bright, pale lilac flowers of meadow saffron, though our friend in the sun-bonnet gathers it eagerly and digs up the root as well. When sliced, bruised, and mixed with bread she insists upon it that the merits of the root are great as a poultice for sufferers from gout.

A little further on, where the lark rises among moon daisies and quaking grass, Minty spies scabious with its round, purple head, and she knows that close by, where the ground slopes down to a stream, she will find plenty of creamy meadow-sweet. Some say that Satan carried off part of scabious's root one fine day, envying its many virtues, and so it is often called Devil's-bit. But the herb-woman was not likely to trouble her head about names if satisfied that plants were useful by nature. Scabious leaves, when picked young for boiling, before the stalk sprung, were a remedy for asthma; as a syrup they cured coughs, the flowers made a cordial, and the powdered root of the large lilac variety was one of the dame's most favoured nostrums for fever. Meadow-sweet she greatly esteemed for skin troubles; in fact, a chat with Minty when she was in the right humour for one, and at leisure to talk about her hobby, reminded the listener of words which have lived many centuries after their writer: "The wise read Nature as the manuscript of Heaven." And since we are told also to consider the lilies, such things need not be despised as fitted only to please old women, mere toys for children, or food for beasts.

Long ago Minty Brown passed to her well-earned rest, and above the mound in a quiet country churchyard where her body was laid bees hum contentedly when the sun's warm kisses wake them to duty. For thyme grows there, and sweet white flowers, planted by the humble friends who believed in her wisdom, because they felt its benefits in their persons. Surely, then, others may well look down as well as up if they would learn where to find health and happiness through it. For no vain imagination called flowers "stars of earth," nor was it written in an idle moment, "God saw all that He had made, and behold it was very good."

ALL FOOLS' DAY.

THE curious and ancient custom of trying to make fools of people upon the first day of April seems to exist all over the world, and, in common with all the rest of the customs that have come down from time immemorial, there is no explanation of the origin of it, though many have been suggested and often offered. The "sleeveless errands," or fools' errands, upon which people are sent do not seem to have exhibited a great deal of variety. To buy "The History of Eve's Mother" or a pint of pigeon's milk has always been a favourite one. A description of these fooleries was given in Robins's Almanac for 1760, ending up with the very pertinent lines:

> "But 'tis a thing to be disputed
> Which is the greatest fool reputed,
> The man that innocently went,
> Or he that him design'dly sent."

There are occasional allusions in literature to the custom. Goldsmith, in "The Vicar of Wakefield," when describing the manners of the rustics, tells how "they showed their wit on the First of April"; and Shakespeare, who was so well acquainted with every kind of popular custom, legend, and folklore, causes Malvolio, who has been "made a fool" by a letter purporting to have been written by Olivia, to say:

> "Why have you suffered me to be
> Made the most notorious geck and gull
> That e'er invention play'd on?"

And Olivia, upon assuring him the letter was none of her writing, exclaims:

> "Alas, poor fool! How have they baffled thee!"

A feast answering to the First of April seems to have been kept by the Romans. Plutarch observes: "Why do they call the Quirinalia the Feast of Fools? Either because they allowed this day (as Juba tells us) to those who could not ascertain their own tribes, or because they permitted those who had missed the celebration of the Fornacalia in their proper tribes along with the rest of the people, either from business, absence, or ignorance, to hold their festival apart on this day." The festival is also

"LIGHT AND POWER"

A treatise on the application of **ELECTRIC CURRENT** to every phase of **COUNTRY HOUSE** and **ESTATE** requirements.

Price 1/6

SOME PRESS OPINIONS.

The Electrician.—In the numerous illustrations which accompany the text of this handsome book a fine selection of interior views is given of some of the principal houses where artistic electric illumination has been provided to meet many exacting requirements.

The Statist.—The volume should prove of great value to those contemplating the adoption of their own installation of electric light.

Electrical Review.—This book is just the right thing to put into the hands of those who show inclinations towards adopting electricity for large private residences.

The Architect.—The treatise being the outcome of varied experience is worthy of study.

kept in Sweden, in France and Germany, and in Scotland. In the last country the people who are sent upon false errands are called "corbies" or messengers, or April gowks, from *gowk* or *gouk*—a cuckoo, which is always considered a term of contempt. In Scotland there is a custom called "hunting the gowk," that is, sending people upon a fool's errand by means of a letter, which they take from place to place, and upon which is written:

"On the first day of April
Hunt the gowk another mile."

There is a certain grim humour in the action of the Shropshire landowner at the beginning of the last century, who always chose the First of April as the day upon which to close all the gates upon his estate, thus protecting the "right of way."

In France, the person fooled upon the First of April is called Poisson d'Avril, or April Fish, for which strange term the following explanation has been given. The word is said to be a corruption of Passion, and that, as it was at this time of year that our Lord was mocked by the Jews, being sent backwards and forwards from Annas to Caiaphas, from Caiaphas to Pilate, and from Pilate to Herod, the custom of sending people from place to place as a mockery may have arisen from this. It is possible that the primitive Christians, wishing to conciliate the Pagans, and win them to the new religion, adopted their customs and yielded to a conformity of names; but the undiscovered origin of the curious and seemingly meaningless custom of All Fools' Day, in common with the origin of all the other popular and equally apparently meaningless customs, is lost in the vast ages of antiquity, and is, perhaps, more curious and more subtle than anything we can imagine, having—who knows?—even perhaps a basis of some strange lost truth. L. SALMON.

MAGAZINES FOR APRIL.

"THE Economic Value of Woman," in the *Fortnightly Review*, is, on the whole, a sound and fair enquiry. A point the writer brings forward in regard to the opening up for women of professions and increasing employment everywhere, is one not always recognised. A man does not suffer in his development in pursuit of his work. He can have his home life, he can discharge every *rôle* of the social being successfully. A woman is too often stunted in her mental and emotional growth by her severance from domestic ties. It acts on her more keenly and tragically than on the man, for her nature is built to go along certain lines. Deprive her of all chance of house and home, take away her parents and that chance of a natural outlet for her deepest instincts, and at forty her view of life is not quite happy or broadly sane, even supposing her fortunate in her profession. Of course, there are exceptional women, women who are unfit to marry for many reasons, just as there are men, but their number is small. It is the energetic, healthy, wide-minded woman who has had the enthusiasm to follow a profession who will make the best mother. We want the most children from the enlightened part of the race, not from the warrens of the ill-fed and the decadent, whether in high life or low life. In regard to her economic position: "If a woman is mistress of a means of livelihood, she is in a position to maintain a child, provided it were recognised that maternity was merely an interruption of her work and not necessarily a disqualification. Moreover, if anything could check the unfair competition between women and men, it would be the fact that a mother with a child to support could not afford to take the lower and hitherto sufficient wage, which made her a cheaper and therefore a more desirable labourer. The pioneers will have much against them, not least the enormous power and strenuous opposition of the Church, still under the dominion of a period when the upholding of the monogamic ideal was an absolute necessity for the raising of woman's status above chattel slavery. But woman economically independent and treating with man on equal terms, may decide that the mediæval ideal has served its purpose, and must give place to something more fitted for the needs of the newer age. The interests of children she will make her first care; they must be born under healthy conditions, they must be under no social or economic disadvantage; therefore, she herself must see to it that the conditions of her work are not such as to injure herself, and that its remuneration is not hopelessly inadequate."

Mr. George Bourne writes in the *Cornhill Magazine* an article illustrative of the incapacity of the younger labourers in the villages. He gives various conversations of the old men who have toiled for fifty years, which prove that they as well as the employers feel the change of the ways of the new generation. For instance, the old character Bettesworth asserts the unfitness even among carters. "There's a great notion," he grumbles, "o' lookin' after horses, if anybody mind to attend to 'em. They'll tell ye if there's anything the matter with 'em—looking round at ye. They suffers, poor things, same as we do. But a good many o' these on the road—they got to go, whether they be in pain or not. If they flinches, they be whipped up. Them as goes 'long with 'em" (Bettesworth does not even call them carters) "they dunno if they ben't well." One of these same incapables, and he by no means the worst, once owned as much to the writer. "I don't know much about horses," he said, although that is his living. There seems a general complaint about the uselessness of carters, which does not seem to an outsider a very specialised employment. "You can't find now a young man that can do thatching and ploughing and mowing and so on. And look at carters again! Look at these chaps about with the contractors' carts. Their horses show that the men don't know anything—except which side of the road to keep." Once these men and farm labourers took a thorough interest in their horses, and understood how to treat them in their ailments. The older style of labourer seems to agree with the general opinion that is gaining ground, that the inefficiency and indifference of the young are the effect of education, of bad methods of education.

ELLIMAN, SONS & Co., SLOUGH, ENG.

Good Words has a pleasant essay on the fever that spring stirs, the spring fret when the first sunshine of March wakens the dream "over the hills and far away." It is the call of eternal youth that never dies in some hearts:

"Now the Four-way Lodge is opened, now the Hunting winds are loose—
Now the smokes of Spring go up to clear the brain;
Now the young men's hearts are troubled for the whisper of the Trues,
Now the Red Gods make their medicine again! . . . .
He must go—go—go away from here!
On the other side the world he's overdue.
Send your road is clear before you when the old Spring-fret comes o'er you
And the Red Gods call for you!"

Arts and Crafts has a very good and instructive number for April. The president of the Society of Miniaturists, Mr. Praga, gives a demonstration on the painting of miniatures, that most delicate and beautiful art. Reproductions are given of miniatures from the exhibition of the Society of Women Artists. There are some fine spring studies of daffodils.

The *Monthly Review* is an extremely good number, with much less politics than usual. Mr. John Davidson opens it with a pretty poem called "In the City." Mr. Howley writes pleasantly on some of our weaknesses, and Mr. Arthur Symons is learned on Beethoven. George Stewart contributes a really delightful article on the "Popular Songs of Old Canada." A number of those he cites will be familiar to lovers of French literature. Emma Hessey writes a paper called "Quaint Memories"; it is pleasant enough in itself, but we wish she had chosen a title that would not have stereotyped a modern misuse of a fine old word.

Macmillan's Magazine is a very literary number this month, one of the most readable articles being "Ruskin at Hawarden," in the course of which the writer tells the following anecdote: "When the present writer visited Hinksey on a recent occasion, when the landscape was bathed in sunshine, the students' roadway was scarcely discernible. We were somewhat amused on asking a fresh-complexioned villager who lived in a cottage near by, if she remembered the students making the road. She replied that she remembered the time well, and pointed out an adjoining cottage where the students had had afternoon-tea, adding, 'They did not appear to take much interest in the work.' Asked if she remembered Mr. Ruskin, she said she remembered him well, and then added, quite seriously, 'But I hav'n't heard of him for a long while.' When she was informed that he was dead she said, 'Dear me, I never heard of it.' Who will spell fame after an experience like this?" Mr. Dodwell criticises a critic in the person of Matthew Arnold, the judgment at which he arrives being as follows: "He did indeed foresee the promised land of criticism: he even entered upon its farthest borders; but yet we may say that he did this without knowledge. No doubt it was as well; it would have seemed to fall far short of his expectations. And so reconciling the disparate factors which every great critic must reconcile for himself, he exemplified the words which he spoke of his own loved university, telling silently upon the mind of the country, preparing currents of new feeling, keeping up his communications with the future. Matthew Arnold's work was not complete and unassailable; but he has kept up his communications with the future, which will find in him not only the preacher of an ideal of beauty peculiarly noble, lofty, and serene, but the unconscious herald also of a great critical attitude."

Temple Bar has an article by Mr. Salmon on "Hans Christian Andersen," with insight and sympathy, as the following passage will show: "Andersen often seems to have created genuine myths that might rank in early folk-lore; he has the freshness and sincerity of the old myth-makers, with usually a clearer strain of poetry. He leads us to a land where nothing seems absurd or impossible; very often it is pure poetry. There is always a meaning, but it is not tacked on as a moral. In the tale of the 'Snow-man,' we notice how this image, raised by the boys in the garden, gazes with longing love through the window at the genial stove." The number contains many other readable and attractive articles.

PUBLICATIONS RECEIVED.

Letters from Catalonia, by Rowland Thirlmere. Two volumes, illustrated. (Hutchinson and Co., 24s. net.)

The Lure of the Labrador Wild, by Dillon Wallace. "Something hidden. Go and find it. Go and look behind the Ranges." (Hodder and Stoughton, 7s. 6d.)

Arcady in Troy. A treatise on wild flowers in gardens. (The Merrymount Press, Boston.)

L'Avocat Patelin. A fifteenth century comedy in three acts, adapted by the Abbé Brueys and now translated by Samuel F. G. Whitaker. (Fisher Unwin, 3s. 6d. net.)

THE transport of the enormous crowds present at the recent Liverpool Meeting must have entailed a considerable strain upon both the staff and the material of our leading railway companies, the London and North Western, the Great Central, and the Midland; but so perfect is their organisation that not only were the numberless racing specials despatched with the utmost punctuality, but the ordinary traffic was in no way disturbed. On such occasions as these it is only fair that the racing public in particular should acknowledge the manner in which their comfort is studied and their wants anticipated by the officials of these great companies.

- FROM ALL CHEMISTS &c - PRICE 2s 6d and 4s 6d -

"Antipon"

REGD TRADE MARK.

The "Illustrated London News" says "ANTIPON not only absorbs and throws out of the system all superflous adipose matter but increases strength and vitality"

"The Sketch" says "ANTIPON may be warmly recommended to stout persons as much for health's sake as for the attainment of elegance of figure."

PERMANENTLY CURES OBESITY.

THERE is no end to the flow of grateful letters from men and women in all parts of the world who have regained normal proportions by the unfailing aid of "Antipon." Day by day the number is added to, and every letter is most carefully preserved by the "Antipon" Company in proof of genuineness. The newspaper press throughout the entire country has also, by the large number of special articles which have appeared in leading journals, contributed in no small degree to the popularisation of "Antipon," and every issue containing such articles is filed for inspection (if desired) at the offices of the Company.

It is not only as the most successful weight-reducer—indeed, the only really reliable *permanent* remedy for obesity—ever discovered, that "Antipon" has gained such universal favour, but its splendid tonic and strengthening properties have given equal satisfaction. "Antipon," in fact, is now regarded by all competent authorities as the "fortifying cure for corpulence." A course of "Antipon" consistently followed will not only surely bring back the grace, beauty, and elegance the face and figure once possessed, but will greatly increase muscular strength, and restore the nerve strength and brain power which, in the partly debilitated condition due to excessive fat development, are so often deteriorated, as shown in the lack of stamina and staying power which stout persons so frequently deplore. "Antipon" restores vitality—makes one thoroughly "fit" in body and brain.

"Antipon" is the exact opposite of the methods of fat reduction which embraced drugging (mostly with mineral poisons), violent strain by exhausting exercises, and a semi-starvation dietary. There are, unfortunately, still some belated individuals who are undermining their constitutions by such evil practices. "Antipon" requires no help except that of ample nourishing food of good quality. There are no restrictions of an irritating nature. Outdoor exercise by all means, but no exhausting walks. Above all, no drugs! "Antipon" is a treatment in itself. It is a pleasant-tasting liquid, slightly tart, of purely non-mineral ingredients and quite harmless. The course may be followed without the least personal inconvenience or publicity. No one need know that any special treatment has been adopted. "Antipon" is neither laxative nor the reverse, nor has it the slightest disturbing effect upon the stomach, liver, or kidneys.

"Antipon" has a wonderful action upon the digestive organs, in this way; it promotes a keen appetite, and thus calls for increased wholesome food. Food, however, is only real food when properly digested. This work "Antipon" assists by perfecting the digestive process and aiding assimilation and nutrition. Thus the blood is enriched and purified, the circulation improved, and the whole system strengthened and revitalised.

"Antipon" is a very rapid weight-reducer; and it not only destroys the superfluous and diseased fat, internal and subcutaneous, but it does away with the troublesome *tendency* to make, apparently, fatty tissue out of everything eaten. Thus, when a short course of "Antipon" has brought about a return to correct proportions—not merely abdominal, but of the whole body—the doses may be discontinued with impunity. The cure is lasting. Within a day and a night of first dose there is a decrease varying from 8oz. to 3lb. (more in extreme cases), and this is followed by a reliable daily reduction until the bodily conditions as regards weight, shape, and healthfulness are everything that could be wished; the skin pure, the complexion roseate, the limbs nicely moulded and firm, and the whole being glowing with renewed vitality and zest for the pleasant things of life.

"Antipon" may be had of any Chemists, Stores, etc., price 2/6 and 4/6 per bottle; or should any difficulty arise, may be obtained (on sending cash remittance), post free, under private package, direct from the Sole Manufacturers—

THE "ANTIPON" COMPANY, 13, Buckingham Street, Strand, London, W.C.

THE PLEASANT STRENGTHENING CURE FOR CORPULENCE

MODES AND MOODS

I HAVE been wandering in Hatland this last week, and am still gasping with surprise at the effect of some of the most fashionable hats when perched on one's head. Nobody can realise the true meaning of a hat until one has tried it on, and the true meaning of many of the most recent modes is absolute lunacy. They seem to have been created by some incurable inmate of Hanwell, so crazy are they in shape, trimmings, and combinations of colours. It was as good as a play to sit in the room of a fashionable milliner's, and to watch fair English maidens, with indifferently-dressed hair, varying between the neck-bun and the exaggerated circular Pompadour, trying on these aggressively - impertinent hats, which demand imperatively the utmost art of the hairdresser to complete their effect and outlines. The flat, plate-like hats, with hardly the vestige of a crown, tilted forward by an immense bandeau of flowers, 4in. or 5in. high, at the back, with the brim caught up at one side in front with an upright bunch of aggressive quills of different colours, can really have only been devised by a crazy brain. They would extinguish any woman, for no beholder could possibly have eyes for anything below this lunatic headgear; and the outline they give to the head as a whole is grotesque. The colours, too, are often dire, especially in the roses. What has the Queen of Flowers done that she should be libelled by being represented in mud colour, dirty greens, sandy greys, and soiled mauves? These roses look as if they had been thrown out on an ash-heap, and left there for a month exposed to the wind and rain; and these are the flowers chosen for feminine adornment! Ugly in themselves beyond description, they have the additional drawback of being unbecoming; for while there is nothing that heightens the complexion or gives brilliancy to the eyes as the touch of colour given by a true rose (as the Spanish *maja* knows so well), these soiled and wilted flowers of present fashion give no relief of colour at all, and the complexion suffers in consequence. I once met an American who had taken up house-decorating on a new principle, which, as he explained solemnly to me, consisted in painting walls "a dirty colour, so that women should look clean against them by contrast"! I do not think, however, that Englishwomen need to wear dirty brown roses to ensure this result; and they will see how much their complexions will gain if they substitute a rose of Nature's many lovely hues for these ash-heap blossoms. It is their ugliness, however, which offends me, not their lack of truth to Nature, for I am willing to accept contentedly the pale blue roses, which are the latest note of fashion, as they are clean and fresh-looking and undeniably smart. One of the best hats I saw on my tour of inspection was one in the finest black hempen straw (a much prettier kind of straw than the paille-de-riz, and equally light), with a deep brim turned up all round and pinched into a shape something between a tricorne and a Napoleon. A piping of black velvet ran round the brim inside, and a band and bow of velvet encircled the low crown, in the centre of which was a single pale blue rose, from which started a long black ostrich plume that fell over the brim on the left side. A rose, a feather, and a straw shape, that was all; but the result was a triumph for the artist hand that had created it. Another charming little hat was in bronze hempen straw, the brim turned up all round, and caught to the crown at one side in front by a bow of brown velvet; from this sprang a tall group of feathers shading from pale green to brown, the base being a mass of lilac in shades of brown and orange. A second bow of brown velvet was placed at the back, obviating the bald appearance some of these hats have where they meet the hair. This hat had been most successfully copied in black, with a mass of golden pink roses and white

TEA-GOWN IN CHIFFON AND IRISH GUIPURE.

feathers; and it was hard to say which was the smarter of the two.

Though dances are for the moment in abeyance, bridge flourishes like the proverbial green bay tree; and I am, therefore, giving a sketch of a charming bridge costume, which could be worn both in the afternoon and in the evening. The skirt is of pale green chiffon over soft satin, with three gathered flounces, piped at the beading with rouleaux of pale green satin, and caught here and there with soft bows of the same satin. The coat is in pale green taffetas chiffon, cut very long at the back, to which the fronts are sloped away. It is semi-fitting in front, and opens over a low vest of the gathered chiffon, which hardly shows between the high corselet belt of pale green satin and the jabots of fine white tulle. The coat has a narrow border all round of green panne, on which is embroidered a garland of pale pink roses; and the same embroidered panne forms the pointed collar and the turned-back elbow-cuffs, from which fall ruffles of soft white tulle. Green is the colour of Hope; and a woman might, indeed, hope for luck when she sat down to play bridge in so dainty a dress. The illustration I give on the previous page would also do as a bridge frock, but is, perhaps, more aptly described as a tea-coat, for it combines the ease and elegance which we require for the hour sacred to Bohea. The skirt is a pleated one of pale mauve chiffon over satin, intersected with deep vandykes of narrow insertion of Irish guipure. Round the hem is a gathered flounce, with a knotted ribbon of soft mauve satin. The coat, which is the distinctive feature of the dress, is entirely of Irish guipure, an expensive item, perhaps, but unquestionably a good investment and a joy for ever, for these Irish guipure coats wear admirably, and are always in fashion both for day and evening wear. This coat is shaped to the figure at the back and sides, but hangs loose in front, where it is ornamented with four

EASTER EGGS AT MESSRS. HAMLEY'S.

A CHARMING BRIDGE COSTUME

rosettes of violet panne at either side, each rosette being centred with a small diamond button. The under-bodice of mauve chiffon is cut low, leaving the guipure transparent up to the throat, where the smart high neck-band is fastened by two more rosettes of violet panne. The fronts are just held together lightly by a bow of mauve satin ribbon, similar to that on the skirt, with long ends finishing in silk tassels. The sleeves are particularly graceful and appropriate to a garment of this kind. The guipure sleeves are split nearly to the shoulder, and fall apart, showing wide wing sleeves made of kilted flounces of mauve chiffon, to which the guipure is held by two rosettes of violet panne. I have seldom seen so successful and charming a design for a true tea-gown as this one, for it is easy and supremely comfortable without any sacrifice of elegance and beauty, or any falling into theatrical exaggeration, which is often the fault of this kind of garment.

I wrote indignantly on the subject of certain Easter Eggs last week, which were cruelly and inappropriately ornamented with corpses of singing-birds; and it is, therefore, all the pleasanter to describe the wonderful variety of Easter Eggs I have seen at Messrs. Hamley's in Regent Street, where the widest novelty has been attained without any excursion into barbarity. Easter Eggs, of all sizes and for all ages, are to be found at Messrs. Hamley's, from the huge egg for a baby, full of delightfully soft woollen toys, which a baby can neither suck the paint off nor swallow, to the daintiest of hand-painted satin eggs, which contain either chocolate or more expensive gifts, suitable to the more grasping tastes of "grown-ups." The "March-Hare" Eggs are noble and impressive personages who would scorn to be mad, and who solemnly stand in most gentlemanly boots of crocodile leather, their rotund forms clothed in the blue coat and brass buttons of that "fine Old English Gentleman," John Bull. That popular favourite, the "Golliwog" Egg, also holds his own in an infinite variety of sizes, though he is run closely by the "Goblin" Egg, a weird and wicked-looking person with a staff in his hand to support him on his two abnormally slender legs. But whether they look stolid like John Bull, attractively inane like the Golliwog, or wicked like the Goblin, their looks are, indeed, but shell-deep, for their insides are beyond reproach. Toy soldiers, enough to delight the heart of the Kaiser himself; complete sets of tea-things; baby dolls and their trousseaux, with every necessary in life, from a feeding-bottle and a powder-puff to a be-ribboned bonnet; nine-pins and all manner of games; sweets galore, warranted not to contain one tummy-ache in ten pounds; fluffy golden chicks and ducklings surrounding an egg of a relative size as bewildering as that of the Apiornis at the Zoo—these are but a few of the contents which lurk in the deep recesses of Messrs. Hamley's Easter Eggs. A novelty which will certainly cause squeals of delighted surprise in many nurseries on Easter Morn is the colossal egg in an egg-cup. The top is already broken, and a yolk of golden tissue paper is visible, which, in its turn, is to be broken with a huge spoon of silvered cardboard; and then toys of all kinds are ladled out to

The Food Route to Brains

is a sure and pleasant way.

Why should one flounder along with a worn down, fagged out Brain when a simple experiment with food will restore, rebuild, strengthen and nourish that Brain and put it in shape to work hard, make money and do things.

What's the Use

to trifle. Cut out the old time heavy breakfast and try this—

A little fruit,
Two soft boiled eggs, Toast,
A saucer **GRAPE-NUTS** and Cream or Milk, and
A cup of our **Postum Food Coffee.**
(Postum boiled full 15 minutes.)

The Result

will show in a day or two and grow plainer from day to day as the Phosphatic elements specially provided in Grape-Nuts and Postum begin to fill the delicate little cells in brain and nerve centres with grey matter. That means a stronger, sturdier set of brains.

Grape-Nuts

There's a reason.

THE GOLDSMITHS & SILVERSMITHS COMPANY, Ltd.,

112 & 110, Regent Street, London, W.

the willing little hands, whose owners will indeed proclaim this the Egg of eggs. Another most attractive notion of Messrs. Hamley's is the gigantic egg in the front shop, with openings at each side, revealing a quantity of parcels within; and every client who spends more than five shillings can have a "lucky dip" in the egg, the opening at one side being for little boys, and at the other for their small sisters. Such combinations of chance and mystery delight small folk, so it is no wonder that Messrs. Hamley's various establishments, which are to be found at 512, Oxford Street, 64 and 66, Regent Street, 59, Knightsbridge, and 86 and 87, High Holborn, are usually thronged during the weeks before Easter, for nowhere else can such novelties in the way of Easter Eggs be found.

Easter suggests sweets for grown-up people as much as toys for children, and where in London, or indeed in Europe, can such a choice of toothsome delicacies be found as at Messrs. Fuller's Limited? This famous firm has just opened new premises with frontages both in Regent Street and Conduit Street, which certainly form the most palatial "Candy Store," Tea Rooms, and Restaurant in the world. The entrances from both thoroughfares meet in the splendid central hall, where 200 people can be accommodated at a time at the small tables grouped round the white marble fountain, while conversation is promoted by the soft music played in the gallery above the hall, where over 100 more people can be seated and where smoking is permitted. An American Ice Cream Soda Fountain is also installed in the gallery, and the alcoves for *tête-à-tête* parties amid such charming surroundings are likely to be greatly appreciated. The familiar characteristic of all Fuller's establishments, the American Candy Store, is on the ground floor, and those who cannot visit in person the "Home of Sweetness" should write for Messrs. Fuller's beautiful illustrated price list, which can be had on application, and from which purchases can be made by post by simply quoting the number of the particular cakes or bonbons as described in this most ornamental volume.

With the development of feminine intelligence, the glass of milk and a bun as a proper and sufficient form of nourishment has passed away. Women now recognise the importance of sustaining food as a means of keeping their youth and good looks; and it will, therefore, be welcome news to those who shop in the West End, that the International Plasmon Company has opened the "Plasmon Tea-room" in Duke Street, Grosvenor Square, where the weary shopper or picture gallery visitor can obtain all manner of delightful delicacies based on this most nutritious and excellent food. Plasmon tea and cocoa, Plasmon cream and milk, Plasmon scones and toast and rolls and biscuits, Plasmon beef-cup, Plasmon omelette, and Plasmon ices are but a few of the items on the menu, which is as inexpensive as it is varied. Plasmon builds up the tissues in a most remarkable way, as has been proved by the Antarctic explorers and others; and this charming new tea-room will bring its advantages before the public in a practical way, for everyone who has a Plasmon tea at 36, Duke Street, will emerge a refreshed and invigorated being. LAMIA.

LITERARY NOTES.

ONE of the latest so-called gardening books is "My New Zealand Garden," by a "Suffolk Lady" (Elliot Stock). The reason of its appearance is not evident to the serious student of horticulture. We have too many such books. They are simply an outcome of personal vanity, an unfortunate desire to see one's self in print. This would be harmless enough if the books were for private circulation, but they are actually written as serious works by those with the most superficial knowledge of the subject. Who cares for such vapourings as this, page 24: "Sometimes I attribute my love for rake, spade, and hoe to have proceeded from the lack of a good education, which, as compared with my own, most children received, for I was always shaky about the three R's, nor much better read than the old gardener, who could master every word in his book except the long one at the end—Piccadilly." We can well believe it. The illustrations are plentiful and awfully poor. The publishers have done their part creditably, but good printing and a pretty cover do not atone for foolish talk.

The demand for gardening books is apparently inexhaustible, the latest contribution taking the form of two volumes, the result of an issue in monthly parts of *Cassell's Popular Gardening*, edited by W. P. Wright. Simplicity is its chief recommendation, and the small explanatory woodcuts are excellent aids in mastering a knowledge of certain intricate details of plant propagation. There is, however, a want of cohesion in the compiling of the book, a scrappy way of introducing things which have little to do with each other, but a very good index minimises this disadvantage. It is merely a work for the amateur, has no pretence to novelty, and the mass of information is quite as well expressed in standard works. The printing and binding are excellent, and many coloured plates give distinctness to the two volumes, especially the beautiful seedling gladioli which form the frontispiece; the "Star cinerarias" is another well-reproduced coloured illustration. The black and white representations of garden flowers, fruits, and vegetables are very good, and a great point is made of fruit culture, which is an increasing industry in these isles. In spite of obvious defects we can recommend this gardening work to the beginner.

We have received from Messrs. Warne and Co. two books about the flowers of wayside and field. *Wild Flowers* (Step) is a description of the flowers as they open month by month, and will interest the casual observer of Nature's ways. There is nothing scientific in the descriptions, and ample illustrations to make the book instructive. But the most important is the new edition, edited by Mr. Step, of *Pratt's Flowering Plants of Great Britain*, this title embracing the grasses, sedges, and ferns. It is to be issued in monthly parts (2s. 6d. each part), and when finished the volume will have no less than 319 coloured plates, which are so clearly drawn that they constitute a real help in the studying of the British flora. It is partly scientific, but the coloured plates will help those with some knowledge of British wildings. There is a charming description of the common rock rose (page 80). "Anyone used to roam over the chalky or gravelly soils of this country must have often seen, early in spring and late in autumn, the prostrate branches of this rock-rose, covered with their leaves. In spring these are of a tender verdant tint, but late in the year they are rigid, of a dark myrtle colour, and shine with the deepest green hue on the reddened leaf-stems. When the sunshine of July pours down on the grassy slopes, and tinges their sides with its gleams, the clumps of brilliant yellow flowers are bright, as if the sun had turned them to gold. They are truly, as the ancients call them, Beauties of the Sun, or, as some country people term them, 'never opening save when skies are bright, and never lingering on till the late autumnal season.'" We are grateful to the publishers for reissuing this famous work.

Artists are untiring in their protestations that accuracy and fidelity to Nature are incompatible with true art in so far as the delineation of birds is concerned. Such a contention we have always regarded as ridiculous. Proof of this, if proof were needed, and that of the most convincing kind, may be seen in a small collection of studies in water-colour by G. E. Lodge, now on view at the Rembrandt Galleries in London. Whether regarded from the point of view of technique, or from the critical standpoint of the ornithologist, they are genuine masterpieces. Rarely, indeed, has their like been seen even in the metropolis. Mr. Lodge has shown a perfect mastery over the medium in which he works, and a versatility which is astonishing. No more difficult theme could be selected probably than birds in flight, yet some of the gems of this collection are those in which flight is the dominant note. A covey of partridges in full career and a flight of wild ducks in descent will long be remembered by visitors to this gallery as masterly exhibitions of what careful observation and technical skill can achieve. One almost seems to hear the whirring of the wings! No less wonderful are the gulls mobbing a peregrine, and a sea-eagle poised in mid-air on outstretched pinions. Birds of prey, indeed, hold a conspicuous place in this collection, and for grace, dignity, and strength probably nothing like these has been seen since the days of Wolf. Sportsmen will grow enthusiastic over the partridges, grouse, and pheasants which find a place here. One of the most striking of these—partridges clearing a hedge—we have already referred to. Others to be especially studied are ptarmigan in snow—white against white—and partridges in snow, and ptarmigan in summer plumage crouching against lichen-covered rocks. There is a reality about these that is exhilarating; though gazed at in smoky London one seems to be transported for the nonce "back to the land!" They are magical. No less wonderful are the little studies of snipe and woodcock. Perhaps the secret of Mr. Lodge's success is that he is a sportsman as well as an artist. Thus he has acquired a first-hand knowledge of his subjects, so essential, but so wofully lacking in the majority of pictures of bird-life.

The dawn of a new era at the gardens of the Zoological Society will probably awaken a far keener interest on the part of the public in this wonderful collection of animals, in durance, happily no longer, vile. Mr. Beddard, the prosector of the society, has apparently anticipated this, and has prepared a little volume of short essays on some of the more remarkable creatures to be found here, *Natural History in Zoological Gardens* (Constable.) His choice of subject is a judicious one, and his method of treatment should ensure for this book a warm welcome from those who, having had no special training in zoology, are yet interested in this fascinating study. After this little book has had time to make its influence felt, we shall expect to hear quite learned discourses delivered by members of the public, in place, for instance, of the following conversation overheard a few days ago by the writer of this notice. Two ladies standing in front of the pelican enclosure: First Lady: "Oh! look at those *dear* storks!" Second lady: "Why Ethel, they're not storks, they're penguins, a sort of duck!" Beasts, birds, reptiles, frogs, and fishes all find a place in these pages, and all the types selected are of prime importance. The peculiarities of their structure are pointed out, strange traits in their habits are described, and their relations to other types are commented upon. We would suggest that, when the second edition of this work is called for, a more careful revision of the proofs should be made, inasmuch as careless construction of sentences and slovenliness of expressions are more common than should be the case. The illustrations are numerous, and among them are some really pleasing drawings by Winifred Austen.

WARING'S

Most Country Houses have treasured possessions in the shape of Antique Furniture. This has a perennial interest, but the decorations, carpets, and draperies require occasional renewal, and should be chosen with an eye to their suitability to the permanent features. Waring's are specialists in this kind of work; their renovations are characterised by appropriateness and taste; and they judiciously combine new materials with historic Furniture, so as to create an artistic and harmonious ensemble. They are always happy to give suggestions and estimates without charge.

A RAMBLE THROUGH THE PARKS.

SPRING is the most joyous season of the year in the London parks. It comes with a freshness that gives renewed life and energy to the winter-tired Londoner, the tender green of the opening leaf, a thousand daffodils on sunny banks, the music of birds, and fragrance and beauty in grass and border. The complexion of the London parks has changed greatly within the past few years, and spring has its glorious masses of hyacinths, daffodils, tulips, blue scillas, and crocuses, which are more enjoyable than the luxuriant grouping of exotics in the fulness of summer. A walk through Hyde Park shows that the guiding hand in the planting is that of a master, the much-needed clearing away of undergrowth and weeds by the Serpentine banks having the effect of revealing the simple colonies of daffodils and spring flowers, that only show their bright beauty when the gardener is wise enough to copy Nature's handiwork. It is not the mere variety of flowers that pleases, but the way they are planted, and the illustrations accompanying these notes will show the care that is exercised in creating beautiful and interesting pictures. Not many years ago everything was sacrificed to the summer garden of red, blue, and yellow—"bedding out," the expert was pleased to call the fantastic designs in colour which the exotic plant could alone give; but all is different now. Primrose and polyanthus in the most beautiful varieties fill the beds which were formerly left bare, and in May the flaming Gesners tulips open their chalices to the sun.

E. J. Wallis. EARLY-LEAFING THORNS NEAR LANCASTER GATE. Copyright

E. J. Wallis. THE LAST OF THE CROCUSES. Copyright

We are confident that much of this welcome alteration is due to the beautiful gardening that may be seen the year through at Kew, which is regarded nowadays as practically a suburb of the metropolis. At the moment of writing a thousand daffodils bend in the cool winds, the mounds are bright with the last of the crocuses, and bluebells will carpet the grassy ways with colour in May. Much of this is simply the outcome of artificial planting and grouping of spring flowers, and the lesson so well taught at Kew has been heeded by the gardeners in the parks and pleasure grounds throughout the country. The success which attends the planting of spring flowers in the heart of a large city is astonishing. Although the bulbs planted in grass quickly die out, this occurrence is not unusual in private gardens in the country; but town life does not promote healthy growth of any kind compared to the luxuriance that the same things show with purer air and greater sunshine. Still, in the face of difficulties there is nothing but promise for the planters of flowers in the open spaces of sooty London.

The popularity of the flowering tree has given a fresh charm to the London

parks. Groups of almonds in St. James's and other parks are a delight in the late March days when the spreading leafless twigs are veiled in a pink foamy mist. As the days pass by the beautiful crab apples—John Downie, Siberian, and the Japanese Pyrus floribunda—scent the warm spring wind with their myriads of flowers; but this outburst of spring blossom quickly gives place to the natural leaf of early summer.

E. J. Wallis. *DAFFODILS IN NATURAL GROUPS.* Copyright

A pictorially beautiful view is shown of the winter garden in Regent's Park. The Lombardy poplars, tall and straight against the sky, seem in perfect harmony with the surroundings, although we prefer trees of more weeping growth by pool and lake. But this is a happy inspiration, and whether in the grey light of a winter's day or in the drowsy summer-time, we enjoy this association of tree and water. It is a pleasure to know that the superintendents of the London parks have a wholesome dislike to planting conifers or any of the pine family. This was not so years ago, when neither open space nor private garden was considered complete without the introduction of foreign trees of evergreen growth. The conifer is an absolute failure in a smoke-laden atmosphere, and the town gardener should accept this as the experience of many years with but doleful results. It is the crab, thorn, lilac, cherry, and plum that flower in the heart of the metropolis, and in autumn give bountifully of their brilliantly-coloured fruits. A group of the Siberian crab is as beautiful in autumn, when crowded with its scarlet apples, as in the month of May. It is a tree that might well be planted with greater freedom, and the enquiring mind will be wishful for some of the more charming of a race of which there is no small quantity. Where there is so much to rejoice over, it may seem ungracious to criticise. May we ask the responsible gardeners in our beautiful parks whether the tree and shrub pruning that is annually indulged in is necessary to a successful growth? We think not. The mutilation and shearing of shrubs to restrict the growth to certain limits is a blot in our system of park gardening.

E. J. Wallis. *IN REGENT'S PARK.* Copyright

E. J. Wallis. *FLOWERS IN THE GRASS.* Copyright

It is traditional. Our forbears practised this bold surgery, and it is continued by the present generation in the face of repeated condemnation by those who may be accounted competent advisers. The beauty of a tree or shrub consists in the development of its natural growth with judicious help from the pruner, but the cut-as-you-please operations seem to be an annual duty performed with a regularity that would be praiseworthy in any other cause.

But there is more good gardening than bad, and in the springtime of the year the fluttering colonies of daffodils in glade and by water edge, the carpets of scillas, as blue as a summer sky, and groups of flowering trees, make gardens of our parks and pleasure grounds—gardens open to all.

the only palatable Natural Aperient Water.

THE AUTOMOBILE WORLD.

IT is difficult to understand why makers have paid so little attention to the question of interchangeable bodies. In the old days, when people motored purely as an amusement, and generally stopped at home in wet weather, the tonneau, with the occasional addition of a canopy and side curtains, reigned supreme. Nowadays the majority of purchasers are influenced chiefly by considerations of utility, and the carriage-builders have adapted the old landaulette and limousine to meet their requirements. The tendency, however, has always been to try and make one body suit every purpose, and the result at the best is only a poor compromise. The most ingeniously-designed landaulette, with its countless joints and loose parts, and its necessarily heavy method of construction, is far inferior for fine-weather touring to a light tonneau or phaeton, with a cape-cart hood to afford protection in case of emergency. On the other hand, the more suitable the landaulette or limousine is made for fine-weather driving by means of folding screens and collapsible roofs, the less comfortable and convenient does it become, as a rule, for purely town use. Moreover, entirely apart from the question of comfort, it is exceedingly extravagant to use a heavy covered car on occasions when a light open vehicle would serve the purpose equally well. There are the unnecessary wear and tear of a most expensive type of body, the extra consumption of petrol necessitated by the great weight carried, a ruinous depreciation of tyres for the same reason, and a general increase in expense all round.

The man who owns a pair of horses usually keeps at least a couple of carriages for them to draw, but the owner of a £700 or £800 chassis seems content to harness it permanently to one body costing from a sixth to a tenth of that sum. If he can afford two or three cars, no difficulty arises; but where one car, as is usually the case, has to do duty for every purpose, I believe a great opening awaits the maker who will institute a system of easily interchangeable bodies. So far as I am aware, there are no mechanical difficulties in the way, as the majority of chassis are nowadays entirely self-contained, and even where the tanks are fitted beneath the front seat they could be supported from below, and thus made independent of the body. With a little ingenuity the process of exchange could be made very easy, and with the assistance of a simple lifting tackle in the roof of the motor-house twenty minutes at the outside should suffice to exchange the limousine or landaulette for the light open touring body.

The only objection to the scheme is that the chassis itself must necessarily remain somewhat of a compromise between the different uses to which it would be put, as it is obvious that a car intended for a light body is geared higher and sprung more lightly than when it is destined for a heavy brougham or landaulette. It is far preferable, nevertheless, to suffer a compromise in the chassis alone than, as is at present the rule, to endeavour to make one body fulfil every requirement. To have at one's command, at an initial outlay but slightly exceeding a single covered car, a light two-seated machine for long-distance runs, a tonneau with cape hood for family excursions, and a brougham for town work, would prove, in my opinion, a very powerful attraction to a large number of purchasers. I claim no originality for the idea, but merely wish to urge its advantages on the carriage-builders, who, in attempting to design one body for every conceivable purpose, appear to be working on mistaken lines.

THE MONACO MOTOR-BOAT MEETING.
The Mercedes yacht in the Bay.

A case of the greatest interest to motorists was heard last week before the Divisional Court. It was an appeal by the Earl of Craven from a conviction by the Wokingham magistrates for having refused to give the name and address of his driver, against whom the police wished to take proceedings. It is unnecessary to set out the facts in detail here, as I understand that a report of the case will be given in another column. Suffice it to say that the conviction was quashed, on the ground that it did not sufficiently allege that an offence had been committed by the driver. It is a pity that this purely technical defect in the conviction should have prevented a clear ruling by the judges of the High Court as to the meaning of a somewhat ambiguously-worded portion of the Motor-car Act, Section I.

ALLDAYS & ONIONS

LIGHT CAR No. 3.

APPRECIATION.

Dear Sirs, Woking, 4/3/05.

I have much pleasure in now writing to acquaint you that your new Light Car No. 3, with which you supplied me last January, has given me every satisfaction and has proved an unqualified success. You will kindly recollect that having no previous experience of any kind, I have had to learn entirely on this car, and, as at the commencement, therefore, I was merely an average novice, it should be gratifying to you to know that owing to the strength and simplicity of design, it has carried me through the awkward period of learning most successfully, and has proved to possess the great advantage of being fool-proof. As an instance of this my speed change gears, in spite of initial mistakes, which I fear at one time were many, exhibit not a sign of burr or other damage. The style and finish also of the car are most satisfactory and have been much admired. I am very contented with my purchase and it gives me much pleasure to tell you so. Yours faithfully,

Messrs. Alldays & Onions. H. N. R.

THE CRUISER HENRIETTE.

deals, as every motorist knows, with reckless driving, and sub-section (3) makes it an offence for the driver who has driven recklessly to refuse his name and address, and requires the owner to give the necessary information, if requested to do so. It has been argued, however, that this duty of the owner does not arise under the Act *until* the driver himself has refused to give his name and address, and this was the chief point urged against the conviction. The case was decided on other grounds, but the Lord Chief Justice expressed himself in strong disagreement with this particular contention.

Some months ago, when there had been several convictions against motorists for refusing to identify their drivers when charged with reckless driving, I pointed out how mischievous was the construction sought to be placed upon this particular section of the Act. The words are certainly capable of meaning that it is only in the event of the driver refusing his name that the owner can be called upon to identify him; and I believe the majority of the text-book writers have taken this view. A moment's consideration, however, will show that such an interpretation would rob the Act of half its utility as a safeguard to the public, and play into the hands of the motorist who not only drives recklessly, but refuses to stop when called upon. Disguised by a mask, so as to render personal identification impossible, he would be safe from all chance of detection so long as he could avoid an actual demand for his name and address. It would be useless to take the number of the car, as there would be no evidence as to who was driving it at the time. I am, of course, supposing the case of the reckless owner, or the reckless servant shielded by his master or acting under his orders. These, however, are the very people against whom the Act was framed, and it would be a calamity if the restraining influence which it exercises upon their conduct were removed. It is a striking illustration of the careless manner in which the Act was drafted that, except where an offence under Section I. has been committed—and even in this case, as I have said, the language is extremely ambiguous—there is no obligation upon the owner of a car to furnish the name of the driver when a cause of complaint has arisen. The chief argument in favour of numbering was the necessity of being able to identify the motorist who refuses to stop on demand; and this is the very person who has been overlooked by the sapient framers of the Act.

F. P. ARMSTRONG.

MOTOR-BOATS AT MONACO.

[FROM OUR SPECIAL CORRESPONDENT.]

BY commencing in the South of France the motor-boat season starts early, for in the Riviera the first week of April becomes quite possible for races on the sea, whereas such contests would be out of the question in home waters. Under the supervision of the Sporting Club of Monaco, and with the guiding hand of M. Camille Blanc, the proprietor (or one of them) of the gambling tables, the Monaco Exhibition and race-meeting has become one of supreme importance. It is the opportunity for the *début* of the new boats, they are shown in the exhibition grounds out of the water (a most exceptional advantage), the programme of racing is comprehensive and complete, and the management is excellent. What more could therefore be required?

For the exhibition this year 104 boats were entered, of which 52 were cruisers, 39 racers, 3 yachts, and 10 utility craft. There have been, however, no fewer than 43 absentees, the boats which have arrived being 33 cruisers, 19 racers, 2 yachts, and 7 utility craft. The most general reason for absence is inability to get the engine either finished or running, and for some of the blame the recent strikes amongst the iron-founders in France are responsible.

England is not strongly represented, numerically speaking, but in the two Napier boats (the feather-weight and Napier II.), the Brooke boat Baby II., and the Takumono, by Maynard, it is hoped that a prize-winner or two may be found.

The boat with the highest power is the Dubonnet, belonging to the well-known French merchant of that name, her engine being a four-cylinder 400 h.p. Delahaye. But she ran very disappointingly in the trial trips and "tuning-up" operations, which occupied the last three days of last week. The Panhard boats showed up well, as also the English boats. The quality of the construction of the boats shows a great advance on last year, the work being better finished, and the designs being substantially different, particularly in the after sections, where flatness of bottom has not in many cases been considered so indispensable as it was a year ago. But the increase of power of the engine has advanced at a greater rate than has hull strengthening, and as a result of the trial trips against a stiff sea, the Mercédès-Charley had to rush back into port with a strained and leaky bow. Trèfle-à-Quatre has

LORD AND LADY NEWPORT ON A CROSSLEY.

had her engine-power increased from 80 h.p. to 120 h.p. (sometimes called 150 h.p., but there is no reliance on the terms), and after the first run on the sea she came back and was recaulked.

On Sunday morning the first two races were down for settlement, but the result was a lamentable fiasco. Ten boats of the 6½-mètre cruiser class started away for a 43-kilomètre race to Nice and back, the final 10 kilomètres to be round three sides of the pentagonal course laid in the Bay of Monaco. The boats started in fine style, but when they got going the roughness of the sea became very evident, for the boats were pitching into the short waves and getting smothered by the spray.

One after another the boats had to put into different harbours on the coast, the crews in some cases getting back to Monaco by train. A heavy wave swamped La Marguerite and stopped the engine. The boat, being without steerage-way, drifted on the rocks at Cap d'Ail and had her bows wrecked, the crew scrambling ashore. The committee decided to cancel the race, but at about one o'clock it was seen that Joliette III. was coming back around the pentagonal course, and this fact naturally caused the cancellation of the annulment. The owners of the Delahaye VI. and the Lanturlu rushed back to their boats and finished the course, the first-named thus securing second place; while Mr. Miall Green, who had weathered the storm in San Jean, came back at his leisure, to find that he had yet time to get round the rest of the course and gain third prize, beating Lanturlu by 9min., although, had he known the condition of affairs and got away directly the weather moderated, he could have challenged Joliette III. for first place.

An hour after the cruisers had started, that is, at 10.30, the race for the 8-mètre racers was commenced. Six boats came to the mark, four getting away well, La Rapiere, Antionette I., Palaisoto II., and Billancourt. Madrioto and Gobron started after delays. The last-named and Billancourt came back very shortly under their own power, but all the rest were stranded at points of the pentagonal course, and had to be towed in by tugs, torpedo-boats, and dinghys, much damage being sustained all round. Hence the racers' event was annulled, and was announced to be run on Monday; but unfortunately the weather failed to moderate and the second day of the meeting proved even more unfruitful of results than the first, as it was impossible for the boats to leave the harbour.

In Tuesday's racing Napier II. and Napier were first and second respectively out of eight starters in the 40ft. racer class. The winner's time was 2hr. 25min., equivalent to an average speed of 25½ miles an hour. Excelsior VII. was first in the 26.t. cruiser race, and La Rapière (Panhard) had an easy win in the postponed event for the 21ft. racers.

Some Fuel-consumption Tests.

BY the rules of the Tourist Trophy Race the allowance of petrol for each competitor is limited to 1gal. for every 25 miles of "dry average road"—the term "average road" signifying a course similar to the road from London to Oxford *viâ* Uxbridge, High Wycombe, and Stokenchurch. The actual allowance may be more, or less according to the nature of the course chosen and its condition on the day of the race, careful tests being made for the purpose of arriving at the correct quantity. As we have already pointed out, the limitation of fuel has a two-fold object. In the first place, it was desired to restrict the speed and horse-power of the competing cars; and, secondly, the utility of the competition consists in offering an incentive to the manufacturers to improve the efficiency of their engines and transmission gear. Fears have been expressed that the allowance of petrol was too small, and that the cars would be unable to complete the course. That these fears are groundless in the case of well-built medium-powered vehicles, the class of machine which it is desired to encourage, is proved by some preliminary tests which were recently

BROTHERHOOD
. . CAR . .

(20 H.P. 4 CYLINDERS).

"We had an opportunity of trying the new Brotherhood, under the expert control of Mr. Percy Richardson, who has been mainly responsible for its production. The point which struck us most was the excellence of the Carburetter, which allowed of the engine running efficiently at something like 150 revolutions per minute. In fact, Mr. Richardson drove us for miles through traffic without ever taking the clutch out, and at times the pace was a regular crawl. The control is altogether effected by a side movement of the right foot. There could not possibly be an easier way of application or more instantaneous. In fact, taken altogether, the control of this car is perfect. We noticed, too, that it picked up with extraordinary rapidity. At one moment we would be crawling through dense traffic, then an opening would suddenly occur, and a slight movement of the toe would send the car bounding forward like a projectile, only to be pulled up further on, as the traffic closed in, almost as quickly. The way Mr. Richardson handled the car was a liberal education in what can be done with a good motor. In this car the flexibility of the engine was good, while for power it seemed extraordinarily efficient, to judge from the one or two short bursts we were able to indulge in."—*Extract from MOTOR NEWS, March 4th, 1905.*

carried out with an 18 h.p. Napier by Messrs. S. F. Edge, who have entered two cars for the race.

The net result of these experiments, which were conducted on the "average road" between London and Oxford, were as follows: Starting from the 19th milestone from London 1gal. of petrol was placed in a special tank which had been fitted to the car. Twenty-five and three-quarters miles, including the ascent of Dashwood Hill, were covered before the car came to a stop. Filling up with another gallon, a run was made from the 45th milestone to the 52nd milestone just outside Oxford, and back to half a mile past the 35th milestone from London, giving a distance of 24½ miles. Starting again from the 34th milestone with the third gallon, the car ran up to the 30th milestone, and turning back, reached the 7th telegraph-pole short of the 51st milestone, a distance of 24¾ miles. The fourth trial started from the 45th milestone to the 18th milestone out of London, or 27 miles precisely to

A HIGH-POWERED TOURING CAR.

The new 70 h.p. Darracq model.

the gallon. The average of these four runs was 25½ miles to the gallon. A few days later some further tests were made, the car on this occasion carrying the load required by the Trophy rules, namely, two people on board, and 300lb. of ballast in the tonneau. Curiously enough, the results were better than before. With the first gallon the Napier ran from the 19th milestone to ¾ mile past the 43rd milestone, a distance of 24¾ miles. The second attempt gave a total of 26 miles, from the 44th milestone to the 52nd milestone, and back to the 34th milestone. The third run was from the 34th milestone to the 30th milestone, and back to within 100yds. of the 51st milestone, giving just under 25 miles to the gallon. The final run was from the 45th milestone towards London to the 18th milestone, or 27 miles. The average of the 4gal. was 25 11-16 miles. The results of these experiments are instructive, in spite of the fact that Mr. Edge, perhaps wisely, has not made known the exact state of the road or the average speed of the car. The 18 h.p. Napier has a four-cylinder engine of 3½in. bore by 4in. stroke. The latest entries for the Tourist Trophy Race consist of a Dixi car, two Crossleys, and a Minerva. Forty-seven entries in all have been received up to date.

POINTS IN MOTOR LAW.

Two important motor appeals were heard last week before the Lord Chief Justice, Mr. Justice Kennedy, and Mr. Justice Ridley, sitting as a Divisional Court. The appellant in the first case was a motorist named Troughton, who had been convicted of reckless driving under somewhat peculiar circumstances. It appeared from the case stated by the magistrates that the appellant declined to pay a toll demanded for the passage of Sandwich Bridge over the Stour, and backed his car to the side from which he had come. The tollkeeper followed, and placed himself in front of the car, which had then been turned round. The driver warned him to stand clear, and then started the car, whereupon the tollkeeper grasped the near side and was carried 200yds. before he fell off. It was admitted that the speed of the car was only twelve miles an hour, and that no one but the tollkeeper was endangered. The magistrates convicted of reckless driving, "having regard to all the circumstances of the case." The appeal was allowed and the conviction quashed. The Lord Chief Justice, in the course of his judgment, said that the personal grievance between the driver and the tollkeeper was not sufficient to constitute evidence of reckless driving under the Act, and that the Court would be straining the meaning of the section if they held that there had been a criminal offence where there had been no recklessness with regard to anyone on the highway.

In the second case, the Earl of Craven appealed from a conviction by the Wokingham Bench for refusing to give the name and address of his driver, against whom the police wished to take proceedings. The facts of the case, as stated by the magistrates, were as follows: On July 2nd last, Mr. Remnant, M.P., was driving on the Bath Road, and seeing a car approaching, held up his hand for it to stop. No notice was taken of the signal, and the horse shied. The pace of the car was estimated at between thirty and forty miles per hour. The police applied to the Earl of Craven, who was the registered owner of the car, for the name and address of the driver, which was refused. A summons was accordingly taken out under Section I. (3) of the Motor-car Act, which runs as follows: "If the driver of any car who commits an offence under this section refuses to give his name or address, or gives a false name or address, he shall be guilty of an offence under this Act, and it shall be the duty of the owner of the car, if required, to give any information, which it is within his power to give, and which may lead to the identification and apprehension of the driver, and if the owner fails to do so, he also shall be guilty of an offence under this Act." At the hearing the defendant was fined £10 and costs. In the High Court two main points were taken against the conviction. First, that it was bad, as it did not allege that an offence had been committed by the driver; and, second, that it did not allege that the driver had refused to give his name or address, or had

given a false name or address. It was argued that the owner was under no obligation to identify the driver of his car until the driver himself had been asked and refused his name and address.

In giving judgment the Lord Chief Justice said that with reluctance he had come to the conclusion that the conviction could not be supported. He did not agree, however, with the construction which it had been sought to place upon Section I. (3) of the Act. Any such construction would make the section of no effect, as it would leave out of account the case of the driver going off as quickly as possible and giving no opportunity of getting his name and address. The first part of the sub-section, down to the word "Act," was complete in itself, and the remainder created a further offence on the part of a different person. The difficulty, however, was that the conviction did not allege that an offence had been committed by the driver, but merely stated that his name and address had been demanded "in order that proceedings might be taken against him under Section I.," etc. This might merely mean that the name was wanted in order to consider whether proceedings should be taken. It was a well-known rule that, where a conviction contained matters of uncertainty, it could not be supported, and therefore in the present case it must be quashed.

BRITISH *v.* FRENCH CARS.

The French papers, both lay and technical, seem to be seriously disturbed at the headway which the British motor industry is making, and M. Paul Meyan, in answer to a statement recently advertised in *The Times* that a British car (the Siddeley) held the world's record for reliability, has issued a challenge to run his French car against any car of entirely British manufacture in a trial of 5,000 kilomètres with an average daily run of 350 to 400 kilomètres for a stake of 10,000fr. The challenge has been quickly taken up by Mr. Siddeley, who suggests that the arrangements for carrying out the trial be placed in the hands of the Automobile Clubs of France and Great Britain, one-half of the distance to be covered in France and the other half in England. The latter part of the trial would naturally have to be restricted to a shorter distance per day. M. Paul Meyan can hardly object to these conditions, so that an interesting contest seems almost assured.

THE SCOTTISH RELIABILITY TRIAL.

The Scottish Automobile Club (Western Section) has now published a full list of entries for the Reliability Trial, which is to be held from May 10th to May 13th next. The following are the vehicles which will take part:

Class A (petrol vehicles having one cylinder).—8 h.p. De Dion, 10 h.p. Cadillac, 8 h.p. Darracq, and 6 h.p. Wolseley.

Class B (petrol vehicles having two cylinders).—16 h.p. Albion, 12 h.p. Arrol-Johnston, 10—12 h.p. Argyll, 10 h.p. Clément, 12 h.p. De Dion, 10 h.p. Ford, 12 h.p. Darracq, 12 h.p. Wolseley, and 10—12 h.p. Gladiator.

Class C (petrol vehicles having three or more cylinders).—16—20 h.p. Beeston-Humber, 8—10 h.p. Coventry Humber, 18 h.p. Chenard and Walcker, 16 h.p. Gladiator, 12 h.p. Sunbeam, 18 h.p. Siddeley, 20—25 h.p. Ariel, 24—32 h.p. Mors, 14 h.p. Minerva, 12 h.p. Swift, 18—22 h.p. Argyll, 16—20 h.p. Argyll, 30 h.p. Daimler, 16 h.p. Clément, 24 h.p. Germain, 24 h.p. Thornycroft, 18 h.p. Pipe, 16—20 h.p. Richard-Brasier, 15—24 h.p. Ryknield, 20 h.p. Ford, 20—24 h.p. Drummond, 15 h.p. Darracq, 30—40 h.p. Belsize, 15—20 h.p. Brooke, 24—30 h.p. Beaufort, 7—9 h.p. three-cylinder Vauxhall, 30—40 h.p. Martini, 20 h.p. Renault, 12—14 h.p Argyll, and 14—20 h.p. St. Vincent.

SHOOTING NOTES.

REARING WILD DUCKS.

HAND-REARED wild ducks are likely to prove very disappointing unless the shooting on which they are reared has natural features, which incline the birds to lead a wild life later. Anything more ridiculous than the tameness of these birds in places not naturally suited to them can hardly be imagined. They add to the indolence of domestic ducks a cunning peculiarly their own, and nothing will induce them to leave the wretched little ponds where they assemble, or to fly more than a few yards above the ground if they are forcibly evicted. If there are very large reservoirs and lakes where plenty of wild birds drop in all through the year, it is quite another matter. The hand-reared birds join the wild ones and soon adopt their habits, and the same thing sometimes occurs where a river runs through a property. But it would seem that, even so, it is far better to aim at getting up a local stock which breed naturally rather than to swamp the place with hand-reared birds.

LOCAL ATTACHMENT OF WILD DUCKS.

The ideal to aim at is to seek to have a large wild stock of naturally-bred ducks on a property, just as on such of the best and largest estates which are suited naturally to pheasants the ideal is to have a large head of wild-bred birds, from which the stock is annually recruited more and more. Wild ducks, though they could fly away to the North Pole if they pleased, have strong local attachments. It is almost certain that birds bred on a property, artificially or otherwise, tend to stay there to nest the following spring, especially if there is any large piece of water to keep the birds together during the months of February and March. Wild ducks, unlike partridges, are by no means particular where they nest. If the property is well preserved, with the vermin killed down and no prowling dogs about (the greatest enemies to sitting ducks next to foxes), they will nest "all over the place." Hollow trees, straw-stacks, banks, hedge bottoms, woods, orchards with long grass, as well as sedges, river banks, and tussocks are all used indifferently. They will make nests in flower-beds, old sheds, rockeries; in fact, anywhere so long as they are allowed to be quiet. At Tring there are generally a number of pochards' nests on the stones, and under the willow bushes that sprout out below the long plank path which runs out for some 180yds. into the largest reservoir. When ducks once take to nesting in this way on a property, it is not a bad plan to take up all the early eggs, keep them for a fortnight, and then set them. The ducklings can then be reared in the ordinary way. But meantime the duck has made another nest and laid again. By keeping the first eggs back for a fortnight or three weeks, the artificially-hatched ducklings

The

COUNTRY HOUSE ACCUMULATOR.

Users should see that they are supplied with the D.P. Battery, as used at Chatsworth, Eaton Hall, Wynyard Park, etc.

These are of **BRITISH MANUFACTURE THROUGHOUT,** being made at the D.P. Company's Works at Bakewell, Derbyshire.

The

D.P. BATTERY CO., LTD.,

11, Victoria Street, Westminster, London, S.W.

from the first will be about the same age as those of the second brood. When the time comes to turn them out, which can be done earlier than if they were to remain in the rearing field, the old ducks on the lakes and streams will soon annex all the first broods, and bring them up, as they should, to be real wild ducks, and not "poultry."

PRESERVING FRESH-WATER MARSHES.

Nothing pays better to preserve than fresh-water marshes. Preferably they should not be water-meadows, as the flooding of these destroys the plovers' eggs, and interferes with the nesting of wild ducks if the irrigation is at all late. You can get far more shooting at really wild game or fowl on a good marsh than in three times the amount of coverts. Besides this, the number and variety of birds nesting there in spring is a great attraction. In some nine acres of rushy marsh, with a small fresh-water stream, and some springs in it, the following birds were found nesting last April, namely, snipe, redshanks, green plover, sandpiper, woodcock (on a bank at the side), water-rail, coot, moorhen, teal, wild duck, and curlew on the dry side of the boundary wall. In winter woodcock, many snipe, plover, and wildfowl were shot there constantly, and at frequent intervals. If you have a large area of marsh and reclamation, hares and rabbits can be bred in any quantities, and the open nature of the ground makes it extremely easy to keep poachers off. The dry parts produce dozens of plovers' eggs, and a fair stock of partridges can generally be got up. Pheasants always find their way down on to marshes, especially if there are reed-beds there. An excellent addition is made by belts of osiers. They pay expenses and more in three years, and pheasants are very fond of them.

POOLS ON MARSHES.

It is an excellent plan to plant osier screens partly round any favourite pools or "splashes" where ducks like to lie. Care should be taken also to plant the large kind, which grow tall, not the small basket osiers. A few decoy-ducks should be turned out on these pools later in the year, and food in the form of dross barley given regularly. On reclaimed marshes, all the teal, and most of the wild duck, will nest on the bankside by the dykes or streams. Sedges, rushes, reeds, and long grass should be left there, and if the banks are bare, willows should be stuck in, and as they grow "cut over," and sedges scattered round the base. This is most attractive to nesting ducks.

EGG STEALING.

The main form of poaching now carried on is egg stealing. It is done on an enormous scale. No one would believe in the extent to which it flourishes were it not for the numbers of eggs sometimes found or traced to dealers, which eggs are known to have been stolen. The seamy side of shooting appears nowhere so strongly as in the reckless purchase of eggs, especially partridges' eggs, by shooting men, who take no trouble to ascertain whence they come. As a rule, there is a thorough understanding between dishonest keepers and dishonest dealers. Once the connection is established it goes on wherever the keeper may happen to be. But the persons really responsible are the masters of those keepers who leave them without check and without supervision. The collecting of the stolen eggs is done by hawkers. These men have the same confidential relations with labourers as the dishonest keepers have with the dishonest wholesale game egg dealers. They are in the habit of calling at any cottage where fowls' or hens' eggs are for sale, and in so doing excite no suspicion. We doubt much whether even a policeman could search a cart for eggs, though he can search it for game, if the Poaching Prevention Act is in force.

ON THE GREEN.

THE "Golf Stream," as *Punch* called it once with gentle pleasantry, seems this year to have rolled away from the South of France at an earlier date than usual. Commonly people stay there until Easter or after. This year Easter is unusually late, yet people have been going home earlier. Perhaps it is because of the weather, although lately it has shown much improvement; or perhaps it is because of the boys' holidays. In any case, they have gone. At Biarritz, after Captain Maul, the secretary of the Golf Club, had scored a very good and popular win for the chief prize of the year, Mr. Angus Hambro, in a private match, went round twice in the same day in wonderfully good scores. His first round was 66, which is a record for the course. Previously the lowest on record was 67, by Massey, the French professional. In the afternoon Mr. Hambro was round in 69, and these two scores are probably by a good many strokes the best for two consecutive rounds ever played there. In the morning I had the misfortune to be playing with Mr. Hambro, and can testify that the score was made purely by first-class golf. There was not a fluke in it, nor an extra long putt holed. If Mr. Hambro can play at all like this at Prestwick, he will give much trouble to those who aspire to be amateur champion.

With regard to this amateur championship, there seems to be rather an absence of the usual rumours of the coming of American players to take part in it; but, of course, that is not evidence that they will not come. It is to be hoped they may, that Mr. Travis may be of their number, and that we shall not again allow the cup to go sailing across the Atlantic. But if we hear nothing of American men, we hear much of the prospect of American ladies competing for our ladies' championship. Miss Bishop, the present lady champion of the States, is to be here, with Miss Griscom and two Misses Curtis; at least, so rumour says.

The modern tendency of golfers to form themselves into societies is illustrated yet again by the formation of a Cricketers' Golfing Society. Now almost everybody is a cricketer, or has been, and those who never have been always say they have, so that it might appear difficult to draw a distinctive limiting line for this society; but that trouble has been evaded by the rather ingenious scheme of making only those eligible who have been county cricketers, or in their University elevens. Mr. Alfred Lyttelton is president, and Mr. Jessop hon. secretary and treasurer, of the society.

Courses are looking fairly well for the moment, though the growth of spring grass has been delayed very much by the frosts, that seem to have been the rule rather than the exception during the nights of early April. The mildness of the winter has not been altogether in favour of the greens, for it had the effect of letting the cockchafer grubs work up near the surface,

Modern House Decoration.

Hall's Sanitary Washable Distemper

Hall's Distemper is now the popular wall decoration in all good class houses. It is more artistic and cleaner than wall paper or paint, and saves 40 % of the cost of labour.

Hall's Distemper is applied with a whitewash brush and dries with a uniform surface, superior in appearance to flatted paint. It sets hard, is unaffected by heat or damp, does not crack or peel off, and is washable.

It contains no lead, and therefore does not turn black with age. Made in a wide range of 70 colours, which do not change or fade.

Free Sample with particulars from Sissons Brothers & Co., Ltd., Hull.
London Office—
199 B Boro' High Street, S.E.

CAUTION.
See the name **Hall's Distemper** *on all Tins; and refuse inferior imitations.*

BURBERRY-PROOFS

Keep out the wet and are free from condensing heat. They have been tested in every climate and temperature, and everywhere pronounced the best.

BURBERRYS Patent Pivot Sleeve Golfing Jackets (for men and women) give an amazing freedom of arm swing and improve play 25 per cent.

BURBERRYS Slip-on is light to carry, cool to wear, gives ample protection in wet, is a handy and durable spring overcoat and perfect raincoat in one.

Many new models in Travelling, Country, and Sporting Gowns and Headgear, and 1905 Novelties in materials, viz., Rainbow Cloths Gamefeathers, Plus Beau, and Airylight Herringbones are now displayed in Burberrys Ladies' Department.

"The principle of the SLIP-ON is a fine freedom everywhere, which keeps him dry and unfettered during a hard day's work in the rain."
—*The Field.*

"I have had several of your Slip-on coats, and as a country doctor I have found them very successful in every respect, and since using them I have practically discarded all mackintoshes, and have recommended your coats to several of my friends and patients, and they all speak very well of them."

BURBERRYS, 30, 31, HAYMARKET.

SOME PRESS OPINIONS.

THE FIELD.—"We venture to call attention to 'Light and Power,' as from this anyone contemplating the adoption of the electric light may obtain a good idea of what can be done in various circumstances, and judge for themselves as to whether the undoubted advantages of the light would repay them for the cost of installation."

THE ELECTRICIAN.—"In the numerous illustrations which accompany the text of this handsome book a fine selection of interior views is given of some of the principal houses where artistic electric illumination has been provided to meet many exacting requirements."

COUNTRY LIFE.—"The book is full of interesting information, and anyone who contemplates an electrical plant and installation should certainly apply for a copy."

ELECTRICAL TIMES.—"An exceedingly well-arranged and useful volume. Though the reading matter is well written, and of considerable interest, it is the pictures in the book which are likely to bring home to possible users of electricity how effectively that particular form of energy can be used for house lighting and power. The illustrations show drawing rooms, dining rooms, sculpture galleries, and libraries, illuminated by electric lamps; and then the dynamo, motor, engine and turbine, in various useful *rôles*. Fittings and fans, electric heating and cooking apparatus, and electric autocars also find a place in the book."

TRUTH.—"It deals with the electric lighting of Country Houses, supplying heat and ventilation, cooking the dinner, cleaning the silver, blacking the boots, wringing, mangling and ironing clothes, and so on, besides pumping water, sawing wood, clipping horses, shearing sheep, and doing many other things about the house, the stable, and the farm. There seem indeed to be few things that cannot be done by electrical machinery."

and in consequence the rooks have worked down on the cockchafer grubs and excavated holes very ubiquitously. It is a form of annoyance to the greenkeeper that seems to have been on the increase of recent years, and another very considerable annoyance that also seems more frequent than it used to be is provided by the plantain, which spreads its leaves close to the ground, outward from its root as a centre, making cups for the holding of the ball and a general inequality of surface There is a weed-killing apparatus, a hollow spike which lets in a drop of deadly poison to the plantain, that can be used with advantage, but it has to be handled with caution, too, for if more than a single drop be allowed to go out of the tube, or if any of the drops be allowed to fall about on the surrounding grass, the result is a burnt patch melancholy to contemplate. Another way to extirpate the plantain is to enlist a small army of little boys and girls and old women armed with knives, who shall eradicate each plantain singly, by manual labour, and then tread down the holes they have made in the excision. Prevention, however, is far better than cure where the plantain plague is concerned, and the best means of prevention is the encouragement, by a liberal dressing and sowing, of a sound growth of grass and the immediate eradication of any plaintain root that does appear. It is a plague that is by no means confined to inland greens. Many seaside courses are suffering badly from it just now.

HORACE HUTCHINSON.

RACING NOTES.

RACING folks are peculiarly conservative in their habits. They go year after year to the same race-meetings, and, as far as they can do so, use the same trains, travel in the same company, and probably retain the identical room which they have been in the habit of using in their own special hotel; in many cases they and their landlord and the "boots" have grown grey together, their little idiosyncrasies in the way of food and drink are known to the ancient head-waiter, the "boots" knows exactly at what time to order a cab to take them to the course, and by what train they will depart when the Meeting is over. To men of this class regretful memories of the old Northampton meeting must have been plentiful enough some few days ago. There was but scanty comfort to be derived from any of it surroundings, but still one had got into the habit of grumbling and going year by year with unfailing regularity; and, after all, there is no denying the fact that many a rousing finish has been fought out on Northampton race-course, and that many a race-horse of repute flashed past the judge's-box in some of the old-fashioned races which figured on the Northampton card. There was often heavy gambling over the Northamptonshire Stakes, for which many a good horse has been stripped to do battle, including Teddington, who had won the Derby the year before he ran unplaced at Northampton, and Dollar, a son of The Flying Dutchman, who has been of such inestimable service to the breed of race-horses in France. Then there was the Althorp Park Stakes, amongst the winners of which are enrolled the names of such horses as The Bard, La Sagesse, and Rosy Cross, and many a stirring contest has been witnessed when the big fields turned out for Earl Spencer's Plate. Well, these things have been, but will be no more; and the roar of the ring and the thud of the flying hoofs are sounds that are hushed for ever in the bootmakers town.

The racing season proper has barely begun, but yet so fast is it hurrying on that before these lines are in print the Craven Meeting will have come and gone. There are subjects to be considered, however, so vital to the interests of the Turf that no matter how great the rush, or how fast the pace, one must perforce take time to reflect upon them. The one most urgent is undoubtedly the sinister challenge thrown down by the passing of the Street Betting Act in the House of Lords. There is no question of supporting betting, *quâ* betting; everyone has a perfect right to his own opinion, and those who honestly believe that betting is the root of all evil are perfectly entitled to retain their views on the subject- This Bill is a bad measure; it has not even the merit of being honest and straightforward, but is, on the contrary, a most insidious and hypocritical specimen of class legislation of the worst type. There can be but little doubt that underneath the specious pretensions of the Bill there lies a deliberate and crafty intention to strike a deadly blow at racing. The first attack delivered by those who are engineering the present scheme was on betting in race-course enclosures. Finding themselves beaten on that point, they now return to the charge, and apparently wish to legalise the very deed which they formerly endeavoured to render illegal by the provision contained in Section II., which says: "Nothing contained in this Act shall apply to any ground used for the purpose of a race-course for racing with horses or adjacent thereto on the days on which races take place." The object of this "dodge" is patent enough to the most casual observer. It will be noticed that race-goers are to be protected in their betting operations, but that coursing men, rowing men, followers of all branches of sport save racing, are to come under the ban of the savage and inquisitorial provision of the Act. If once the Bill becomes law it follows almost as the night the day that with the added strength which they will have gained by disuniting racing from other sports, the promoters of the Bill will not be long before they once more lead an attack, which this time would probably be only too successful, against the national sport of racing. How such a measure ever came to be read a third time in the House of Lords is a matter which passes all comprehension; the only possible explanation would appear to be that our aristocratic legislators regarded the matter with complete indifference, as being one which neither concerned them nor affected them in any way. It cannot be very long before the Government will have to go to the country, and they may depend upon it that the question of the Street Betting Act will make itself felt at the polls, as the Sporting League, which has Lord Coventry for the senior member of its executive council, has seized upon this very opportune moment for recalling to mind the test questions for candidates for election which were drawn up previous to the election of 1895. These questions cover the whole ground in perfectly clear and temperate language, and can be obtained by anyone desirous of so doing from the hon. secretary, the Sporting League, 46A, Pall Mall. I most sincerely trust that everyone who

Dewar's

The Whisky of MANY Merits.

is interested in any one form of sport will carefully read the various sections of the Street Betting Bill, and that, as far as in them lies, they will leave no stone unturned to defeat a measure which cannot be of any benefit to the class at which it is apparently aimed, and must be of incalculable harm to all branches of British sport.

Speculation on the City and Suburban is engaging considerable attention. The handicap is undoubtedly an able piece of work, and there are in consequence not a few animals which appear to have a fair chance of winning this popular race; but backers would do well to pause and consider the proverb which tells us that "Fools rush in where angels fear to tread." Owners nowadays are very chary of disclosing their hands until the last moment, and it is well to wait and follow the really genuine stable commissions. Nabot's running in last year's Cambridgeshire must not be overlooked, and I happen to know that although in this country there has been a pretty general notion that a mile is the outside distance which he cares to cover, yet in France a different opinion was held about him, and a mile and a-quarter is not improbably his best distance. St. Amant may remember his runaway victory in the Derby, and give us yet another brilliant exhibition in this handicap. Challenger, too, if quite himself, would probably win outright, but he had a very severe illness last year, and it is just possible that in spite of Brewer's care and skill he may not quite have recovered his health and strength. When really well, however, I am not sure that he is not the best colt of his age. The erratic Vedas must always be marked down as dangerous, and Andover is just a likely animal to have improved very considerably during the winter months. Dean Swift ran a good deal better than some folks think in the Cambridgeshire. There will, however, be time later on to return to the discussion of the competitors for this race. The question for the moment is as to whether we can find some horse good enough to take up the gage of battle which M. E. Blanc will throw down for supremacy in the classic events of the year, and unless some hitherto unknown champion is forthcoming the outlook is anything but reassuring. As far as present arrangements are known, Jardy will be the representative of France in the Two Thousand Guineas. At the moment of writing it appears to be only too probable that Cicero will be absent from the field, and that Jardy will repeat his performance in the Middle Park Plate, and score a bloodless victory for M. E. Blanc. Should this prove to be the case, we can, at all events, have the somewhat barren consolation of knowing that both his sire and dam were exported from this country. The easy win of Caius in the Prix des Sablons the week before last must be taken as a warning not only that M. E. Blanc's stable is in form, but that he is in a position to make no mistakes in his trials. There is always the glorious uncertainty of racing to count upon, and it may well be that, after all, the old country will maintain her pride of place in the classic races of the year.

Racing during the past week has been somewhat tame after the excitement of Lincoln and Liverpool, but it was of such an interesting and varied character that if only the weather had not been of the very vilest description racing folks would have had an enjoyable week of quite a picnicky nature. Warwick and Croxton Park were both thoroughly sporting meetings; at Leicester one would have been happy had it not been so cold; and, weather or no weather, there was a cheeriness about the Stock Exchange meeting that would not be denied. The Royal Artillery held high revels at Aldershot, and their Gold Cup was won by Captain C. Hankey, who rode quite a good race on his own horse Beloved, beating Colonel W. H. Derby's Eastern Light by half a length.

At what is, practically speaking, the commencement of the flat-racing season, I can hardly conclude these notes without once more venturing to put in a plea for Lester Reiff. No one knows better than Lord Durham the reasons which led to his suspension and warning off. The warning off has been remitted, but the unfortunate jockey is still prevented from gaining his livelihood. Madden and Rickaby, having duly purged their offence, are readmitted to the full enjoyment of their profession, and, knowing what most of us do know, there is no valid reason why at least a similar clemency should not be extended to Lester Reiff. If in the opinion of his Lordship there is one single element of aught that is not vile in a member of the Sporting Press, I should dearly love to make an appeal as regards this matter to the better judgment of Lord Durham. TRENTON.

EASTER HOLIDAY . . RAILWAY ARRANGEMENTS.

THE various railway companies are catering extensively for the public, as usual, during the coming week. Some particulars are given below, and full details will be promptly forwarded on application to their respective stations and agents.

The splendid programme of excursions arranged by the London and South Western Railway Company for the Easter holidays is well worth the consideration of any in doubt as to the best place to spend an enjoyable time. No difficulty will be experienced in making a selection from the numerous delightful resorts reached by this company on the Sunny South and South-west Coasts. Thanks to the enterprise of the London and South Western Company these charming spots are brought within easy reach of all. Many will be spending Easter on the Continent, for such the company has made ample arrangements. Fourteen-day excursion tickets will be issued from Waterloo to the French Coast for Paris, Normandy, Brittany, etc. The sea passage is only five hours in the most luxuriously fitted vessels in the Channel service. Similar tickets will also be issued to the Channel Islands. Full particulars of the special arrangements for the Easter Holidays are given in the programme, to be obtained at any of the company's London offices and stations, or from Mr. Henry Holmes, superintendent of the line, Waterloo Station, S.E.

The Midland Railway announces, among its Easter holiday arrangements cheap excursions beginning on Tuesday, April 18th, to Ireland.

LAZENBY'S

Extension of week-end tickets.—Cheap week-end tickets will be issued on Thursday, April 20th, as well as on Friday and Saturday, April 21st and 22nd, from London (St. Pancras) to the principal seaside and inland holiday resorts, available for return on any day up to and including Tuesday, April 25th, except day of issue. To prevent inconvenience and crowding, the booking-offices at St. Pancras and Moorgate Street Stations will be open for the issue of tickets all day on Wednesday, Thursday, and Saturday, April 19th, 20th, and 22nd, and tickets to all principal stations on the Midland Railway will also be issued beforehand at any of their City booking-offices. The tickets obtained at these offices will be available from St. Pancras Station, and will be issued at the same fares as charged at that station, and dated to suit the convenience of passengers. They also notify alterations in the ordinary train service during next week.

For visiting Holland and Germany during the Easter holidays the Great Eastern Railway Company's Royal British Mail Hook of Holland route offers exceptional facilities. Passengers leaving London in the evening, and the Northern and Midland Counties in the afternoon, arrive at the chief Dutch cities the following morning. From the Hook of Holland through carriages and restaurant cars run in the North and South German express trains to Cologne, Bale, and Berlin, reaching Cologne at noon, Bale and Berlin in the evening. Special cheap tickets have been arranged by the Harwich-Antwerp route for passengers wishing to visit Brussels, for the Field of Waterloo; also to Liége for the Universal Exhibition.

Special excursion tickets by the South Eastern and Chatham Railway will be issued to Paris, *viâ* Folkestone and Boulogne. Cheap tickets to Brussels by the Calais, Boulogne, and Ostend routes will be issued from April 19th to 24th inclusive, available for eight days. Special cheap eight-day return tickets to Amsterdam, The Hague, and other Dutch towns, *viâ* Queenboro' and Flushing, will be issued from April 19th to 24th inclusive, leaving Victoria and Holborn at 9.25 a.m. Cheap eight-day return tickets to Ostend will be issued from April 19th to 24th inclusive.

The Great Western Railway Company have made complete arrangements for the conveyance in comfort of the holiday passengers travelling at Easter. They have also issued a forty-page pamphlet, giving details of excursions from London to about 500 towns and seaside and inland resorts, for periods varying from half-day and day to fifteen days, at low fares, thus affording countrymen in London an opportunity of visiting their homes at small cost, and Londoners are enabled to take a holiday at some of the most delightful pleasure resorts in the United Kingdom. The pamphlet can be obtained gratis at the company's stations and offices, or post-free from the Enquiry Office, Paddington Station, W.

We notice that the Great Central Railway Company are offering ample and admirable facilities to those desirous of spending Easter at places reached by their comfortable and picturesque route. Excursions are announced from London (Marylebone), Woolwich, Greenwich, and Metropolitan stations to all the principal towns and holiday resorts in the Midlands, North of England, North-east and North-west Coast watering-places, Douglas (Isle of Man), Scotland, and Ireland. The information has been concisely tabulated in the form of an A B C programme, giving the times of starting, fares, dates, and times of return, etc., for any station, alphabetically arranged, which can be easily seen at a glance. Copies of this lucid guide can be obtained free at Marylebone Station, or any of the company's town offices or agencies.

In the shape of an Easter egg, a coloured pictorial announcement, issued by the Great Northern Railway Company, displays a third-class return ticket with the words "King's Cross to Anywhere." A speciality is being made of week-end tickets, which will be issued on Thursday, Good Friday, or Saturday, and available for return up to and including the following Tuesday. The Great Northern Railway, in addition to its frequent ordinary train service to Midland Counties, Yorkshire, North-east England, and Scotland, is running special express excursions to all the large towns on and in connection with its system.

ODDS AND ENDS.

HUNTING-MEN who recognise the obligations they are under to the country-side for their winter's sport, would do well to follow the example of the Atherstone Hunt, who, by collections taken at two of their meets, have subscribed upwards of £40 to the Royal Agricultural Benevolent Institution. If such could be made a universal and annual practice, a very deserving society would be thereby benefited.

—o—

USERS of the cartridge daylight loading system must often have felt the disadvantage of being compelled to expose the whole of the spool of films without being able to shut off the partly-exposed roll in between any two exposures, and, by introducing a focussing screen, see, and also focus, the next subject. Quite a number of inventors have had for their object the attainment of this end, but it can hardly be said that the object has been fully and satisfactorily gained. In the latest pattern Kodak, however, called the No. 4 Screen Focus Kodak, we have an ingenious combination of a glass-plate camera with a roll holder, which, by pressing a spring, swings out of the focal plane and locks in a horizontal position, whilst a ground-glass focussing screen, or a dark slide, or a film-pack adapter is introduced as in an ordinary glass-plate camera; thus focussing each exposure, whether roll film or plates are used, is made easy. The new Kodak is efficiently equipped with "Brilliant" finder, rising, falling, and sliding front, a rapid rectilinear lens, automatic shutter with either trigger or pneumatic release, giving "instantaneous" exposures from 1-100sec. to 1sec. and also "time" and "bulb" exposures. The camera base has a double extension, thus rendering possible the focussing of near objects, such as portraits. Although of such a comprehensive nature, and well finished throughout, the price of the Screen Focus camera is only six guineas for the quarter-plate size.

"Soap deferred maketh the dirt thick."
The Proprietors of WRIGHT'S COAL TAR SOAP offer
£10 IN PRIZES.
A Sovereign will be given to each of the 10 persons sending the BEST EXAMPLE of a PERVERTED PROVERB suitable for advertising a Soap.
EXAMPLE: "Hope deferred maketh the heart sick."
PERVERTED PROVERB: "Soap deferred maketh the dirt thick."
All replies will receive very careful consideration. Any number may be sent, but each one must be attached to the outside wrapper of a Tablet of Wright's Coal Tar Soap. Ladies competing to use a wrapper of the Toilet Soap, and gentlemen a wrapper of the Shaving Soap. Sold everywhere, 4d. per Tablet.
The decision of the Managing Director must be considered final.
Latest date for receiving replies, May 31st.
Address—
Proverb Competition, Wright's Coal Tar Soap,
66 & 68, PARK STREET, SOUTHWARK, S.E.
The result will be advertised in the "Daily Mail" on June 30th.

Benger's Food is sold in Tins by Chemists, &c., everywhere.

WITH the Easter holidays materialised into a happy fact, one's thoughts naturally turn to travelling, and travelling garments will therefore be my opening theme this week. I think the break at Easter is the most welcome in the whole calendar, especially when that feast comes as late as it does this year. The winter months seem so long, the dark days so unending, that one welcomes the renascence of spring as a true resurrection to warmth and sunshine and all that makes life worth living. One loses a great deal of this intensification of delight in breaking the thraldom of winter when Easter is too early; but when it comes, as it does this year, at the end of April, and one can get away to the country knowing one will find the leaves spreading their veil of tender green over the bare skeletons of the trees and hedges, and the fruit trees in blossom, the primroses, violets, and windflowers making a lovely mosaic under foot in the woods, and the birds full-throated with song on all sides, then indeed an Easter holiday is a boon and a blessing to all town dwellers, and indeed to country-folk also. There is no time of year when one longs so imperatively for new garments in which to celebrate the return of spring. The heavy clothes of winter, ingrained with winter smoke and fog, become absolutely offensive, and light-coloured garments are a positive necessity. This wide-spread feeling has been recognised and catered for by those admirable tailors, Messrs. Nicoll and Co. of Regent Street, and what woman starting for a holiday but will be moved to acquire the coat of which I give an illustration? The material is a delightfully coarse cream white serge, the length more than three-quarters, and the coat is lined throughout with cream glacé silk, which makes it delightfully easy to slip on over any dress, whether of cloth or velvet. The fronts, which can be worn turned back or buttoned across, are faced with lines of fancy white silk braid, which has a charming effect; and the natty little turn-over collar is in cherry velvet, which gives a delightful note of colour and smartness to this workmanlike coat. The collar, of course, can be had in the colour the wearer prefers; but the beautiful tone of the cherry velvet against the cream white would be difficult to improve upon. There are all kinds of tempting spring garments at Messrs. Nicoll's; and I was particularly delighted with a dress, which had just been sent over from their Paris house, in pale silver grey cloth. The skirt was a triumph of cut, the only seams being in the middle of the front and back, and the hips being moulded without a wrinkle in the beautiful silky cloth. A stitched band of cloth overlaid the seam down the front and at the back, giving great slimness and height to the figure; round the hem were bias bands of the cloth, with triangular pieces of emerald green velvet braided in silver, and the same trimming reappeared on the smart little bolero and cuffs. All the Paris "tailor-mades" are severely simple in outline now; and the bolero is daily regaining its post as first favourite as against the long-skirted coat, which, though occasionally successful on an exceptional figure, as a rule looks dowdy and unbecoming. The well-cut boleros, on the other hand, suit everyone, be they tall or short, stout or slim; they are now being made cut short at the back and sides, but rather long in front which lengthens the figure very becomingly.

WHITE SERGE COAT

Another dress I saw at Messrs. Nicoll's was ideally smart yet severe. It was in fine navy blue serge, the skirt fitting closely round the hips, but with the seams opening at about the level of the knees, where there was a wide shaped band; and each seam was held together by a double motif of black braid and fat black buttons and cord. The bolero was delightful in its severity; it was cut rather on the lines of an officer's mess-jacket, lined with white satin, and heavily braided both on the outside and on the white satin inside. The fronts could be fastened across with buttons and loops of braid if desired, as a protection to the dainty white moiré waistcoat against dirt and smuts when travelling, but were most effective when rolled back, showing the black braiding on the white satin. The waistcoat was also braided round the edges with fine black braid, and was fastened with round pearl buttons; and it further had a collar of white moiré similarly braided, which turned over the black velvet one of the bolero. Little triangular pieces of black velvet were introduced round the border at the back and sides of the bolero with most dainty effect; and black velvet cuffs bordered with heavy braid adorned the perfectly plain sleeves cut high on the shoulder. For a travelling or morning dress nothing could have been more successful than this beautifully-cut little frock, with its dainty yet unobtrusive detail, which gave it that note of smartness only to be obtained in a first-class house such as Messrs. Nicoll's.

Though tailor-mades are the chief subject for the moment, still the wise woman looks ahead and bethinks herself of certain things she will immediately need as soon as the season begins. One of the most important things to prepare is an ornamental theatre cloak; and I am, therefore, giving a sketch of one which might be manufactured by an intelligent maid during the next fortnight. It is of pale rose chiffon over Liberty satin of a slightly deeper shade, just sufficient to hold its own under the pale chiffon. The skirts of the cloak are decorated with two flounces of chiffon headed by gathered frills of narrow Valenciennes, which are the fashion of the moment, and appear everywhere, on dresses, cloaks, and even hats. Scrolls of the Valenciennes appear above the flounces, caught here and there by a big La France rose with its foliage. The chiffon sleeves are very full, loose, and hanging, and the shoulders are covered by a collar of rich Venetian guipure, divided by narrow bands of sable, which gives a rich note without suggesting heavy warmth. In front the cloak is finished off with loops and floating ends of rose satin ribbon and a huge La France rose. Such a cloak would be a most useful and ornamental one to begin the season with, and its easy fashioning is as great a recommendation as its effectiveness.

No wise woman starts on her travels without her own particular brand of soap. If she is going on the Continent she will find that continental hotels do not think it necessary to provide soap in the bedrooms; and if her travels are confined to England, where broader ideas prevail, she will yet probably find that the soap provided may not be the most delicate for a sensitive skin. Therefore, let the traveller lay in a stock of Pasta Mack Soap, the latest creation of the firm to whom we are all so grateful for having perfumed our baths with those delightful little Pasta Mack Tablets, which are known and appreciated all the world over. The Pasta Mack Soap has the same refreshing perfume as the tablets; it is made of the very finest materials on the latest scientific and hygienic principles. With the Pasta Mack Tablets to soften the water, the soap comes as its natural adjunct and completion, and the combination of the two leaves the skin delightfully refreshed and perfumed. No more charming little Easter gift could be received than one of the dainty little green and gold boxes containing three tablets of Pasta Mack Soap, wrapped in pale green tissue paper, which gives an impression of delicate freshness, that is fully carried out by the soap. The softening properties of the soap and tablets have a most admirable effect on the skin and complexion, and have the same softening effect on sea water as on hard fresh water. As this question of the hardness of the water one may meet with on one's travels is a very important one to every woman who values her complexion, the necessity of Pasta Mack Soap finding a place in every travelling-bag should not be overlooked.

Another item for the toilet which should on no account be forgotten in the feminine traveller's kit is the world-famous Rowland's Macassar Oil. Travelling is not good for the hair; the long hours, the night journeys, the all-pervading dust and grime of railway travelling tarnish one's tresses and give the hair a dead and dried-up appearance. Nothing will counteract this better than the use of Rowland's Macassar Oil, which preserves, beautifies, and nourishes the hair, making it beautifully soft and bright, and keeping it in curl. This admirable adjunct to the toilet closely resembles the natural oil in the skin, so necessary for the nourishment of the hair, without which it becomes dry, thin, and, above all, brittle, the hair breaking under the comb or brush in a most lamentable manner. All this is prevented by the use of Rowland's Macassar Oil, which stimulates the growth and gives the hair a beautiful gloss. The fortunate possessors of fair hair should use the "Golden" form of the oil, which contains the same properties as the red oil, but does not affect the colour of fair or grey hair. While speaking of Rowland's preparations, one should not forget to mention the famous "Pearl" dentifrice, Odonto, which fully deserves its name, for its daily use does indeed make the teeth like pearls.

AN ORNAMENTAL THEATRE CLOAK.

It preserves and beautifies the teeth, strengthens the gums, eradicates tartar, arrests decay, and gives a delightful fragrance to the breath. Rowland's Odonto is an anti-acid, anti-parasitic, and slightly alkaline tooth-powder; and its daily and nightly use will keep the mouth in proper condition, and preserve and beautify the teeth for years. LAMIA.

LITERARY NOTES.

EVERYONE who has once made a practice of including a camera in his kit for a day in the open air, will read with pleasure Mr. Snell's *The Camera in the Fields* (Fisher Unwin). If the author does not tell the beginner anything very new, his advice is sound, and, as the beautiful illustrations show, will help in the achievement of successful work. Mr. Snell evidently has by no means told all he knows in this volume, but in passing it may be noted that he is a firm believer in the efficiency of "pyro," an opinion in which we are inclined to agree with him.

General Sir J. Vaughan's *My Service in the Indian Army—and After* (Constable and Co.) is a record of the life of a hard-working officer, whose period of active service, beginning at Maharajpore in 1843, and lasting down to about 1870, embraced many stirring incidents, including the Mutiny. His name as a successful soldier was won on the Frontier, but he omitted no

MARSHALL & SNELGROVE

NEW SILKS.

TAFFETAS MOUSSELINE, in White, Ivory, Cream, and in 47 colorings, 21½ inches wide, 3/- per yard. This is a beautiful, bright, soft Silk suitable for blouses and young ladies' evening dresses.

TOTTENHAM COURT ROAD,

LONDON.

chance of foreign service, and spent a furlough in charge of a Turkish contingent in the Crimea. Subsequently he was connected with the North Western Railway, under its great chairman Sir Richard Moon, and then as correspondent to *The Times* revisited the scenes of his soldier days, and accompanied Lord Roberts on his famous march to Kandahar. He instances, as proof of this general's extreme solicitude for the feeding of soldiers, his refusal to part with the heavy iron ovens, though they were wringing all the mules' backs, which accordingly were taken right on to Kandahar. Sir J. Vaughan's name will still be a household word in the Frontier force, as the old 5th Punjaub Regiment now bears his name, and he had the compliment paid him of being nominated its first honorary colonel.

Not as on the Indian Frontier, pass by pass, valley by valley, was the great American continent wrested from our hereditary foe, and in Mr. A. G. Bradley's *The Fight with France for North America* (Constable and Co) one is astounded at the comparatively puny struggles between mere handfuls of troops, which resulted in Englishmen winning, first, America for the Anglo-Saxon race, and then the vast territories of Canada for ourselves. The author is not inclined to flatter either the judgment of our Government or the patriotism of many of the Colonies, but he makes an effort to mitigate the impression that most generally prevails as to Braddock's reputation for incompetence, and does full justice to many brave backwoodsmen fighting to a finish against bloodthirsty foes, who killed, mutilated, and rarely spared man, woman, or child in their lust for scalps. It is an admirable book, and one which any student of that period of American history cannot afford to leave unread.

Those who read the letters of a diplomat's wife will know what to expect in Mme. Waddington's new book, *Italian Letters of a Diplomat's Wife* (Smith, Elder). M. Waddington, in 1879, resigned the Premiership of France and went to Rome for a month's rest and recreation. The first part of this book is descriptive of this period; the letters in the second part relate the incidents of a similar sojourn in Rome twenty years later, M. Waddington having died in the meantime. There is much that we would like to quote, but we must confine ourselves to a single characteristic passage relating to a novelist, who once upon a time had a great vogue in England:

"This afternoon we went to have tea with 'Ouida' at her villa outside Florence. She was most anxious W. should come to her—which he agreed to do—though afternoon visits are not much in his line. As we were rather a large party, we went out in detachments, and Madame de Tchiatcheff drove me. We arrived before the Bunsens and W. Ouida came to the gate to meet us, and Madame Tchiatcheff named me. She was civil, but before I had time to say that M. Waddington was coming in another carriage, she looked past me, saying, 'Et Monsieur Waddington—il ne vient donc pas,' with such evident disappointment and utter indifference to the presence of *Madame* Waddington that I was rather taken aback; but I suppose geniuses must not be judged like other people. I was rather disappointed in her appearance. I expected to see her dressed either in 'primrose satin with trails of white lace,' or as an Italian peasant, and she really looked like anyone else—her hair cut short, and a most intelligent face. She was interesting when she talked about Italy and the absolute poverty of the people. She spoke either French or English, both equally well. When the visit had been talked of at home we had told W. he must read, or at any rate look over, one of her books. I didn't think he could undertake one of her long novels, 'Idalia,' for instance, where the heroine wanders for days through wood and dale attired in a white satin dress, and arrives at her destination looking like 'a tall, beautiful, pure lily'; but I think he might like one of her short Italian stories, which are charming, such beautiful descriptions. I always remember one of her sentences, 'There is nothing in the world so beautiful as the smile of Italy to the awakening spring.' One felt that to-day in the garden; every bud was bursting, everything looked green and fresh and young."

A book that may be profitably read along with the above is *Rome*, painted by Alberto Pisa, text by M. A. R. Tuker and Hope Malleson (A. and C. Black). It is one of the handsomest of the many coloured books published by this firm. The artist has not only a good eye for form and colour, but he evidently has also made a study of architecture, and the selection of bits to be shown is admirable. The only fault we can find is that it seems to be impossible for him to paint a house or a palace or even an arch without introducing human figures, which take away from the simplicity and dignity of the architecture. The letterpress is quite worthy of the pictures, and altogether this book is one to be warmly commended.

Quite of a different character is the work on *Nuremberg*, issued by the same firm. The painting is by Arthur G. Bell, and the writing by Mrs. Bell. Here, indeed, we have a contrast with Rome, the quaint, mediæval German houses differing essentially from the stately and dignified architecture of Italy. Mrs. Bell declares that Nuremberg has attained its individual character in spite of modern innovations. "Her electric cars dash past slow-moving country carts of the heavy old-world fashion, familiar to Albrecht Dürer and Hans Sachs, drawn by gentle cows or patient oxen; her numerous factories belch forth black, poisonous smoke, unchecked by the sanitary inspector; ladies, decked out in the height of the latest Parisian fashion, rub shoulders in public vehicles with peasant women wearing short, bright-coloured petticoats, black kerchiefs folded across the breast, and the heavy turban head-dresses introduced at the time of the Crusades. Amongst the soberly-dressed merchants and shopkeepers a group may now and then be seen of the modern representatives of the old Tyrolean huntsmen, in the picturesque short green jackets and waistcoats, breeches ending above the knee, and knitted stockings, leaving the ankles bare, the final touch of mediævalism being supplied by the high, pointed felt or broad-brimmed green velvet hats, finished off with a bunch of cock's feathers."

H. Bell *DAFFODILS IN THE RASH FIELD, RYDAL* Copyright

RACING NOTES.

DEARLY do Irishmen love a good chaser, and right well do they know how to breed and rear the stamp of horse that can stay and go fast over fences of every description. The Liverpool Grand National still holds its pride of place as the premier steeplechase of the world, but Punchestown is undoubtedly the best and cheeriest of all the chasing meetings. The name and fame of it have spread far and wide since the days in the early sixties when the late Marquess of Drogheda devoted himself to the making of the famous Kildare gathering, a task which has been most ably carried on by his successor, Mr. Percy La Touche. The Punchestown fences want plenty of "doing," and at the recent meeting three horses unfortunately met with accidents which put an end to their career, amongst them being Brown Study,

IT is a very interesting fact in connection with the Pianola that it raises the standard of one's musical taste.

We can trace this by comparing the requisitions received from subscribers to the music library. Frequently the Pianola owner starts by selecting Rag times and Popular music; later a Liszt Rhapsodie, or a piece of Moszkowski, or one of Mendelssohn's "Songs without Words" is asked for, until finally the list is composed almost entirely of music of the best class. The truth of the matter is, that many people do not appreciate classical music because they have never had the opportunity of becoming thoroughly acquainted with it. It is, of course, different with those who possess Pianolas, for the world's music becomes known to them.

Although this advertisement deals with the Pianola's educational uses, it must not be supposed that it is the instrument's only charm. It interests and entertains, and as a social factor it is equally valuable. The achievement of the Metrostyle Pianola is not even attempted by any other piano-player. It would interest you. Call!

112 & 110, Regent Street, London, W.

who was the winner of last year's Irish Grand Military. On the opening day Major Horner's Red Ocean, ridden by Captain Higgin, won the Kildare Hunt Cup, the Maiden Plate of 500 sovs. went to Mr. J. Daly's Parire, Major Wormald's Mount Hilary won the Prince of Wales's Plate by four lengths from Mr. H. Beasley's Lively Lad, ridden by his veteran owner, and Captain Stacpoole, who rode the winner of the Grand Military Gold Cup at Sandown Park, added to his laurels by steering Makeaway, the winner of the Irish Military Steeplechase.

To the veteran racegoer there is a peculiar attraction about the meetings at Newmarket, and it is not until we have once more observed the ceremony of saluting the Ditch that we can fully realise that another racing season has commenced. Nature has done so much for the headquarters of the Turf, and the never-failing charm of the glorious expanse of the Heath is so great, that the annoyances of the needless restrictions imposed upon, and irritating tolls demanded from, the public, have been passed by with something amounting almost to indifference, and one had long since ceased to hope for any endeavour on the part of the Newmarket officials to ameliorate matters as far as visitors to the races are concerned. All the greater, therefore, was the pleasure to find, when the Craven Meeting commenced on Tuesday, the 11th inst., that the toll for carriages and motors coming on to the Heath had been abolished. These tolls did not amount to much from a pecuniary point of view, but they were often enough the source of considerable annoyance, and their removal constitutes a move in the right direction. It is also noticeable that a concession has been granted to the poorer class of racegoers by the reduction of the charge for entry to the 5s. ring to 2s. 6d., and it is rumoured that it is possible that a reduction may also be made in the charges for admission to the higher-priced enclosures. With these welcome changes to start with it is to be hoped that light is breaking in upon the darkness, and the suicidal policy of seclusion and disregard of the public convenience and comfort which has hitherto obtained at Newmarket may give place to a freer and more enlightened scheme of management. Owing to the drenching rainfall the going was very heavy, and as evening set in on Monday the promise for the opening day was anything but bright; however, things looked a trifle better in the early morning, and before the work began it had stopped raining, and there were numbers of horses out on the Bury Side; but the heavy state of the gallops rendered fast work very risky, if not impossible, and in the majority of cases steady cantering was the order of the day. Nabot came by with Mr. Lambton's horses, and looked quite well enough to encourage those who have backed him for the City and Suburban, for which, as was stated in these notes last week, he is expected to make a good show. There was but little else of interest to notice, except that on the way back to breakfast I came across one of the most intelligent and best-known of the regular touts, who appeared to have no doubt at all but that Challenger would win the City and Suburban, and it may be that he is not far wrong in his assumption, for I believe that, when really well, this colt was about the best of his year.

The Long Course Plate, which is run over the last mile and a-half of the Cesarewitch course, was the first item on the card of the afternoon's racing, and was easily won by Sir J. Miller's Colonel Wozac, which may be looked upon as a happy omen for the accession to office of his owner as Steward of the Jockey Club in succession to Lord Durham, the retiring Steward. Sweet John was quickly made favourite for the Visitors' Plate, and placed the race to the credit of Lord Dalmeny by administering a two-lengths beating to Melodious, who beat Tom Thumb by half a length for second place. The winner was bred by Mr. J. Gubbins, who let him go for 600 guineas to S. Darling at the sale of his horses last year. "Mr. Jersey's" Liverpool winner, the Leila filly, could not stay home in the Ashley Plate. She cut out the work at a strong pace, but after going a little over four furlongs retired in favour of Merry Moment and Scotch Mistake, who fought out a desperate finish, which resulted in favour of the former by a head. The winner is by Count Schomberg out of Merry Gal, and has a decided likeness to his sire; he is engaged in next year's Derby, and Colonel Hall Walker, his breeder and owner, is to be congratulated upon the possession of a very useful colt. Mr. Leopold de Rothschild is so universally popular that everyone is pleased when his colours are carried first past the post, which Bass Rock did in the Crawfurd Stakes, making the whole of the running, and winning by a length and a-half from Chaucer and Dumbarton Castle. With regard to the interest which has been taken of late in the family of Herod horses, it may be worth while remarking that Bass Rock is sired by Grey Leg, who is a Herod sire.

Not content with training the winner of the Long Course Plate, Blackwell followed up his success by leading in the winner of the Three Year Old Selling Plate and the Fitzwilliam Stakes, the former of which was won by his own filly by Newhaven out of Peace, while the latter fell to Mr. C. S. Newton's Queen Camilla, by Donovan out of Wheatfield. In the absence of Cicero, the Forty-sixth Newmarket Biennial Stakes was deprived of all interest, but an exciting enough race took place, in which Fincastle managed to get home a head in front of Flashlight, with Sir Waldie Griffith's Shilfa third. As far as breeding goes, Shilfa is probably the best-bred horse of his age, and it may be well to notice this fact in connection with the Derby, which it will doubtless be remembered was won in 1898 by the outsider Jeddah, who, on the score of his breeding, and on that alone, was alluded to by an acknowledged expert in breeding and pedigrees as a not improbable winner of the race.

Wednesday morning broke damp and misty, and those who know the Heath are well aware of the dismal effect of such surroundings. Horses flitted by like ghosts, and almost the only matter to notice was the strong exercise given by Morny Cannon to his hack as he cantered from one place to another in the attempt to find St. Emilion, whom he was due to ride in his work. However, he found him at last, and the horse did a couple of nice canters, but they did not help him when it came to racing for the Babraham Plate, which resolved itself into a regular gamble between the supporters of Mark Time, Glenamoy, and Pradella, and in the heavy going weight told its tale as far as Mark Time was concerned, and with Glenamoy either tiring or putting no heart into his work, Pradella, a fine, powerful, lengthy mare, beat him easily by a length, with King's Limner a bad third.

Mr. J. B. Joel had the good luck to win the first two races of the day, the Apprentices' Handicap Plate with Quite Ready, and the Column Produce Stakes with Chestnut, a good-looking and much-improved son of Persimmon and Sweet Story. In both cases jockeyship had not a little to do with the result, the effort of Randall on Chestnut being particularly happy and well-timed. Lord Durham won the Sale Stakes with Orator, and that may be but the prelude to a victory of still greater importance, for this useful colt has only 6st. 10lb. to carry in the Queen's Prize of 1,500 sovs. at Kempton Park. In the Granby Plate the well-named Cythera, by Cyllene out of Stolen Love, just beat the favourite, Crank, by a short head, and brought a very pleasant day's racing to a conclusion.

Much to one's surprise, almost the first horse to come under notice on the following morning was Flower Seller, who was reported to have pulled

up so lame the previous day that he would in all probability never run again. There he was, however, and, moreover, moving well and freely in a useful canter. There was plenty of interesting work going on, and the morning at Newmarket can always be both pleasantly and profitably spent. Not a little gossip was to hand concerning the City and Suburban Handicap, and the consensus of opinion appears to be that Andover or Challenger should win. With one thing and another the time soon passes on these busy mornings, and almost before one realised it the racing, which had been set to begin at half-past twelve, was fairly under way. Mr. Sol. Joel's Imperial II., carrying 9st. 7lb., gave a tremendous exhibition of speed in the Flying Handicap. He is probably the fastest horse in England at the present moment, and is certainly a testimony to the judgment and acumen of Edward Johnson, now training at Upper Lambourn, for it was entirely on his advice that Mr. James Rothschild purchased the horse in France, with a view to winning the Stewards' Cup at Goodwood. Unfortunately for Mr. Rothschild he parted with the horse, who went into Robinson's stable at Foxhill, but was purchased by Mr. Cuthbert Wilkinson, on Johnson's advice, and in his colours won a selling plate at Newmarket with such ease, that Mr. S. B. Joel would not be denied, and outbidding Mr. Cuthbert Wilkinson, became the owner of a horse of astonishing speed; he is, moreover, a beautifully-bred animal by Clarion out of Immortelle. The paddock inspection of the field for the Craven Stakes showed us St. Oswald looking clean and hard, and with evident traces of a regular Kingsclere preparation. He is a nice bay colt, with black points and a white star, and shows plenty of quality, but I cannot help thinking that it was his superior condition alone which enabled him to defeat Shilfa, a splendidly-bred colt by Isinglass out of Merle, who will, if I mistake not, develop into a good race-horse. Shah Jehan does not seem to have grown much during the winter, but Lord Hastings presented all the appearance of a well-trained and well-grown colt. As to the race itself, it needs little description. St. Oswald was always with his field, and when asked to win his race came out and won by a length and a-half from Shilfa, with Lord Hastings third, about a length behind him. Everyone was pleased to hear that the veteran Harry Beasley had won the Conyngham Cup on his own horse, Lively Lad, and many congratulations are sure to be offered to Captain Rasbotham on having ridden the winner of the Scotch Grand National.

Steeplechasing is about done with for the present, but a correspondent, to whom I am often indebted for interesting items, has forwarded me some details of the early days of Moifaa, which others may like to know. He says: "Moifaa was bred by Mr. Alfred Ellingham at Hawke's Bay, and was such an enormous overgrown youngster that he was not broken in until four years old. His extraordinary jumping powers were discovered more or less by accident when his owner rode him as a charger at an encampment of the Mounted Rifles, to which he belonged. During the course of their military training there was some hurdle jumping by sections for a prize, and Moifaa completely spoiled the dressing of his section by jumping clean away from them at every hurdle and completely ruining their chance of winning. Mr. Ellingham then came to the conclusion that he was more likely to shine as a race-horse than as a charger, and had him put into training, where he soon gave proof of his exceptional powers as a steeplechase horse, and was ultimately purchased by Mr. Gollan for £1,000." The rest of his story we know. TRENTON.

Hall's Sanitary Washable Distemper

Perfection in Distemper

is attained in Hall's Sanitary Washable Distemper, because it is unaffected by light, heat or damp; is washable, does not crack or peel off, and retains its true colour.

Hall's Distemper is the up-to-date wall decoration. It is pleasing to the eye and insures cleanliness. It is, when first applied, a thorough disinfectant and germ destroyer, and appeals alike to the artistic and practical side of house decoration.

The material is sold in tins and iron kegs and only requires water adding to be ready for use. It is of greatest utility for Estates, Farms, Agricultural Buildings, Out-houses, and for most purposes where oil paint is usually applied.

CAUTION.—See name Hall's Distemper on all packages and refuse inferior substitutes.

Sample, shade card and full particulars from Sissons Brothers & Co., Ltd., Hull.

London Office—199B, Boro' High St. S.E.

Hall's Sanitary Distemper is made in two qualities for inside and outside work.

THE MONACO MOTOR-BOAT MEETING.

[From Our Special Correspondent.]

As was briefly related last week, the motor-boat contests at Monaco started most inauspiciously, owing to the sudden change in the weather. There had been a hot sun and a calm sea during the course of the exhibition, but when the Thursday (April 6th) arrived, and the boats were to embark upon their three-days' testing and tuning-up, the wind rose, and few boats were able to get out until the Saturday, when there was a lull and the conditions were almost tropical. Panama hats, light and scanty clothing, and the grumbles of the corpulent proclaimed the oppressiveness of the heat. On Sunday morning, however, the weather-wise should have known that the weather was not so settled as, to the uninitiated, seemed to be the case. Certainly the organising officials gave no thought to the matter, and it was only after the gun had fired for the 8-mètre racing class, and the competing boats had attempted to round the first mark-boat, that the roughness of the broken water became obvious to those perched up on the terraces, whence the aspect of the sea was naturally misleading. The cruiser class, which had started an hour earlier, had sought shelter, one boat only, Joliette III., braving the elements, her skipper, M. Sébille, being an experienced yachtsman, having immense advantages over at least some of the other helmsmen in the race. Mr. Miall Green, the owner of the Takumono, is also an old yachting man, and he could have got through, but for the fact that the hood over the forward part of the boat was so badly made that it allowed water to enter at every wave. The annulment of the race was one of those hasty, ill-considered acts so characteristic of the French sports promoter, because it should have been obvious to the meanest comprehension that were even only a single boat continuing the race, and complying with the conditions, the race was in progress, and the first prize could be claimed. So when Joliette III. came in, and proved that she had carried out the programme, there was need for more hurried annulments of previous decisions. It was satisfactory to note that the only English boat in the race completed the course. But for the advice that the race was off, she could have done better than third place. The wreck of La Marguerite (which must have been pounded to pieces in the gale of the next day) was an instance of bad management. She had no anchor on board, and so could not be saved from drifting on to the rocks. (The officials next day began to examine the boats to see that the necessary anchor, lifebuoys, and fire-extinguishers were on board!) Moreover, had her captain been a yachtsman he would have passed the Cap d'Ail farther out to sea.

The racers, as we recorded last week, came back mostly in tow, for directly they rounded the south-western buoy of the pentagonal course and faced east, the full brunt of the gale was experienced, and one after another their "fires were put out," water swamping plugs, wiring, and carburettors, and laughing at the vulnerability of the petrol motor with unprotected vitals. Le Gobron had her bow stove in by collision with another boat at the very start, and, but for a liberal plugging with grease, must have sunk. The weather moderated in the afternoon, and on Monday morning at 8.30 the sea was dead calm, with an overcast sky. At nine o'clock there was an easterly gale raging, and the sea was lashed into wild confusion. Even the moorings in the harbour became unsafe, and the boats were run over to the shelter of the mole, where the only discomforts were the howling wind which swept round the headland and the clouds of spray which were carried across the wall. These conditions continued until late in the day, and then rain fell, and beat down the angry sea to a lake-like surface again; and on Tuesday morning the sea was once again safe for small craft. The bare results of Tuesday's racing were included in my first article, but the day's programme was so important that it calls for a detailed description. The first event was for cruisers having a length between 6½ mètres and 8 mètres. They had a journey of 52 kilomètres, having to go to Nice, thence back to Mentone, thence returning to Monaco, going round part of the racing course from Cap Martin to the finishing point. Nine boats started, Excelsior VII. being third over the line, but, travelling at a faster pace, was soon in front. She was into Nice in 41min., Nogentais being 7min. behind her, and the rest spread-eagled. At Menton, Excelsior VII. was 14min. ahead and at the finish 17min. was her lead, her time being 2hr. 10min. 51sec. She was built by Celle and engined by Picker Moccand. Nogentais finished second, 17min. afterwards, with Bigort-

Delahaye 4min. behind. All finished except the Gardner-Serpollet boat, slowest of all on the outward journey, and unlucky in smashing her propeller on the return.

The great event, one of the most important of the whole Monaco programme, was that for racers of from 8 mètres to 12 mètres in length (40ft. boats being included). This class gains its importance from the fact that the 40ft. limit is almost universal, and that size of boat has been generally built and studied, the larger boats being more of an experimental nature. Napier is the light feather-weight designed and built by Saunders on his sewn form of construction, and engined with the motor from Napier Minor. Lord Howard de Walden bought her from Mr. Edge just before the race for £1,500. Napier II. is the crack Yarrow-Napier boat with two 75 h.p. engines and twin screws. Legru-Hotchkiss was designed by Linton Hope, and built under Saunders's supervision in Paris. Her engine is a 100 h.p. Hotchkiss. Palaisoto I. and La Turquoise are Tellier boats, the former with a six-cylinder Panhard engine, and the latter with an eight-cylinder light Antoinette motor. Mme. du Gast, the owner of La Turquoise, steered her in the race. Baby II. is the little Brooke boat, only 30ft. long, with a 70 h.p. engine, but she is a cruiser pure and simple, and was quite out of her class amongst the others. C.G.V. was designed by J. A. Smith, and built in Paris, her engines being by Charron, Girardot, and Voigt. Mercédès-Charley is a Pitre boat of beautiful lines, and has two 90 h.p. Mercédès engines placed in tandem. They never worked well, but instead strained the hull considerably. Trèfle-à-Quatre was the only non-starter in this race, her new 120 h.p. Richard Brasier engines having rendered her very leaky. At the start Mercédès-Charley went off with a rush, and did two laps of the 12½ mètre course in 15min. 21sec. and 15min. 41sec., and then tore away into harbour as quickly as she could, a defect in the lubrication being announced as the trouble. Napier II. now came to the front, and did a lap in 16min. 28sec., and thence led throughout the whole of the eight laps (100 kilomètres, or 62 miles), her winning time being 2hr. 25min. 54sec. Napier travelled splendidly, making no fuss through the water, and scored second place in 2hr. 46min. 18sec. C.G.V. was slow over the first round, but gradually improved, and finished third in 3hr. 20min. 28sec. Legru-Hotchkiss had trouble for five laps, and then did three laps in 64min., gaining fourth place, an hour behind C.G.V. Baby II. had one stop, due to a heated propeller-shaft bearing, but otherwise averaged 30min. per lap, and finished fifth. The other boats broke down, and it will be observed that all the boats which finished were wholly or partly English. The time of Napier II. is a new record for 100 kilomètres, Trèfle-à-Quatre having previously held it in 2hr. 30min. 50 1-5sec.

Mercédès top speed had been 48 kilomètres 920 mètres (30·3 miles) per hour, whilst Napier II. averaged 44 kilomètres (27·3 miles) per hour over the first half of her journey and 41 kilomètres 140 mètres (25½ miles) over the whole 62 miles. All these figures constitute world's records.

The 6½ mètre to 8 mètre racing class contested the race postponed from Sunday, four boats turning out—La Rapière (Panhard-Tellier), Billancourt (Renault-Pitre), Antoinette II. (Antoinette-Tellier), and Palaisoto II. (Renault-Tellier). La Rapière was much the fastest boat, doing a lap in 17min. 56sec. (only 1½min. longer than Napier II.'s best). She led all the way, challenged by Antoinette II. during the first lap, and won in 2hr. 26min. 30sec., or only 36sec. longer than Napier II. for the 100 kilomètres. So when these two boats meet in the championship race it will be a struggle. Billancourt stepped into second place in the third round, and finished in 2hr. 46min. 20sec. Antoinette II. was third, 1min. 14sec. later, whilst Palaisoto II. brought up the rear in 2hr. 53min. 52sec.

From Tuesday the weather remained fine enough for the racing, which was continued without interruption. The hollow success of the British craft had put the French builders on their mettle, and every nerve was now strained to get the crack boats ready, the Championship of the Sea, to be contested on the Friday, being the event the winning of which was worthy the necessary effort.

On Wednesday the 100 kilomètre race for the 18 mètre boats took place, and owing to an injury to the hull of Panhard Levassor, she had perforce to run for the harbour just before gun-fire, so that the race resolved itself into a match between the Pi-Ouit IV. (100 h.p Turcat-Mèry engine) and Dubonnet (400 h.p. Delahaye engine). Pi-Ouit is a last year's boat, and though she started more slowly (25min. for the first lap of 12½ kilomètres), she maintained an average speed of about 31½ kilomètres per hour. Dubonnet, however, made most in and out running, and only averaged 26½ kilomètres per hour, and was beaten by over 37min. Fiat X. won the race for 40-ft. cruisers, over a course from Monaco to Nice and Antibes, then back to Monaco, on to Mentone, and finally returning to Monaco. She was gaining all the way, and her speed equalled 32½ kilomètres per hour—exceedingly good.

Thursday witnessed the victory of Dietrich II. in the class for 60ft. cruisers over a 140 kilomètre course, the Mercédès C.P. being 40min. behind the other boat, the time for which was 4hr. 41min. 25sec. The speed of Dietrich II. was nearly 30 kilomètres per hour. The fishing-boat race was most interesting, Henriette winning over a 74 kilomètre course at 12¾ kilomètres per hour—a goodly pace indeed for a fishing craft. Dalifol, a 20ft. boat, won the event for utility craft, her speed exceeding 14 kilomètres per hour. Thursday was rendered notable by the virtual destruction of the famous Trèfle-à-Quatre, the winner of many events last year. Her new engines have given trouble, being difficult to start, and imposing a strain on the old hull. During the attempt to start for a trial trip on Thursday morning, a small quantity of petrol got into the well under the engine, and after the boat had travelled 100yds. from her moorings a back fire through the carburettor ignited the vapour and drove Mr. Thubron, her owner, and Mr. J. B. Evans, who was acting as engineer, on to the stern deck. All efforts to quench the flames failing, the boat was towed into shallow water and scuttled. She was raised later on, and although her engines are not materially damaged, the hull is useless for further work. Everyone regrets the accident, for Mr. Thubron is a sportsman, and the old boat had deserved a better end.

On Friday the Championship of the Sea was contested over a course of 200 kilomètres, the event being open to all comers, so that 8 mètre motor-boats were mixed up with big 15 mètre craft. Dubonnet had the biggest engine-power, a 400 h.p. four-cylinder Delahaye engine driving a single screw. Panhard Levassor had two 100 h.p. Panhard engines placed tandemwise, and driving one screw. Mercédès-Charley's two 90 h.p. Mercédès engines were similarly disposed. Pi-Ouit IV. had two 100 h.p. Turcat-Mèry engines with twin screws, and she was the only French boat with more than one screw, as Napier II., with two 60 h.p. Napier engines, was the only English boat with twin screws. La Turquoise and Antoinette II. each had eight-cylindered Antoinette engines of 120 h.p., C.G.V. had an eight-cylindered C.G.V. motor, Legru-Hotchkiss a 100 h.p. Hotchkiss, Le Gobron a 100 h.p. Gobron-Brillié, Palaisoto II., Billancourt, and Madrioto each an 80 h.p. Renault, La Rapière a 100 h.p. Panhard, Napier a 50 h.p. Napier, and Baby II. a 35 h.p. Brooke. La Rapière (the old La Rapée III. with more powerful engines) got the lead at the start, but soon lost it to Mercédès, Panhard and Dubonnet following. Napier II. had had her hull strained in the process of launching, and, although she was travelling well, it was found unsafe to proceed, and as she had been lapped by the leading boats, she withdrew from the contest. The other English boat (Napier) suffered a derangement of her engine when three-quarters of the way through the race, and also retired. Baby II. was, of course, not speedy enough for such a contest. So England's hopes became dashed to the ground. Mercédès was the fastest boat, but not the most reliable, and eventually Panhard Levassor, driven by M. Tellier fils, won in 4hr. 22min. 54sec., which established a new record. Napier II.'s record for half the distance was 2hr. 25min. 54sec., so that Panhard's time compared splendidly. The second boat was La Rapière, a Tellier-built boat, as was Panhard, and also Palaisoto II., which finished third; Madrioto was fourth. Têtu, a 50 h.p. Delahaye-Tellier boat, was first of the cruisers, running with wonderful regularity, and finishing in 6hr. 4min. 57sec., equivalent to nearly 33 kilomètres an hour.

Saturday was devoted to the handicap contests for racers over a 50 kilomètre course, and for cruisers over the course from Monaco to Nice and back. The first event provided another of those sensational incidents with which the meeting was crowded, and which almost threatened to result in the extinction of the racing fleet. Panhard Levassor was well out to sea on her first round, when she suddenly disappeared from view. The hard-fought race of the previous day had evidently placed too severe a strain on her flimsy hull, and without a second's warning her bow planking collapsed, and the champion of the meeting sank head foremost like a stone. Her crew of three were saved, thanks to the cork jackets which they were wearing. The accident caused intense excitement on shore, and the race was promptly declared off.

The Automobile Club and Driving Certificates.

THE regulations for the granting of driving certificates have now been issued by the Automobile Club. The object in undertaking this work is fourfold. In the first place, it is hoped to create public confidence in the proficiency of motor-car drivers; secondly, to stop the growing evil of interested persons issuing certificates which, as a rule, convey no assurance of the skill of the recipient; thirdly, to secure the recognition in foreign countries of the club certificates, so as to avoid the necessity of a further examination when touring abroad; and fourthly, to assist qualified men of good character to obtain employment as drivers. The club is already recognised by the War Office as the proper body to examine recruits for the Motor Volunteers, and it has recently been applied to by the President of the Royal Marine Artillery Technical Instruction Committee at Portsmouth, to examine the time-expired men who recently went through a course of motor instruction. The rules have been carefully drawn up, and it is clear that a high standard of proficiency

will be required of the recipients of the club certificates. Two classes of certificates will be issued, one for private owners, and the other for paid drivers. The latter will be granted for one year only, but will be renewable at the discretion of the club for like periods without re-examination. All certificates are liable to suspension or revocation, and the club reserves the right to notify publicly the fact that any certificate has been suspended or revoked. Certificates will only relate to the driving of the particular type of car or cars in which the applicant has been examined, *i.e.*, steam, petrol, or electric, which will be mentioned on the certificate, together with, *inter alia*, the full name and address of the holder, and the date of issue and expiry. A photograph of the holder will be attached to the certificate. Certificates may be suspended or revoked if the holder is guilty of inconsiderate driving, drunkenness, or other misconduct, or of any misbehaviour or unfair practice in connection with automobilism. The fee for a certificate is £1 0s. 6d. in the case of a private owner, and 15s. 6d. for a paid driver. These sums are increased to £1 10s. and £1 5s. respectively if the examination is carried out on the car belonging to the club.

W. A. Rouch. *CARS AT PUNCHESTOWN RACES.* Copyright

In addition to driving certificates the club will also issue life certificates of mechanical proficiency. These will be of four grades, namely, special, first, second, and third class. To illustrate the standard of skill required by the club we may take the case of the First Class Certificate, which, in the words of the rules, will be granted "to applicants who have had at least three years' experience in general engineering or automobile works, of which one year must have been in a motor-car constructing or repairing works, and shall pass an examination on the construction, working management, and care of cars. Three years' experience in charge of a car in private service may be taken as equivalent to one year in a motor-car constructing or repairing firm." The fee for each examination is £1.

THE AUVERGNE CIRCUIT.

Several of the Gordon Bennett Cup competitors continue to make assiduous practice on the Auvergne Circuit. The latest driver to appear is Henri Farman, from which it might be assumed that he will, after all, compete, although it was stated that his brother Maurice might take his place. Jenatzy has also been making the rounds, and to a correspondent he has expressed a startling opinion as to the circuit generally. He declares it to be dangerous, and so much so, that he is doubtful whether the Cup race will ever be held there at all. By this he means that the French Eliminating Trial will have so disgusted the competitors therein that they will not be willing to drive again over the same course in the actual race for the Cup. This opinion is shared by several other expert drivers. As regards the arrangements for the Eliminating Trial, it may be said that they are already well forward. It is not intended that there shall be any actual neutralisations, but there are to be two "flying controls" where the cars must slow down, in one case before a new bridge, which has yet to be constructed, and in the other at Laqueuille, where the driver of each car must retard his pace sufficiently to enable his mechanic to take a box containing the control-keeper's slip. The French Club has drawn up a series of recommendations as to the preparations for the trial, among which are the following: The surface should be made as smooth as possible wherever the road is straight, in order to reduce to a minimum the possibility of broken springs or damaged steering gear. The "donkey-backs" are to be levelled with special care. All corners should be raised on the off side, and the road should be treated with Westrumite throughout in proportions varying according to the nature

A DOCTOR'S OPINION OF THE "HUMBER."

February 7, 1905.

Dr. ——, of Much Wenlock, Salop, writes thus about his HUMBER FOUR-CYLINDER CAR.

"As I believe you supplied me with one of your first four-cylinder Light Cars, I think it only fair to write and say how pleased I am with it. I have had the car in constant use day and night for three weeks, and during that time have driven it about six or seven hundred miles over bad and very hilly roads. In my opinion it is an ideal car for a medical man, as it is very silent, and even in a hilly country like this one has se dom to get off the high gear. Another great point in its favour to a medical man is the ease of starting, as I find that even after a long wait at a patient's house the car will start 'on the switch' nine times out of ten During the three months I have had the car I have not had the slightest trouble with it; the only adjustment I have had to do was to tighten up the pump chain."

Prices: 225 to 450 Guineas.

"The new Beeston-Humber embodies all the most approved details of motor-car construction, and is a worthy example of the lead taken by British production."—**Motor News.**

of the soil. The Automobile Club de France has already put in hand its grand stand for the Cup race. It is to measure 200yds. in length, and will seat 2,000 spectators.

TO ASSIST THE POLICE.

As is well known, the police have been very active of late on the Brighton Road, and the amount of fines collected from motorists who have exceeded the speed limit has totalled a considerable sum. The "traps" have been equipped with an electrical timing apparatus, in whose accuracy the magistrates have shown unbounded confidence, with the result that convictions have followed the summonses with unfailing regularity. It has occurred to Messrs. Jarrott and Letts that they would be doing a service to the public, if they were to take steps to prevent excessive speed on the part of motorists, by arranging for a special staff of cyclists, bearing red flags, to patrol the Brighton Road and caution all those whom they consider are travelling at a speed which is illegal or dangerous. This, as the firm state in a letter which we have received, will, no doubt, be very helpful to motorists using the Brighton Road, as the cyclists who will be employed are skilled in judging speed, and will be able to indicate to any driver if his car is travelling at a speed which may cause the intervention of the police. The firm hope that their efforts will remove any ground for complaint in a way which will cause no irritation to the public, and will satisfy the police that it is unnecessary for them to continue the use of traps. In order to ascertain whether their scheme is effective or not, they will be glad if motorists on the Brighton Road will inform the cyclists if they should come upon any specially-arranged police traps. The letter is somewhat ingenuously worded, but, bearing in mind the opinion recently expressed by a well-known criminal lawyer that it is no offence to give warning of a police trap, there is every reason to suppose that the scheme will be efficacious in reducing the number of prosecutions for merely exceeding the speed limit over a stretch of open road. The patrols will be in operation during the Easter holidays.

A WORTHY OBJECT.

Colonel Purchas, the Commandant of the Gordon Boys' Home, is doing good work on behalf of automobilism by forming classes amongst his boys for instruction in motor-car mechanism. He has no funds available for purchasing the necessary appliances, and he has therefore appealed, through the Automobile Club, for assistance in the matter. He asks for two or three second-hand cars, or even parts of mechanism, and we have little doubt that the trade, or private motorists, will assist him to obtain what he requires. There must be many cars, still capable of useful service, which their owners have discarded in favour of more powerful or more up-to-date machines, and which are standing neglected in garages or stables. The work which Colonel Purchas is undertaking is of the greatest importance, as the well-being of automobilism depends very largely upon the supply of well-trained drivers of good character. The boys of the Gordon Home, well-educated, and imbued from their earliest years with the habits of good discipline and self-respect, should form excellent recruits for the ranks of motor-drivers if they are given the chance to learn the rudiments of the profession.

THE LATEST ELECTRIC LANDAULETTE.

A LONG WHEEL-BASE ELECTRIC CARRIAGE.

We illustrate herewith a new type of electric carriage, which has recently been introduced by the City and Suburban Carriage Company. The new vehicle has an unusually long wheel-base, and is very carefully sprung, so that vibration and road shocks are reduced to a minimum, even on the roughest surface. The weight of the batteries is evenly distributed between the two axles, which makes the battery compartment invisible without any sacrifice of accessibility. At present only four-seated landaulettes of this type are being constructed by the company, as these are the carriages in most demand. A new form of oilbath has recently been adopted by the firm, which not only is proof against dust and leakage, but is said to abolish any noise or rattle in the gear and greatly lengthen its life. This improvement can be fitted to any existing carriage.

RELIABILITY TRIALS.

The best reliability trials are the experiences of customers. Read the following from "The Motor," January 31st, 1905.

POWER OF FOUR-SEATED CAR.

"Sir,—In a recent issue you state, in reply to a query of 'A.L.M.' (Bowden), that 8 h.p. is a very low power for a four-seated car, etc. Last year I purchased a Gamage car fitted with a 6 h.p. De Dion engine and four-seated tonneau. On several occasions I drove it from London to Brighton and back, taking all hills, with three heavy persons and myself on board. On another occasion a motor friend of mine asserted that a 6 h.p. engined car would not take a certain hill used for testing cars. I therefore took the trouble to try mine, and it went up quite easily. It is surprising what these little engines can do.—Yours faithfully, H.H."

A CUSTOMER WRITES:—

"I think my car (a 'Gamage') is the only small car which has run from Hampshire to the North of Scotland without giving trouble. We carried three heavy passengers and 1 cwt. of luggage. I consider the 'Gamage' a wonderful little car."

RUDGE-WHITWORTH

200,000 MILES OF HARD RIDING

is the yearly total of testing new Rudge-Whitworth Models before we think them good enough for the public.

200,000 miles of hard riding to test thoroughly every new feature we adopt, Not riding on prepared tracks, but on good roads and bad roads, uphill, downhill, and on the level, in fair weather or foul, and by day and by night.

Besides this all raw material for Rudge-Whitworths has to pass the ordeal of analysis and the microscope in the Rudge-Whitworth Laboratories.

These are some of the reasons why Rudge-Whitworths surpass all others in reliability, and why they are fully guaranteed in every detail.

The prices are as low as the quality is high. This is only possible because of the enormous scale on which Rudge-Whitworths are manufactured at the great Works at Coventry.

There are 70 Models of Rudge-Whitworths from

£5 5s. to £15 15s.

or by Easy Payments from 4/3 monthly.

They are packed free and carriage paid. From all Dealers or Rudge-Whitworth Ltd., Coventry, and Branches.

THE MIGRATION OF THE VAUXHALL COMPANY.

It is only two years ago that the old-established Vauxhall Ironworks Company commenced the manufacture of automobiles by placing on the market a cleverly-designed little 5 h.p. car at a very moderate price. From this modest beginning the motor department of the firm has grown very rapidly, the first model being succeeded by a larger one of 6 h.p., and this in turn giving way to the 7—9 h.p. and 12—14 h.p. three-cylinder cars which are proving so great a success. The inevitable result has been a move into larger and more convenient premises, which for many months past have been in course of erection at Luton. The new works, which were recently opened, are provided with a very complete and up-to-date plant, whose capacity is between three and four cars per week, an output which it is intended shortly to increase to seven per week. This is, of course, exclusive of the marine engineering work of the firm. The Vauxhall cars have been "all British" from the commencement, and the reputation for sound and conscientious workmanship and well-considered design, which they have already earned, will doubtless be still further enhanced in their new home.

SOME NEW INFLATION TABLES FOR TYRES.

There is no doubt that the majority of motorists drive with their tyres insufficiently inflated. The fact is quickly apparent at any of the places where motor-cars congregate in numbers. The result is to be found in abnormal wear and tear and increased liability to puncture and side-slip, for which the pneumatic tyre is blamed, instead of the laziness or ignorance of the driver of the car. It is often forgotten, moreover, that a tyre which "stands up" well when the car is unloaded will present a very different appearance when four or five passengers are on board. Messrs. Michelin, the great French tyre-makers, have recently issued a new table of inflation pressures, to which they have added an original method of checking the accuracy of the gauge on the pump, which, as a rule, cannot be trusted implicitly. This is to measure the "depression" of the tyre, by which expression they mean the distance between the ground and the edge of the rim. This is illustrated in the accompanying diagram, and the column of minimum depressions in the table indicates the least distance between the points A and B when the tyre is inflated to its proper pressure. They lay stress on the fact, however, that chief reliance should be placed upon the pressure-gauge, and the depression measurements only used as a check upon its accuracy, as there will be found to be a difference of several millimètres between a new and an old cover, and also between different types of tyres. The depression table must be taken to refer to the car when fully loaded, as the addition of the full complement of passengers might reduce the distance between the rim and the ground by 10m.m. or 15m m. It would be, perhaps, a counsel of perfection to insist on an exact adherence to the following tables; but they will, at least, indicate to the inexperienced motorist what are the ideal conditions under which to run his tyres.

ITEMS.

The Lanchester Motor Company has opened extensive showrooms and repair shops in London at 311, Oxford Street. Mr. Frank Lanchester himself will be in charge of the firm's new London depôt.

We illustrated last week a new 70 h.p. touring car which has just been placed on the market by Messrs. Darracq. We are informed that the car, although capable of very high speed, can be regulated to run as quietly and slowly on the top gear through traffic as the firm's well-known 15 h.p. model. The dimensions of the motor are 160m.m. bore by 140m.m. stroke, and it is intended to enter the new vehicle for the forthcoming motor meetings during the season. The price complete is £1,450.

In a recent issue we illustrated a handsome side-entrance omnibus, built by the Maudslay Company. By mistake it was described as a brougham-phaeton.

Mr. Charles Glidden, who is touring the world in his car, reports that he has recently covered 2,875 miles without a single puncture of his Dunlop tyres. That such an excellent performance should have occurred on the notoriously bad roads of America and the tracks of Fiji and the southernmost portion of New Zealand, is an eloquent tribute to the durability of these British-made tyres.

The extensive works of Messrs. Panhard and Levassor, Kimberley Road, Willesden Lane, London, N.W., are open day and night, so that any requirements in the way of repairs can be instantly attended to at any time.

47, Spring Gardens, Manchester; 50, Wellington Street, Glasgow.

It has frequently been said that British manufacturers are neglectful of the markets open to them in the Colonies. We are, therefore, pleased to learn that the Duryea Company has now established agencies throughout South Africa and Australia, and last week it received an important order for cars from New Zealand. It is a noteworthy fact that quite 60 per cent. of the orders received by this company in the present year have been from colonial customers, to whom the simplicity and high efficiency of Duryeas no doubt appeal.

By the kind invitation of the Duke of Portland, the inter-club meet, arranged by the Motor Union for May 20, will take place in Welbeck Park, which is usually closed to motorists. In addition, the famous underground rooms will also be shown to visitors. In the evening, a Motor Union dinner, at which ladies will be welcome, will be held at the Victoria Station Hotel, Nottingham.

The French Automobile Club proposes to spend no less a sum than £3,200 in Westrumiting the roads of the Auvergne Circuit.

A POINT OF VANTAGE.
Watching the races in Monaco Bay.

SHOOTING NOTES.

THE MUCH-DESIRED PARTRIDGE.

IT has been urged again and again by keen sportsmen that no shooting can be considered a good one where partridges are almost unknown and only pheasants shot. Of course, there are properties where the ground is so heavy that it will not carry partridges, but that is simply a misfortune. It should produce both. How excellent, for example, is the certainty that out of every small covert, as on Mr. Gurney Buxton's shooting, described two seasons ago in COUNTRY LIFE, partridges will come over in considerable numbers with the pheasants! In Sussex French partridges add greatly to the sport of a day's covert-shooting. But the proper aim and object of preserving is to have no waste ground, and that partridges should be killed in proper proportion in the open fields, wildfowl in the marshes, and pheasants in the woods. "Cornish Chough," noting that lately owners and lessees have taken more trouble about their partridges, cites a case in which, on a small estate, the bag was raised from a "record" of 68 brace in a day to two days on which 225 brace and 204 brace were killed, and plenty were left to kill 150 brace more and leave a good stock. This was done in three years, partly by the use of a system by which semi-permanent cover for partridges was obtained on the land all through the year, especially in the winter, when, owing to its being a narrow property, birds had previously been frightened off it by agricultural work.

"REMISES," OR ARTIFICIAL PARTRIDGE COVERTS.

On every farm there will be fields or parts of fields which are sterile, or shaded by wood, or awkward to plough. The landlord can in such cases approach the farmer and say, "I will rent these portions back from you, or, rather, return you the rent." The hedges should then be carefully made up, so that men or dogs or cattle cannot trespass, the ground sown with strips of barley and rape, or, perhaps, sown with broom in parts, and the whole kept quiet. The birds will go there to rest and feed, and in the winter will drop

in as soon as the land is disturbed by labourers with plough teams, instead of moving off elsewhere. These remises are to partridges what plantations are to pheasants, and are especially useful on small properties.

EARLY AND LATE PHEASANTS.

Fashion and fox-hunting combine to bring it about that a stock of early pheasants shall be the object of the game preserver. Where fox-hunting is a regular business, and the country is constantly hunted, there is no doubt that it is far best to have forward pheasants, and to shoot the coverts while the leaf is on, so that hounds can run through them early without causing mischief. Shooting young birds early has the further advantage that fewer are lost by straying, poaching, and vermin But it is well worth remembering that a very small percentage of English counties are hunted with such persistency as to make it impossible for Masters of Hounds to keep out of heavily-stocked coverts, and that many of them cannot be said to be hunted at all. There may be one or two packs, but they meet at long distances and at considerable intervals. It cannot greatly matter in such cases whether the coverts are shot before the leaf is off, or whether they are left unshot till the later weeks of November. Again, the owner may have a very considerable area of land, and be in no kind of apprehension that the birds will stray.

SOME POINTS AS TO LATE PHEASANTS.

If he buys his eggs he will find that it makes a great difference whether he buys early or rather late eggs. The difference goes a considerable way to reduce feeding expenses. Again, if he sets his hens late he saves not only in the price of eggs, but also gains a reduction of four or five weeks' cost of feeding. The present writer, not long ago, owing to difficulties in arranging to take a shooting, set only late eggs, and not a hen went down till the third week in June. Yet these birds did excellently, were cheaply reared, and were magnificently grown birds by the beginning of the second week in November. People who have been prevented from renting shootings until late in the spring, or almost till the summer, can so stock their woods cheaply and well.

PHEASANTS FROM THE FAR EAST.

A contemporary publishes a discussion as to whether some of the birds now on sale as pure-bred, *i.e.*, Asian-bred, Chinese pheasants may not in some cases be Hagenbeck's pheasant, which is a very nearly related variety. Hagenbeck's pheasant has a very broad ring and pure white eyebrows, so that at a short distance its head looks almost white. There is a small white spot on the cheek also. What interests us more is the very great falling off in size of the Asiatic pheasant as soon as it has been in England for a generation or two. Thus, for example, the male Japanese pheasant often weighs nearly 4lb. in Japan. The Chinese pheasant (Torquatus) is also a much larger bird in China, and the Mongolian variety a very big bird. But as soon as the Torquatus has been long enough here to be Anglicised, though perfectly strong and healthy, it begins to go down in size, until it is not much larger than the old black-necked English bird. Probably this is due to soil. As an instance of the working of this law in the opposite direction, it is well known that Jersey cattle steadily tend to grow large and coarse in England, while in the United States they do so even more quickly.

SOME LESSONS OF LAST SEASON.

"Cornish Chough" writes a review of last year's shooting season, which, while closely coinciding with the view taken in these pages some time ago, adds some interesting confirmatory detail, especially as to the results on some of the best grouse moors, of which the writer has a personal knowledge. The Broomhead record has a set-off in a very different state of things on other famous moors. Thus, on Wemmergill, where bags of from 800 to 1,000 brace have often been made in a day's driving, the best bag this year was somewhere about 250 brace, and the stock was so low that shooting was soon discontinued. High Force and Holwich, and several good Cumberland and Westmorland moors, were very bad. The causes of the phenomenal record at Broomhead, where 1,370 brace were shot in one day, are difficult to seek, because moors close by are nothing like so productive. But it is surmised that the moor has special advantages in being very dry, there being few springs, and because the heather is scientifically burnt, the vermin trapped, and an exceptionally large breeding stock left; also because there are no sheep to damage the eggs in the nesting season and to compete with grouse for food. For "few springs" we should read rather "thoroughly well drained," because young grouse need water, though they probably pick up parasites in the wet, squashy places, full of moss and rushes, which abound on undrained moors.

CORRESPONDENCE.

CLIPPING PHEASANTS' WINGS.

SIR,—Though the practice of clipping the wing feathers of hen pheasants is a common one, there are very good reasons for believing that it is a mistake. The object is to keep them in open pens, partly that wild cock birds may have access to them, partly that the expense may be saved of wiring in the top of the pens. As ordinary fowls and pheasants are both close-feathered birds, and also nearly allied, what is good or bad for the former is likely to be good or bad for the latter. A case recently occurred in which a number of hens, which were laying well, caused some trouble by straying and trespassing. Several of them were caught, and each had one wing clipped. The result was that each and every one of the clipped birds ceased to lay. Several of them caught cold, and the results generally were very unsatisfactory. Properly speaking, the hen pheasants ought to moult in autumn, and get new flight feathers. But it was found by experiment at Buscot, where the hen pheasants were turned out later in the year, after being marked with a ring, that very few indeed were brought to the gun, though what became of them was not known. If open pens are used the proper course is to brail the wings, taking the brail off one wing and changing it to the other every week or ten days.—C. C.

SHOOTING TENANTS AND OWNERS.

SIR,—Experience shows that difficulties and disappointments for tenants, and also losses to owners, accrue in greater numbers every year from the neglect of "common form" in making agreements. A very hard case was recently related, in which a shooting was taken by persons who engaged

keepers and then sublet the entire shooting to other persons. The first tenants probably received their money from the sub-tenants, but did not pay their rent, neither did they pay the keepers. The results were highly detrimental in every way, besides causing the loss of rent. Hirers or letters have a right to know, the first what has happened on the shooting in recent years, and the second the character and position of hirers. It is too often assumed that because a man is ready to take shooting he is necessarily honest and well-to-do. Hirers of shootings should make a point of asking for references to recent tenants. Letters should be equally careful to obtain references of more kinds than one about those who wish to take their sporting rights.—C. J. C.

ON THE GREEN.

THERE is a story from the Ashdown Forest Golf Club that has the proverbial merit of combining amusement with instruction. At Crowborough, where is a golf green of a very similar character to that of the Ashdown Forest Club (a green that actually is on part of the tract nominally designated as Ashdown Forest), they seem to have discovered a dressing that suits the putting greens remarkably well. So the Ashdown Forest Club thought they would try the same dressing on their putting greens. Now, at Crowborough, as it appears, no cattle pasture on the course. On the Ashdown Forest Club's course the commoners' cattle have right of browsing. The new dressing was found to have an extraordinary effect on the cattle and an extraordinary attraction for them. When they were down wind from it, they came stampeding up to it, and testified their pleasure when they reached it by a species of exultant dance, which, as the ground was moist, left hoof-marks inches deep in the green. In the intervals of expressing their delight in this reprehensible way they licked up the dressing, which probably had some admixture of salt that they liked. They were so fond of it that they would not even stand quietly to be milked in their usual places if any of the stuff were within reach of their nostrils' sensibility. There is an element of humour in the idea of this wild bovine dance and capering thus induced, but there is an element of instruction, too; for it shows that what is one green's meat may be another green's poison, and that, before you try a new dressing on a green on which cattle pasture, it is prudent to find out what the cattle are likely to think of it. The very best of dressing is of doubtful virtue if it has the effect of inviting all the cows in the neighbourhood to come and dance a *can-can* where it is spread.

There is a new golfing song. It is called "A Golfer's Toast." It is written by Mr. A. T. McCaul, the music is composed by Mr. Hermann Löhr, it is published by Messrs. Chappell and Co., and it is dedicated to the Duke of Argyll. So all these points are all right about it. Also there is a good free swing, with a fine follow through, about the music, and the sentiments expressed by the words are appropriate and blameless, if not particularly exhilarating or Bacchanalian, as the name "toast" might seem to suggest. They might be sung at an afternoon tea-party; which is, of course, so much the more to their credit. But, after all, none of these professedly golfing songs ever has quite hit the mark. It is to be hoped that this new "Golfer's Toast" may be an exception; but hitherto it has seemed as if "Flat-footed Jean," or one of a like simple sentiment and humour, made more appeal to the golfer in after-dinner mood than songs which talked to him about what he had been doing all day.

They had a good field for their exhibition match on the new course at Farnham—a course which is described as promising to furnish a good test of golf, but at present still a little crude—with the two Vardons and Braid and White, but it is rather a pity that Taylor was not among them. Harry Vardon has made only two public appearances, I think, this season, one at Broadstone, where he tied with Taylor, Herd being a stroke behind both, and now this later one at Farnham. At Farnham he tied again for first place with Braid. Their score was 75; Tom Vardon was 78, and White, who is said to have got into a rabbit-scrape off his first tee shot, and to have been rather upset by this undeserved misfortune (but on a new course would it not have been better to lift without penalty from a rabbit-scrape?) was quite out of the running. Nevertheless, in the afternoon, in an international four-ball match, Braid and White did well in finishing all square with the two Vardons. Braid seems to have played the best of the four in this afternoon business, the approximate score being 76, and Harry Vardon's 78. The result shows Vardon playing very nearly, if not quite, up to his old best form, and Braid also going very strongly; and it is on this account more especially to be regretted (probably Braid himself regrets it) that Taylor was not playing with them; for Braid has two old and heavy scores against Taylor to settle, one for the beating which Taylor gave him at the end of last season, and one for a like beating (both by many holes) at the beginning of this. But no doubt these great men will have ample opportunities of coming to a settlement before the year is out. For one thing, there is always the championship—at St. Andrews, in the beginning of June.

ODDS AND ENDS.

THIS is the season of catalogues of angling appliances, and Messrs. Hardy Brothers of Alnwick issue a specially comprehensive one, devoting several pages to the education of beginners in all branches of this most fascinating sport. This firm are widely known for their large output of built cane rods, and have also a special department for the equipment of tarpon and sea fishermen generally.

—o—

MOST householders have at one time or another suffered heavily from the visits of an inefficient plumber, whose work has given rise to the impression that he was content to leave things in such a state as to ensure his services being soon required again. Apart from the annoyance caused, bad work very often is positively dangerous from a sanitary point of view, and this point is emphasised in a pamphlet recently brought to our notice by Mr. A. S. Scull, F.I.S.E., of 17, Redcliff Street, Bristol, which contains, besides, much useful information on the subject generally.

—o—

MESSRS. STORR AND SON, Exeter, are supplying an excellent Perfumed Furniture Cream, which does away with the strong smell that usually hangs about freshly-cleaned furniture, and we are assured that its utility is more, not less, than the old-fashioned preparations.

—o—

GORDON CASTLE and the adjacent village of Fochabers are being supplied by electricity, generated by utilising the water of the Spey by means

GORDON CASTLE.

of two horizontal turbines supplied and fixed by Messrs. Drake and Gorham of 66, Victoria Street, S.W., who claim that at a charge of 5s. a lamp the supply of light to the village will be cheaper than that of any other place in the country. The same firm are installing an electric plant in Stobo Castle, near Peebles, for purposes of lighting and heating.

—o—

A REALLY beautifully illustrated book, called "Historic Sites and Scenes of England," has just been published by the Great Western Railway Company. It is designed to act as a guide-book for Americans, and, as this great company's system includes the Thames Valley, Shakespeare's Country, and the moors of Devon, no railway is likely to carry more of these visitors seeking to verify with their eyes what their fathers have told them. The photographs are by no means confined to scenery, the Alfred Jewell, a chest taken out of the Armada, and John Penn all being depicted, while the letterpress teems with allusions likely to interest Transatlantic tourists.

THOUGH Easter falls late this year, we are still within the time of April showers, which often characterise May as well; therefore no one should start on a holiday without making due provision against Aquarius. Such provision cannot take better shape than one of the new "Cravenette" waterproofs. They are made in innumerable shapes and designs, but for practical use and smartness nothing could beat the "Elvira," of which I give an illustration, that also shows the back view of the coat with its graceful and original arrangement of stitched centre pleat and side gaugings which give such welcome room for the dress underneath. The Cravenette Company's process of "proofing" materials against rain is a dry one, and can be applied to all kinds of fabrics. Manufacturers send not only cloths, serges, and friezes to be cravenetted, but silks and fancy materials as well, not only to have them made rain-proof, but because the process that secures immunity from wet gives a surface that is impervious to spots. This dry-proofing of the Cravenette process not only makes a material rain-repelling, but imparts a beautiful finish which nothing can affect; and even the grease-spots one contracts so easily when travelling, motoring, or cycling can be removed from a cravenetted surface with benzine without in any way affecting the proofing. When all these advantages are combined with perfect ventilation, a most important feature in anything intended to keep out wet, one cannot wonder at the ever-increasing popularity of the "Eminent Waterproofs," the name adopted by the Cravenette Company for their delightfully-cut coats of varied design, among which may be cited for special praise the "Claudia" and the "Cingalee," as well as the "Elvira" of the illustration.

My last week's article did not at all suffice for all I have to say on the subject of cloaks, for they really are the most important garments at this precise moment of the year, when the early season has finished, and the real Season (with a capital S) has hardly begun; so I shall continue on the same text this week also. I am the more impelled thereto because since I last wrote I have been to Messrs. Hyam's (134 to 140, Oxford Street) in search of a cloak that would do for my Easter requirements of travelling, and yet be smart enough for other surroundings than railway platforms and steamers. I found an immense variety of choice, which, though exceedingly interesting, is decidedly embarrassing; but I at last anchored my unstable affections on the "Ascot" wrap, which is portrayed on the left of the illustration on the next page. This particular one was in soft grey tweed, delightful to eye and touch, and proof against both rain and showing dust. It was cut very full, long, and ample, for there is nothing more uncomfortable when travelling than a skimpy garment; and the shawl-revers were of plain silver grey cloth relieved by a charming design in fancy galon, which gave a distinctly "dressed" appearance when allowed to show. If required, however, these shawl-revers could be crossed and buttoned up to the throat, the straps of cloth, which formed graceful adornments on the shoulders when the cloak was open, becoming a neat wind and rain proof collar when the fronts were crossed and closed. A delightful feature of the coat was the cape-sleeve; for now that we have wisely returned

THE ELVIRA CRAVENETTE WATERPROOF

to sleeves that are puffed on the shoulders, a cloak or wrap requires sleeves that are proportioned to the requirements underneath. The cape-sleeves of Messrs. Hyam's wrap do this to the perfection of comfort, besides adding considerable grace and ease to the garment. The smart little travelling toque that is sketched with this cloak deserves mention. It was in fine white straw, very neat and trim, and of a shape that would permit of the wearer's head resting in a railway carriage against the cushions, which to my mind is a *sine quâ non* in any travelling hat. It had a broad band of black and white velvet binding the upturned brim, and its only adornment was a plume of cock's feathers, which have not the drawbacks of ostrich feathers for a travelling hat. The other coat in the sketch is meant for motoring or travelling; it is known as the "Goodwood," and is in great demand at this time of year, when one may hope that the weather will become too mild for fur-lined garments even on the breezy motor. This one was in black and white check Sutherland tweed, which was smartness itself, for checks of all kinds, and especially black and white, are more fashionable than ever this year. It was most beautifully and intelligently cut, as may be seen from the drawing; and its special feature was the graceful groups of pleats, which not only added height to the figure, but also gave the most delightful and comfortable fulness round the knees when sitting in a motor-car or railway carriage. The coat was fitted to the waist at the back with lines of gaugings, from each side of which started a belt bound with black leather, which held the coat to the figure at the sides, and was buttoned at either side of the central double-breasted panel with big black leather buttons, such as those which adorned the front. The sleeves were roomy and full at the shoulder without detracting from the smart "tailor-made" appearance of the coat in any way. The little motor-hat was charming in its sensible simplicity of shape, which would take a motor-veil so comfortably round its straight brim, and, being made of fine straw, its lightness was an additional virtue for a headgear one may have to wear for many hours at a time. Messrs. Hyam make rather a speciality of hats, which are both inexpensive and charming. I was specially taken with a tricorne in finest Dunstable straw, bound with ribbon velvet, an ombré buckle in front of the crown, and a hackle plume falling over the side, which was only 23s. 9d. At the same price was one of the ever-popular and comfortable "torpedo" hats in real Tuscan straw, trimmed with coloured velvet ribbon, and quaint rings of Tuscan straw at one side, through which were run large quill feathers. These were both travelling hats, but there were many others of a more ornamental and elaborate description, among which I noticed a very picturesque one in Tuscan straw, with a brown velvet rouleau inserted in the double edge, the bandeau underneath and the crown above swathed in brown tulle, and the whole crowned with a garland of wallflowers in lovely tones of brown and orange. This hat, in spite of its elaborate trimming, was the same inconspicuous price as the travelling hats I have quoted, as was also a tricorne in fancy burnt straw mixed with black, a wreath of cream and tea roses surrounding the crown and back, and a bow of black velvet at the front and sides giving an exceedingly smart finish.

TWO CLOAKS SKETCHED AT MESSRS. HYAM'S.

Now that the awful moment of spring-cleaning is upon us, and domestic upheaval and chaos are inflicted on the suffering community, it is well to give a helping hint as to the merits of Stone's Perfumed Furniture Cream. This excellent household article is admirable for cleaning and imparting a beautiful lustre to all furniture, whether french-polished or not. It is economical, too, for one does not require to pour it on the object to be cleaned, which should be wiped free from dust, and then rubbed lightly with a flannel on which a little of the Cream has been poured; after which a very little rubbing with a clean flannel will leave the chair, table, or bureau shining like new. The Cream only costs 1s. a bottle, and is manufactured by Messrs. Stone and Son, manufacturing chemists, Exeter, and can be obtained everywhere.

Those who wish to give as an Easter gift something a little more lasting than an Easter Egg should go to Messrs. Osler's, 100, Oxford Street, and see their great variety of novelties for the season in porcelain and glass. Foremost in dainty attractiveness are the quaint Dutch figures in white porcelain, the baskets and head-dresses of each figure being decorated with silver and gold, which has a charming effect. These figures are suitable as decorations for the dinner-table, as they can be used as fern and flower-holders, or as bonbonnières; and the effect of the pure white of the porcelain, with the touches of silver and gold, among foliage and flowers on a white cloth,

Franz Josef the only palatable Natural Aperient Water.

"GUELPH" DINNER WARE.

is most decorative. Another novelty is the series of vases and flower-bowls in a richly-coloured opalescent glass, which look charming when filled with flowers of delicate tones harmonising with the iridescent hues of the glass. A most admirable novelty is the "Plate and Vegetable Dish," which, with the rest of the dinner-service, was copied from an antique silver service. The ware of which it is composed is made solely for Messrs. Osler by the successors of Mr. Spode, Messrs. Copelands, and it can also be had in earthenware and porcelain. This particular design of dinner-service is known as the "Guelph," and it can be had in prices ranging from a few pounds upwards. The great variety of toilet-services at Messrs. Osler's should certainly attract attention at this period of annual renovation of domestic requirements, and a word should be said also about their immense range of designs for electric-light fittings, manufactured at their Birmingham works. The fine galleries of the firm in Oxford Street give an excellent opportunity for showing these

WHITE PORCELAIN AT MESSRS. OSLER'S.

designs, which include Sheraton, Adam, Georgian, as well as more fanciful ones, in crystal, glass, and metal; and special attention is given to fittings suitable for flats and bachelors' chambers.

LAMIA.

SHOOTING NOTES.

Poaching and Railways.

An excellent new method of detecting poached game or stolen eggs on transit is now permitted by some railway companies. A qualified detective may open, under supervision, any suspected parcel. If it contains contraband, it is quite easy to catch the receiver at the other end. To avoid this, says a contemporary, "a man, dressed in ordinary country attire, but wearing some conspicuous article, such as a glaring big red tie or a hat of peculiar shape, arrives at a busy railway station just as an express train is about to leave for London. He carries a heavy hamper, with which he rushes to the guard, and asks him to put it in the van, and he will take it on arrival at the terminus. The package bears an ordinary tag label, and on it is written: 'So-and-so, passenger to Paddington, Liverpool Street, etc.,' as the case may be, but rarely has affixed the company's label. The owner rather conspicuously carries a railway ticket, and, having given the hamper to the guard, does not wait for a reply, but forthwith rushes down the platform, with an intention, apparently, of seeking a seat. The ticket he so plainly displayed is an old one, or a twopenny one to the next station, and, mingling with the crowd, the man disappears from the station. The guard has only obtained a mere glimpse of him, but fixed in his mind is the vision of the glaring tie or curiously-shaped hat; so he thinks all is right when an individual dressed the same turns up at the terminus and claims the hamper, and if suspicious at all, a tip is sufficient to ensure silence. Of course, the whole thing has been cleverly arranged. The time of the departure of the eggs, or whatever it may be, and their arrival has been communicated to a confederate in town, and a similarity of dress between the sender and receiver agreed upon. No one travels with the consignment, and the company has no record of its having been conveyed; neither does it receive payment for having carried the hamper to London. In the way described both game and eggs have freely been sent to town, and detectives in quest of senders and receivers are advised to keep their eyes open for signs of this clever business. They will have to be careful, or the receiver will not show up at the terminus, and there is nothing on the package to reveal the identity of anyone connected with the transaction."

Sheep and Grouse.

In the interesting article by "Argus Olive" on sheep and grouse in Country Life of March 20th, Askrigg is cited as a moor where very large bags of grouse are made, though it is heavily fed with sheep. When the writer happened to be there last August he gathered that, though this hay been the case, there was a feeling that the area of heather had considerable decreased owing to the sheep, and miles could be pointed out on the sides of the Northern Pennines where what was heather is now mainly grass, for the samd reason. But discussing the sheep *versus* grouse question in the abstract, and coming to particular instances of the possible removal of sheep, are different things. In many parts of Yorkshire, Cumberland, and Westmorland the moor is common of pasture, where, though the lord of the manor has the sporting rights, every freeman has a right to feed so many sheep, and is just as free to walk over it as is the lord of the manor himself. In other places the moorland feeding forms a very important part of the assets of the farms below. In this case the landlord could, no doubt, gradually withdraw the sheep, allowing for the difference in rent to the farmers as leases dropped in. A useful and practical arrangement is that by which Sir Walter Spenser Stanhope at Dunford Bridge Moor makes it a condition of the sheep being on the moor that the keepers shall act as shepherds. This is said to answer very well. But it is clear from the foregoing that there are few places where the sheep question can be dealt with *in vacuo*.

Late Timber-hauling.

If all the cut faggots and small timber are not hauled out of the coverts by the end of the month, great mischief is done to the stock of wild pheasants or of wild-laid eggs. Pheasants are particularly fond of nesting near rides, which has the double disadvantage that the eggs are seen by every man employed in moving faggots who passes along them, and that sitting birds are far more likely to be disturbed. It is not too late to cut fresh rides in places where experience last year has shown that they are needed, but this should be done by the keeper or by some man whom he can trust.

Disease among Pheasants.

The following is an example of "how not to do things" in the way of pheasant rearing, though whether it could have been prevented, and how, we cannot say. Five thousand pheasants were hatched out on a soil of clay and loam. The birds were affected with gapes, though not in a very marked way till just before the time for putting them out in the coverts. Though they were then very bad, they were all turned into the woods, in the hope that things would right themselves. It was a fine July and August, and birds did well elsewhere. On this property, however, they died like flies, and of the 5,000 birds rather less than 2,000 were shot. The prospect for this year, judging by the way in which the gapes parasite flourishes in clay soil, must be a poor one.

Partridges on Grassland.

Some very charming illustrations were noticed the other day, in a magazine devoted to shooting and game preserving, of English-bred and trained pointers standing and backing game on the prairies of Manitoba. We have always held that the pointer, though scarcely used in England, will still be bred and trained in numbers here for use in the "new countries" and Colonies. In an article on partridges on grass land, the writer holds out very little hope of ever getting up a stock where there are arable fields near. We agree. But where the whole neighbourhood is grass partridges can be preserved. Quite a good head is obtained on grass land even in Middlesex. But in that county there are practically no hawks, which decimate the birds on the meadows where there is no cover. Hawks and the mowing machine are the great enemies of the meadow partridge; but if there are rough fields and bits of gorse or fern the birds have a far better chance of breeding safely.

LITERARY NOTES.

In the "Highways and Byways" Series of books many interesting volumes have been issued, and it is a compliment to say of the latest, *Highways and Byways in Derbyshire* (Macmillan), that it is not unworthy to take a place beside its predecessor. The writer is Mr. J. B. Firth, and his text is illustrated by Nelly Erichsen. In the composition of these books various ideals and methods have been adopted. That of the present writer may perhaps be best judged by his omissions. He says, "Of natural history and geology there is frankly nothing in the book, of science nothing, of sport nothing." Its distinguishing feature is its treatment of literary associations. The rugged beauty of Derbyshire is felt rather than described in many an interesting passage; but as a rule the author is intent on finding out the connection between the scenes he visits and the literary people associated with them. Incidentally he shows that the present delight in mountain charm is a very modern fashion. The attitude of the elder poets is very fairly exemplified in the following passage from the "Polyolbion":

> "But to th' unwearied Muse the Peake appears the while
> A withered beldam long, with bleared, waterish eyes,
> With many a bleak storm dimmed, which often to the skies
> She cast, and oft to th' earth bowed down her aged head,
> Her meagre, wrinkled face being sullied still with lead."

However, let us follow the itinerary and see what Mr Firth makes of it. He started from Kegworth in Leicestershire, whence he travelled to Melbourne in Derbyshire, through the fields almost the whole way. Naturally enough this led him to Donington Hall, which would have given a rare text to a writer on sport. Here is all that Mr. Firth makes of it:

"A little beyond we get a glimpse of Donington Hall, a plain, two-storeyed building with chapel attached. The whole estate has recently

THE

GOLDSMITHS & SILVERSMITHS COMPANY, Ltd.,

112 & 110, Regent Street, London, W.

passed into new and wealthier hands from neighbouring Burton. It was long the seat of the Earls of Huntingdon, ancestors of the first Marquis of Hastings, who lent it to Charles X. of France during the time of his exile in England. The house enjoyed a brief blaze of celebrity in the lifetime of the last Marquis, who in a few years squandered away a noble fortune. The story of Hermit's victory in the Derby of 1867—that well-remembered struggle in a snowstorm which beggared the racing Marquis—belongs to the history of the Turf. Racing may be the sport of kings, but it is a sorry amusement on which to fling away a fine estate like Donington Park."

Near Donington Hall is Melbourne Hall, where Baxter began to write "The Saints' Everlasting Rest." In later times Tom Moore often came to Melbourne, and he described its beauties in his "Pegasus." From Melbourne Hall Mr. Firth travelled to Swarkeston Bridge, Bancroft's eulogy of which is quoted with admiration. He brings the account up as late as the time of Herbert Spencer, who, when he was a young man, fished there by moonlight. It is a fine old bridge, and many will echo the author's regret that "a practical but prosaic county council should have been guilty of filling in some of the arches with vile blue bricks." Tutbury Castle is, of course, full of interesting associations, especially those connected with Queen Mary. "At Norbury we are in George Eliot's country," concerning which the author says:

"Her Loamshire is, of course, Staffordshire; her Stonyshire is Derbyshire, and the barren hills of which she speaks are the mountains of the Peak. Those who read 'Adam Bede' again after visiting this part of England, and wish to identify the places named in the novel, will not err if they interpret Oakbourne as Ashbourne, Snowfield as Wirksworth, Eagledale as Dovedale, Norbourne as Norbury. The Donnithorne Arms at Hayslope, or Ellaston, is the square, substantial-looking Bromley Arms at the cross-roads. Donnithorne Chase is either Wootton Hall, a fine old mansion a mile to the north, or Calwich Abbey, a mile to the east on the wooded right bank of the Dove—probably, we should say, the former."

Wootton Hall, which most of our readers will know, by illustration at least, was for some time the home of Jean Jacques Rousseau, who began to write his "Confessions" there. Ashbourne, again, is chiefly noteworthy in the author's eyes from its connection with Dr. Johnson. A very different literary man, Canning, refers to it in his "Loves of the Triangles":

"So down the hill, romantic Ashbourne, glides
The Derby Dilly carrying three insides;
One in each corner sits and lolls at ease,
With folded arms, propt back and outstretched knees;
While the pressed bodkin, pinched and squeezed to death,
Sweats in the midmost place and scolds and pants for breath."

The following is a description of the house in which Johnson used to visit Dr. Taylor:

"It lies opposite the Grammar School and near the Church, the last house but one on the south side of the principal street, a solid, substantial brick building, known simply as 'The Mansions.' Local tradition says that the façade was designed by a travelling Italian architect, who also designed the façade of Dr. Boswell's house—the name is most appropriate—on the other side of the street. We know from Dr. Johnson himself that the house was partly rebuilt in 1784, for he makes rather fretful reference to the building operations."

This Dr. Taylor Mr. Firth has fished out of an unpublished manuscript as having been described by the Ashbourne people as "A very good man only vicious." The famous Boothby memorial has a dedication, which the author properly enough describes as one of the mort pathetic to be found on any child's monument in England. It is this:

"To Penelope,
Only child of Sir Brooke Boothby and Dame Susannah Boothby.
Born April 11th, 1785, died March 13th, 1791.
She was in form and intellect most exquisite
The unfortunate parents ventured their all in this Frail bark,
And the wreck was total."

As he points out, the one most comparable to it is written on a simple stone in the cloisters of Westminster Abbey. It is only this: "Jane Lyster, deare child."

Dovedale, it is unnecessary to say, supplies a splendid text for a writer of Mr. Firth's idiosyncrasies. He quotes his Wordsworth to good purpose, but the praise he gives to Cotton is almost unmeasured in the following lines:

"O my beloved nymph, fair Dove,
Princess of rivers, how I love
Upon thy flowery banks to lie,
And view thy silver stream,
When gilded by a summer's beam;

And in it all that wanton fry
Playing at liberty,
And with my angle upon them,
The all of treachery
I ever learned, industriously to try!"

It would, however, take us a very long time, interesting though the task would be, to follow our author into all the nooks and dales in which he has found himself. We expected to find more about Scott in Derbyshire, but there is only a short page. Jane Austen's use of Chatsworth is minutely analysed, as will be seen from the following passage:

"The party entered Chatsworth from the Beeley side. There is mention of the sudden turn in the road near Edensor, the drop down to the bridge, the high woods behind the house, and the stables at the rear, the river, partly natural, partly artificial, and the ten-mile circuit of the park. Another

touch of local colour is Mr. Darcy's invitation to Mr. Gardiner to fish in his waters. How Elizabeth was shown over the house—trembling as Miss Austen's heroines always tremble, lest she should meet the owner—and was suddenly confronted by Darcy, who was not expected till the morrow, how she went for a walk with her uncle and aunt in the woods, and then saw Darcy following, and how she was happy and timorous at the same time, and all in the prettiest way—these things readers must find out for themselves in 'Pride and Prejudice.' If they have read and forgotten, let them read it again. Disraeli owned to having read it from cover to cover no fewer than seventeen times!" The book altogether is a charming one, and equally calculated both to delight those who love books and those who love the country.

We have read much of the beauty of the right association of colour in the garden, but have no recollection of a book confined to this subject alone. At last it has appeared, and its title, *Garden Colour* (Dent), is certainly comprehensive. Unfortunately the work is not worthy of its excellent name, but its appearance whets one's appetite for a masterly treatise on this important phase of gardening from the pen of Miss Jekyll, in whose garden at Munstead the colour schemes are the result of a true perception of colour harmony and a thorough knowledge of plant life and culture. We are sorry to condemn the present work as "hotch-potch," but in these days of hastily-compiled gardening works the public must be protected. The description of winter by the Hon. Vicary Gibbs is simply a reproduction of a paper read by him before the Royal Horticultural Society, and reprinted in the Journal of that institution. Surely in a book costing a guinea the purchaser has a right to expect something more than a lecture repeated in a journal whose circulation is immense. The book is divided naturally into four parts, spring, summer, autumn, and winter. Mrs. Earle, and, we presume, the editor, Margaret Waterfield, are responsible for spring; E. V. B., Margaret Waterfield, W. Richard Powell, Helen Crofton, and George Mount for summer; Rose S. Kingsley for autumn; and Mr. Gibbs for winter. The opening pages are from the pen of Mrs. Earle, who, in spite of a certain charm in the communication of her gardening knowledge, is greatly puzzled by botanical nomenclature. Errors of nomenclature in such a book as this should not have escaped the eye of the editor. The following are a few of the more noticeable blunders: Thersoidens for thrysoideus, Mittalia for nuttallia are repeated more than once, and Acomitefolius for aconitifolius. Even the index is not free from blunders. We have Bongainvilla for Bougainvillea, Eccromocarpus for Eccremocarpus, viburnam for viburnum, Candoblii for Candollei, and Zauscheneria for Zauschneria. We have only picked out these blunders at random from many others. A very practical contribution is that of Mr. George Mount, the well-known rose-grower; it is concerned with the "Culture of Roses," and is a valuable little essay, the selection of varieties being of much use to the beginner. The book is illustrated with many reproductions of water-colour sketches by Margaret Waterfield, which are, on the whole, deserving of much praise. They teach the value of simple grouping and massing certain colours to gain a good effect. "Crown Imperials" in Mrs. Earle's garden at the Woodlands, Cobham, is quite charming. Cyclamen coum, Anemone blanda and the Cernuus daffodil, Madonna lily and delphinium, oriental poppy and lupin, and Japanese iris in the Royal Horticultural Society's Garden at Wisley, are worth more than passing notice. It is, however, a book from which it is impossible to gain much help. There are no plans to show how to plant a mixed border with a view to beautiful colour effect, although this is exactly what so many gardeners desire. It is scrappy, and evidently hurriedly prepared—a poor imitation of the beautiful "Some English Gardens" by Gertrude Jekyll and George Elgood.

GAMES IN . . COUNTRY HOUSES.

At this season of the year now and again the hours hang rather heavily, and with the boys at home any sort of exercise is welcome. The turf is hardly in condition yet for net practice. But if an asphalte pitch has been laid down—say a patch 12yds. by 3yds.—nothing better can be wished for to give confidence to eye and hand in the opening matches of the season—matches which are rather important if school colours or a "Blue" are within sight. Balls come along so accurately on these pitches that their increased liveliness matters nothing. Cocoanut matting laid on them is an improvement, or at a pinch can be put down on a hard-rammed piece of bare earth, or even very finely-crushed gravel.

Racquet and tennis courts are, of course, for the few, but it is always a matter of surprise that more people have not taken up squash racquets. It is as quick a method of getting a good "sweat" as anything there is, and is such an accommodating game that a very little expense will soon provide a court, whether indoors or out. A coach-house door, with a concrete pavement in front, makes an excellent makeshift, and many a good game has been played in a loose box cleared of its fittings. A back wall always adds to the interest of the game; but if sheer exercise is an object, the outdoor court will give more without it. The best ball is a little red india-rubber one, which used to be procurable in Winchester, and the racquet can be anything, from a lawn tennis to a slightly shortened racquet bat. The advantage of playing in the open air will incline many to an out-of-door court, and the game does not entail that stooping, as in fives, which finds out weak spots in elderly or stout persons.

Bicycle or pony paper chases may be dismissed with the remark that they are most effective in bringing impending engagements to a head.

If a sheet of water is available it may interest some to know that a great deal of sailing can be got out of the ordinary dinghy. True, it is apt to sag to leeward when beating, but it stands up to quite an astonishing amount of sail, and the experience thus gained may some day save greater risks, for small lakes, surrounded by woods or hills, are sure to have the dangerous, sudden gusts that the yachtsman has to guard against when skirting a mountainous and indented coast. Younger brothers may be warned here that their sisters' beautifully cushioned punt is not exactly improved by shooting waterfalls in. No doubt the sport is exhilarating, but "he who pays" is apt to demur when complaints of such doings reach him.

A good deal of amusement can be got out of putting the ponies that have been hunted all the winter into tandem harness. In some cases they absolutely rebel, and the sight of one, who had been put middle horse in a farm team of three, being dragged along with all his four toes dug well in, was most comical.

Indoors, if by good luck the billiard-table is on the eve of being done up, fives may be allowed, and fine exercise it gives; though, if played at all wildly, is a bit dangerous to any glass cases there may be in the room.

ON THE GREEN.

Evidently the fashion of modern golf is running very strongly in the direction of travelling team matches—we have the historic instance of the Inverallochy fishermen most conspicuously before us. The Oxford and Cambridge Golfing Society was about the first to set the example, and has gone further than others, notably to America, where it did remarkably good things. More lately it has been touring in the St. Anne's, Formby, and Hoylake country, and a feature of the tour was the defeat of Mr. John Ball by Mr. Hoffmann, on a green, too, that Mr. Ball knows well. It is said he broke his driver at the third tee, but if there is a golfer who has natural gifts which make him little dependent on this or the other particular form of club, it is Mr Ball. I remember Mr. Graham, who knows his play so well, telling me that he did not believe there was another golfer who could make so much of one club, and who could make one club serve for so many strokes, and serve so well, as Mr. Ball. The two had often hit about together with one club on the Hoylake links. So we need not, perhaps, make much deduction from Mr. Hoffmann's win because of the accident to Mr. Ball's driver. Evidently, Mr. Hoffmann is *très fort*, as one learns to say, thinking one is talking French, at Biarritz, and may give trouble in the amateur championship. He also ought to challenge the attention of the selectors (unhappy men!) of the international team. A comparatively newcomer (all things in the professional ranks are relative to those generally undefeated old stagers Vardon, Taylor, and Braid) may be troublesome, as appears in the light of some recent performances in the open championship, and that is A. H. Toogood. As a very fine player we have known him long, but as a player fine enough to finish three strokes ahead of the next best in a field containing Vardon and Braid and White, which is what he did at Rochford the other day, we had not recognised in him before, any more than in any other golfer. So he is a force to be heavily reckoned with, if he can keep anything like this class of game going. Another instance of the travelling team tendency is the tour of the New Luffness Club, also in the Cheshire and Lancashire country. The Sassenach seems to have been a little too powerful for the Scot in some of these encounters, though the Scotsmen beat the Wallasey team; but, of course, the Sassenach had the advantage of playing at home, which always counts for something.

Although the Oxford and Cambridge Golfing Society's team was beaten in the match at Hoylake, the result is principally remarkable for the success of its leading players. On the Hoylake side were Mr. Ball, Mr. Graham, Mr. Hilton, Mr. Hutchings, and Mr. Dick as the five leaders, playing on their own ground. It is not possible to have followed the course of golf with any interest and not to recognise the remarkable strength, on paper, of this noble company, and it is a very great record, on the part of the five who were opposed to them, to win, on the thirty-six hole matches played, no less than twenty holes from them. Mr. Ball, after being two holes down to Mr. Hoffmann on the morning round, eventually won the long match by a single hole. But Mr. Hunter beat Mr. Graham by three, Mr. Darwin defeated Mr. Hilton by the same number, Mr. Low was six up on Mr. Hutchings, and Mr. Beveridge beat Mr. Dick by no less than nine. The tail of the Hoylake team wagged the head home victorious. The work of the leading players is the most interesting part of the business, and in those upper circles the visiting team had a strong and noteworthy advantage. Certainly it would not be possible to pick a team of five amateurs of whom one could say that one would care to back them to beat, at Hoylake, the five who thus suffered defeat; and even taking in professionals as well, I do not think one could find five that one would back to be twenty holes up on them, as these Oxford and Cambridge players were.

A competition in the Midlands, for professionals only, having for chief result that Williamson and Sherlock tied for first place, is evidently played out very much on its merits. Probably, if one who knew the form had had to select, out of all the large field, the two that were most likely to finish in front of the rest, these would have been just the two that he would have chosen. From which it appears that, in spite of all its glorious uncertainties, and of the results at Hoylake, golf is a game that does now and then turn out according to anticipation. The draw for the Parliamentary tournament is out, and the number of entries appears legion to a casual glance. Only a legislator could have enough spare time to count them.

Horace Hutchinson.

Sunny or Subdued Rooms.

Hall's Distemper produces fine decorative and artistic effects. With a range of 70 colours, which can be varied by combination, dining rooms, drawing rooms, libraries, halls, bedrooms, etc., can be treated in an endless variety of ways, giving *sunny or subdued* rooms equally pleasing and equally beautiful in effect.

Hall's Distemper appeals alike to the artistic and practical side of house decoration. It is sold ready to mix with water, is cleaner, cheaper, and more artistic than wall paper or paint, and is applied with a whitewash brush; it is washable, and does not fade or change colour.

Sample, Shadecard and full particulars on application to the Manufacturers, SISSONS BROS. & Co., Ltd., Hull. London Office—199B, Boro High St.

CAUTION.—*The public are cautioned against imitations of Hall's Distemper, which do not possess its unique qualities. See the name on all tins and kegs*

THE AUTOMOBILE WORLD.

"WHAT is the best car to start with?" is a question which many a novice asks himself; and by this I mean not the most reliable make, but the most suitable type of vehicle. Most people would be ready to rejoin "A single-cylinder, of course," and there is certainly much that may be said in favour of that conclusion. In using the word "novice" I refer to the non-wealthy type of owner who means to tend and drive his own car; the wealthy man who keeps a professional naturally approaches the subject from a totally different point of view.

The single-cylinder car, it may be said, is cheap as regards initial outlay, inexpensive to maintain, and involves the owner in comparatively small loss when he comes to sell it in order to buy a larger car. There is now a large array of single-cylinder cars of truly surprising efficiency, and provided the owner of such a vehicle does not essay at all times to drive it at its hardest, nor endeavour to keep pace with much more expensive and more powerful cars, and provided, above all, that he is content to have a two-seated pattern instead of overtaxing the engine, frame, tyres, and all working parts by carrying more passengers, he may derive from it an amount of pleasure and practical utility combined, which is amazing when compared with anything which even a pair-horse carriage can accomplish.

COLONEL FERGUSSON'S 18 H.P. PANHARD.

The body was built by Messrs. Hooper, and the hood is arranged so as not to interfere with the side entrance.

There is one aspect, however, which is generally lost sight of, and might more frequently be borne in mind by the prospective purchaser. One invariably hears the word "simplicity" used in connection with the single-cylinder motor, and what I wish to show is that certain advantages attach to the use of the twin-cylinder type which make it at least an arguable point that the single cylinder is not necessarily the best for the novice to acquire. I am approaching the subject solely from the standpoint of diagnosing the causes of possible trouble.

FOR WINTER USE.

This photograph shows Colonel Fergusson's car with removable brougham top in place.

Despite all that may be said by experts and others who believe that automobiles of all types are now of such proved efficiency that reliability trials and the like are no longer necessary, I venture to assert that nine out of every ten possible automobilists, if asked what prevented them from taking the plunge and ordering a car forthwith, would answer, "The fear of breakdowns." Even if one pointed out to them what motor-cars had actually done, and adduced the cases of Jones, Brown, or Robinson, who were driving automobiles with every satisfaction, the answer would probably be, "Oh, yes; but they are mechanically minded. I am not." I am convinced that the average non-automobilist is firmly of opinion that he would find himself in difficulties on the road if he acquired a car of any type; and certainly the novice who does obtain his first, and takes it out on the highway, does so with more or less apprehensiveness as to what may happen. The mysterious is always more terrifying than the actual, and it is not the possibility of having to repair a puncture or effect some definite and intelligent repair that affrights the novice, but of finding himself stranded ten miles from anywhere, and unable to determine why the engine has gone wrong.

THE FIRST MOTOR TORPEDO-BOAT.

The Thornycroft Dragonfly, which was on view at Olympia.

I propose to show, however, that the two-cylinder engine is

APPRECIATION.

Dear Sirs, Carlisle, Feb. 28th, 1905.

The Car is going as well if not better than ever. A prospective customer for your Car, a Dr. G., of Heyes, wrote to me on your chauffeur's reference, asking for particulars of the Car, and for my opinion of same. I replied to him and gave him a favourable report, and advised him strongly to buy one; at the same time gave him some of the many good points of the Car, and promised to answer any further questions as to details which he might require. I hope you may succeed in booking his order. It will not be any fault of mine if you do not. I am glad to see good press notices of your Cars at the Olympia and Manchester Exhibitions. I know mine holds its own here in public opinion, and is always admired when seen by experts and others, the general verdict being that it is "about the prettiest Car ever seen on our roads," and astonishment is always expressed at its *quiet running*. Yours faithfully,

Messrs. Alldays & Onions. (Dr.) H. Y. T.

the best to put into the hands of a novice of this type. If a single-cylinder motor stops, the driver of the car has mentally to run through the whole gamut of possible causes. He may hit on the right one at the outset; on the other hand, he may not fix upon it until he has tried everything else in vain. One might compile a lengthy list of items which the owner of a two-cylinder car, oftener than not, does not need to consider. Let us suppose, for example, that his motor is running, but on one cylinder only. Obviously the defect concerns the idle cylinder, and not any main source. The two-cylinder man has no need to examine his batteries, to see if they are run down, or to peer into his petrol tank, to see if it is empty; he does not need to examine his carburettor, in case it may be choked. The trouble is obviously not due to overheating, defective circulation, or a short circuit in the "earth wire"; in fact, these and other possible contingencies he can exclude at once from his diagnosis so long as the motor is running at all. On the other hand, he addresses himself at once to the non-working cylinder, and probably finds that it is merely a sparking plug which has broken or become foul; or, possibly, it may be a broken strand, or short circuit from some other cause, in the wiring which leads to that particular cylinder.

The single-cylinder man, on the other hand, may find himself in a quandary to know where to start his diagnosis. Naturally, he is anxious not to waste any time by pulling out his sparking plug, or examining the wiring to see if the battery itself has run down; *per contra*, he is equally loath to waste time by testing the battery and examining the wiring when the seat of the trouble is in the plug. Then, again, the owner of the two-cylinder car has the advantage when his engine does happen to stop as a whole. Unlike the single-cylinder man, he does not need to speculate as to whether the cause of stoppage is from a local or main source; he knows at once that the former is the case. Hence he can proceed to business straight away.

THE FASTEST MOTOR-BOAT IN THE WORLD.

In the race for the Prince of Monaco's Cup, Le Dubonnet attained a speed of 32 miles an hour, or 27·8 knots.

To an experienced hand there may be little to choose between the two types of motor, as he generally knows in what quarter to look for the most likely cause of any temporary trouble. With the novice, however, the case is entirely different. The fewer factors there are in the equation he has to solve the better. It is vastly more encouraging, moreover, to a man who has one cylinder of a two-cylinder motor running, and knows that he has only to locate an individual defect, than to be confronted with a single-cylinder motor which obstinately refuses to start.

COMMUTATOR.

THE AUTOMOBILE CLUB AND INCONSIDERATE DRIVING.

THE committee of the Automobile Club has once more issued an appeal to all drivers of motor-cars to show every consideration and courtesy to other users of the highway, and calls upon the members of the club to set a good example in this respect. The public are invited to report to the secretary, at 119, Piccadilly, any flagrant offences against the laws of etiquette and good feeling, and an assurance is given that the special committee which sits to consider such complaints will take the proper measures for penalising offenders. Of course, the powers of the club are limited to its own members and the members of its numerous allied organisations, but as these number many thousands the influence that the committee can bring to bear, either directly or indirectly, is very great. The appeal, which is signed by the chairman, the Hon. Arthur Stanley, M.P., concludes in the following words: "It cannot be too well known that we intend to exercise our powers rigidly and impartially over all persons subject to our authority, since we recognise that nothing could be more prejudicial to automobilism than a general belief that the leaders of the movement are indifferent to the safety, the comfort, and the good opinion of the public."

A SEQUEL TO TWO RECENT CONVICTIONS.

During the last few weeks two of the drivers nominated for the British Eliminating Trials have figured in police-court cases. Bianchi was fined at Farnham for driving a Wolseley racer to the common danger, and Mr. Lisle of the Star Company was involved in a serious accident near Liverpool, when in charge of one of his firm's old Gordon Bennett cars. Mr. Lisle was fined £50, and his licence was suspended for two years. This, however, in itself would not prevent his taking part in the Eliminating Trials, as the Motor-car Act does not apply to the Isle of Man. These two cases having been brought to the notice of the Automobile Club, Messrs. Bianchi and Lisle have been summoned before the committee to show cause why they should not be struck off the competitors' register. In taking this action the club is carrying out the policy announced a year ago, when it decided to prevent, as far as possible, the tuning-up of racing cars on the roads of this country. A resolution was then passed that any car built to comply with the Gordon Bennett conditions, which was driven on the roads at a speed exceeding the legal limit, should be liable, together with its driver, to be disqualified from taking part in the race.

REPORT OF THE ALCOHOL COMMITTEE.

Those motorists who have come to regard the industrial alcohol question as one that mainly concerns the future of that spirit as a fuel for motor-vehicles, will read the report of the Departmental Committee, which has been sitting for some months past, with a sense of disappointment, and possibly of surprise. Out of twenty-five pages of closely-printed matter, only three short paragraphs are devoted exclusively to the use of alcohol as a source of motive power, and these dismiss the subject as one of little present importance from the point of view of the committee. "Spirit is not used at present in this country," says the report, "as a fuel for motor-vehicles. Nor is it used to any great extent either in Germany or in France, in spite of the fact that both these countries are most desirous of encouraging the use of a material that is indigenous, in preference to a material, like petrol, that has to be imported. Where spirit is used for motor or other engines in these countries, it is almost entirely for agricultural engines. For motor-cars, spirit presents certain special difficulties which require to be overcome, the principal being the behaviour of alcohol in very cold weather, and the tendency of the acids generated by its combustion to cause corrosion of the metal surfaces with which they come in contact." This latter point is one that has been either overlooked or ignored by the advocates of alcohol in this country, and it is, therefore, of interest to ascertain on what evidence this statement in the report was founded. The witnesses who gave evidence before the committee as to the possibility of using alcohol for motor-cars were Professor Vernon Boys, F.R.S., representing the Automobile Club, and Dr. Ormandy, representing the Society of Motor Manufacturers and Traders. Professor Boys admitted ignorance as to the alleged corrosive effect of alcohol, and Dr. Ormandy threw little light on the subject except to state that the exhaust gases from German motor alcohol contained little or no acid products. It is clear, however, that the sub-committee, consisting of Sir Henry Primrose and Dr. T. E. Thorpe, which went to Germany to study the use of industrial alcohol in that country, obtained very strong evidence on the subject of corrosion in alcohol motors. No mention of this vital question is made in the sub-committee's report, but the questions put to Professor Boys by Dr. Thorpe, which are to be found in the bulky minutes of evidence, place the matter in a startling light. Dr. Thorpe, in the course of his interrogations, and in order to explain them, made the following statements: "We were told that all the running parts of the machinery were very quickly corroded, and that that was due to the relatively large quantities of acetic acid which were produced. We were informed also that although theoretically much better results might, from a mechanical point of view, come from the use of high compression, nevertheless it appeared that the increase in the formation of these acid products was so considerable that an effective stop was soon brought to this economical effect." Dr. Thorpe also stated that although even the police tried to enforce the use of alcohol for motor-vehicles, in certain cases their efforts were rendered nugatory owing to the corrosion that resulted, with a consequent increase in repair bills. On the subject of the difficulty of starting in cold weather he was equally emphatic. "We were also informed," he said to Professor Boys, "and we were in Berlin at a time when we could ourselves verify the fact, that any alcohol engine which they have at present had occasion to use is, in very cold weather, practically unworkable on account of the difficulty of starting it. It is not only the starting, but it is also the running for some time after the starting has taken place, that is the difficulty."

These statements seem to prove that alcohol as a fuel for motor-cars is hardly at present within the range of practical politics, though it by no means follows that the difficulties may not be overcome in the future. The recommendations of the committee, if adopted by the Government, will have the effect of materially reducing the price of methylated spirit, which, apart from the objections inherent in all varieties of industrial alcohol, is admitted to be suitable for use in explosion engines; and although its price can never approximate to the present very low price of petrol, the reduction may be sufficient to encourage experiments with a view to overcoming the present difficulties that beset its use for motor-cars.

Here and there in the report are to be found items of interest to the motorist. On the all-important question of price it is stated that at the present time industrial alcohol is cheaper in this country than in Germany,

and that even in normal years its price is not as much below the price in this country as the committee had been led to suppose. If the proposals of the committee are adopted it is anticipated that the average price of industrial spirit in the United Kingdom will be even lower than the average price in Germany. The large consumption of spirit for heating and lighting in the latter country is attributed solely to its cheapness as compared with coal gas and oil. In the United Kingdom, with cheap gas and oil, no conceivable reduction in the price of methylated spirit would enable it to compete with them. So far as stationary engines are concerned, even Dr. Ormandy, who is a strong advocate of alcohol for motor-cars, admitted that no liquid fuel could ever hope to compete with suction gas so long as coal is at anything like its present price. It has often been held out as an argument in favour of replacing petrol by alcohol, that the farmers would benefit by growing the potatoes from which the spirit is distilled. The report is emphatic in disposing of this fallacy, as it states that "in the present agricultural conditions of this country, it would not be possible to found a profitable industry on the employment of potatoes as a material for distillation."

A Veteran's Opinion of the Auvergne Circuit.

To an interviewer who questioned M. Girardot, on his return from Clermont-Ferrand, as to his impressions of the Auvergne Circuit, he said that he found the course very tiring to the arms, and till the Eliminatory Trials took place he intended to take up physical exercises and boxing to fit himself for the strain. On being asked what he considered likely to be the average speed made by the winning cars, he stated that, after careful consideration, he had come to the conclusion that the car which did each round in 1hr. 40min. to 1hr. 45min. would have the best chance of success. Drivers would very likely exceed this speed in the first round or two, but he believed that those who did so would run grave risks of not completing the course.

M. Meyan's Challenge.

It will be remembered that M. Paul Meyan, fired by a statement in an advertisement in *The Times*, to the effect that an English car held the world's record for reliability, recently expressed his willingness to run his French car, which he has had in daily use for over a year, against any British-built machine. He suggested a total distance of 5,000 kilomètres, the daily runs to be from 350 to 400 kilomètres, and the stakes 10,000fr. aside. This challenge was promptly accepted by Mr. Siddeley, the only conditions attached to his acceptance being that half the distance should be run in this country and that for that part of the contest the daily distance should be reduced in order to comply with the speed regulations. One's faith in M. Meyan's anxiety to test his car against the Siddeley is somewhat shaken by the very weak objections which he has raised to Mr. Siddeley's proposals. He has replied that, as a trial of endurance and regularity in running, twice 2,500 kilomètres is not equal to 5,000 kilomètres without a break, and that during the transport of the cars across the Channel there would be a cessation of the strain of running, which was contrary to the object he had in view in issuing his challenge. It is difficult to believe that M. Meyan puts forward this objection in a serious spirit. The passage of the Channel occupies a couple of hours at the most, and it would be easy to finish one day's run at Calais, and commence the next at Dover. He also takes his stand on the question of the daily maximum. Possibly, Mr. Siddeley may give way on this point, as it is one that concerns the endurance of the driver rather than that of the car. The average speed must, of necessity, be lower in England than in France, but this could be made up by longer hours of running.

Road Accident Statistics.

Some interesting statistics have been forthcoming of late concerning the number of accidents due to various forms of locomotion within the metropolitan area. There was some amount of outcry in anti-automobile quarters when the first official statistics were published, as these related to automobile accidents alone, and were embodied in a reply to a question in the House of Commons by Captain Donelan. Since then, however, both Mr. Vincent Kennedy and the Hon. John Scott Montagu have put questions concerning accidents due to horse traction. Mr. Kennedy's question concerned horse accidents from June, 1904, to March of the present year, while Mr. Montagu's return comprises the whole of the year 1904, and includes the causes of accident under seven different headings, as follows: Horses, horse-driven vehicles excluding trams, horse-driven tramcars, mechanically-propelled tramcars, motor-omnibuses, motor-cars, and motor-cycles. The following table gives the complete figures:

Cause of Accident.	*Accidents to Persons or Property.*	*No. of Accidents to Property.*	*No. of Accidents to Persons.*	*Persons injured in Accidents shown in Col. IV.*	*Nature of Accidents enumerated in Column.*		
					Slight.	*Serious.*	*Fatal.*
I.	*II.*	*III.*	*IV.*	*V.*	*VI.*	*VII.*	*VIII.*
Horses	641	444	193	209	181	28	—
Horse-drawn vehicles, excluding trams ...	21771	16834	5798	5989	5193	676	120
Tramcars (horse-drawn)	1287	1060	246	260	222	35	3
Tramcars (mechanically propelled)... ...	2292	1785	528	539	470	65	4
Omnibuses (mechanically propelled) ...	30	12	19	22	18	2	2

BROTHERHOOD .. CAR ..

(20 H.P. 4 CYLINDERS).

"We had an opportunity of trying the new Brotherhood, under the expert control of Mr. Percy Richardson, who has been mainly responsible for its production. The point which struck us most was the excellence of the Carburetter, which allowed of the engine running efficiently at something like 150 revolutions per minute. In fact, Mr. Richardson drove us for miles through traffic without ever taking the clutch out, and at times the pace was a regular crawl. The control is altogether effected by a side movement of the right foot. There could not possibly be an easier way of application or more instantaneous. In fact, taken altogether, the control of this car is perfect. We noticed, too, that it picked up with extraordinary rapidity. At one moment we would be crawling through dense traffic, then an opening would suddenly occur, and a slight movement of the toe would send the car bounding forward like a projectile, only to be pulled up further on, as the traffic closed in, almost as quickly. The way Mr. Richardson handled the car was a liberal education in what can be done with a good motor. In this car the flexibility of the engine was good, while for power it seemed extraordinarily efficient, to judge from the one or two short bursts we were able to indulge in."—*Extract from MOTOR NEWS, March 4th, 1905.*

Engineers, Yacht Builders and Agents.

There are reasons why Daimler cars are so much in demand, and we should like to have you consider them if you are buying a car. In building we aim through scientific construction to attain simplicity in all mechanism, which minimises the possibilities of getting out of order. Accessibility of all parts is attained to save time and trouble. We develop efficiency of transmission of power, and introduce ball bearings throughout to make easy and quiet running. Beauty of design in body and fittings is the last word in comfort and satisfaction.

JAMES & BROWNE, Ltd., 395, Oxford Street, W.

while the total for motor-cars and motor-cycles was 2,049. Of accidents to persons, horses and horse-drawn vehicles were responsible for 5,591, while in the case of cars and motor-cycles the figures were 579. As regards fatalities, those due to horses and horse-drawn vehicles amounted to 120, while in the case of motor-vehicles the total was 17. Of accidents defined as serious there were 704 in the former category, and 92 in the latter. As to the extent to which the various accidents related to persons injured by vehicles, as compared to injuries to persons on the vehicles, it is impossible to do more than surmise, and no argument can be deduced therefrom, either for or against horses, or for or against motor-cars. One cannot, moreover, determine the degree of importance to be attached to the police definition of a "cause," nor to the differences between slight and serious results; the fatalities, however, speak for themselves. It can hardly be said that the figures as to horse traffic, generally, are capable of affording much satisfaction to believers in animal locomotion. What the number of horses in use in the metropolis may be it is impossible to state, but the percentage of casualties is undoubtedly high. Of course, it may at once be pointed out, concerning the vast preponderance of accidents due to horse-drawn vehicles, that they vastly outnumber motor-vehicles. It is only fair, however, to the automobile to state that even if the figures were ascertainable, the comparison would be very far from being exact, for the simple reason that the travelling capacities of the two types are so tremendously diverse. The average motor-vehicle undoubtedly travels at least ten miles for every one accomplished by the horse; indeed, the ratio is probably much higher. Obviously, therefore, the possibility of casualty is increased in the case of the vehicle with the widest radius of travel, and it would be fairer to discuss the problem on a basis of actual mileage. It may further be pointed out, moreover, that while the factors as to horses are tolerably constant, everything about motor-cars is in a more or less transitional state. Some of the accidents, no doubt, are due to side-slip, but as time goes on, and highways are improved, it may be hoped that this source may be eliminated. Taken altogether, however, the figures relating to horse-drawn or self-propelled vehicles alike may be regarded as showing that the toll which we pay for locomotion of any kind is heavy, and that greater efforts should be made by the authorities in the shape of widening roads and streets, rounding dangerous corners, and in many other respects improving the facilities for traffic and reducing to the minimum the sources of possible disaster.

WOLSELEY MAIL VAN.

A WOLSELEY MAIL VAN.

We illustrate herewith a Wolseley mail van which has just been supplied to the postal authorities. The body is 7ft. 2in. long, 5ft. 3in. wide, and 5ft. 10in. high, and the maximum load for which the van is designed is 20cwt. The motor is a standard 12 h.p. Wolseley, having two horizontal cylinders $4\frac{1}{2}$in. bore by 5in. stroke, and running at 800 revolutions per minute. The transmission mechanism follows the usual Wolseley practice, and is geared to give four forward speeds, of five, eight, twelve, and seventeen miles respectively, and one reverse, of five miles per hour. The total weight of the vehicle is 24cwt., and the wheels are shod with solid rubber tyres, front and back. The Wolseley cars are famed throughout the world for their reliability, solid construction, and durability, and should therefore prove particularly suitable for the work of the Post Office.

THE BEST LIGHT CAR.

Look at this reliability record for one year, 4,572 miles covered.

EXTRACT FROM LETTER RECEIVED FROM A MEDICAL MAN.

MESSRS. JARROTT AND LETTS. CORNWALL,
DEAR SIRS, *March 8th*, 1905.

"I completed my first year's running on the 5 h.p. OLDSMOBILE I had on Feb. 16th, 1904, and think you may like to hear how I've got on. I had **no previous knowledge of cars**, and have looked after the car myself. **It has been out almost every day**, and there **has never been a day on which the car was not fit to run. . . . . It has run in all weathers**, including **frost and snow**, over an **extremely hilly country**; most of my hills have **a grade of 1 in 6 (measured)** somewhere on them. **In the twelve months I have covered 4,572 miles, and have never had a tow. . . .** The car has the **record of having climbed the worst hill** in my district **without having to turn out its passengers. The 'Olds' has been such a boon that I cannot say too much in her favour.**"

Yours very truly,
(*Signed*) MONTAGUE W. ROE.

This speaks for itself and proves that the

OLDSMOBILE

Accomplishes everything and goes anywhere.

THE

DE DIETRICH

Extract from "Autocar," April 8th:—

"The 24 h.p. De Dietrich, with side entrance phaeton "body and forward bucket seats, is without doubt one "of the most comfortable running cars in which we "have yet ridden. It is superbly sprung, and sits "down upon the road like a railway train upon the "metals. The inequalities of the road surface were "hardly felt, and there is absolutely no side swing "of the body.

"All the rises between the West End of London and "Guildford, including the test hill in Richmond "Park, were smoothened out as of no account by "this powerful and sweet-running car. The 24 h.p. "De Dietrich engine is a remarkably flexible motor, "and enables this car to be run on fourth speed "down almost to a crawl, the throttle setting aiding "very greatly in this respect."

Absolutely Reliable. Perfectly Silent.

16 h.p. 24 h.p. 40 h.p. 60 h.p.

Suitable for any type of carriage body.

MOTORISTS AND DOGS.

The vexed question of dogs and motorists has again arisen in connection with a letter in *The Times* from Mr. H. Plunket Greene. He relates how two nurses with two children were walking along the Andover Road, just above the village of Hurstbourne Priors. "They had a small Aberdeen terrier with them. A motor-car containing two men and a lady, and travelling very fast, came up behind them. The nurses and children got out of the way in time, but the dog was not so fortunate. The chauffeur shouted at him, and then deliberately ran him down and drove on." The driving on, in the circumstances, was unquestionably heartless, and incapable of defence, but the culpability of the driver in respect of the death of the dog is quite another matter. Everybody knows how dogs will dash suddenly in front of the wheels of a motor-car, and often just at the time, moreover, when the driver is avoiding something else. Mr. Greene, in a later portion of his letter, unconsciously refutes his own allegation as to the fast driving of the car. Being anxious to detect the culprit, he gives full details as to the car and its occupants, according to description, and also gives a time-table of the car's journey along the Andover Road. He states specifically that it passed through Hurstbourne Priors at four o'clock, and the village of Whitchurch at 4.15. The distance between these two places is just two miles! On his own showing, therefore, he proves the car to have been travelling at the rate of eight miles an hour, and how any accusation of furious driving can be laid against a driver who proceeds at so moderate a speed, it is difficult to understand.

ROAD IMPROVEMENT.

There is much that is commendable in the annual report of the Roads Improvement Association, and traffic on our highways would be a very different matter if the aims of that body could be carried into effect. At present there is no central administration of the roads, and the control of continuous highways, like the Great North Road, for example, is split up among numerous authorities. In many cases the jurisdictions of the different authorities overlap, and it is impossible to tell where one begins and the other ends; while, as for bringing pressure to bear on any with a view of carrying through any scheme of reform, that also is equally impracticable. A striking illustration of the evil which results from this state of things has been afforded recently in the case of the tramway extension on the road to Barnet. The obnoxious central standards have been erected for four miles through North Finchley, in spite of protestations from outside. The Board of Trade has expressed its disapproval of these standards on general grounds, and the Middlesex County Council endeavoured to prevent their erection, but the District Council were able to snap their fingers at these higher authorities, and insist upon the erection of what is notoriously one of the most dangerous attendant features of tramway usage. It is interesting to note, therefore, that the Roads Improvement Association has prepared a Highways Bill to give effect to the principal recommendations of the Departmental Committee on Highways, which was appointed at the instigation of the association in 1903, by the President of the Local Government Board. The main objects of this Bill will be as follows: "(1) To create a central department for the purpose of assisting the local highway authorities. (2) To increase largely the highway powers of the county authorities. (3) To provide for the construction of new main roads through and out of the large urban districts. (4) To protect the interest of the ratepayers by providing that suburban districts shall be laid out according to some definite plan, under which new trunk roads of adequate width shall be built, and the existing ones widened before building operations commence, and so render unnecessary costly street widening and improvement schemes. (5) To amend the law relating to the maintenance of bridges."

YACHTING FOR THE MANY.

TILL a year or two ago, yachting and its delights were confined to a very small circle, but now for the quite moderate sum of twenty-five guineas, the traveller who books a berth on a P. and O. steam yacht is comfortably housed, fed, and carried over nearly 4,000 miles within a space of three weeks. Take the forthcoming cruise of that popular vessel the Vectis as an example. It will start from London on May 12th, and last right on through all the remaining days of that month, and, during the nineteen days that intervene, visits will be paid to such diverse and deeply interesting spots as Lisbon, Tangier, Algiers, Palma, Barcelona, Malaga, and Gibraltar, to say nothing of facilities offered for a tour to Granada and the Alhambra. Moreover, although the sum of twenty-five guineas has been cited as the average fare for this trip, it must not be forgotten that, varying with the position of one's berth, the cruise may also be accomplished for an inclusive charge of twenty or even eighteen guineas. Surely this represents the last word in the economy of luxurious ocean travelling.

But little reflection is needed to conjure up a lively picture of the varied charm represented by the ports of call on the programme of the Vectis. For one thing, it should be noted that there is no more delightful month than May in the year's cycle in which to tour these Southern waters; the sun may always be counted upon to be in evidence from dawn to dusk, the winds have outgrown their winter fickleness, and rain is a factor nearly unknown. Given, then, such ideal climatic conditions, the entire success of the cruise is ensured by the variety of its itinerary. This enables the traveller to sample Portuguese life in its celebrated capital, to take a peep at the immemorial East in Tangier, to observe how our French friends carry on at Algiers a work kindred to our own in Egypt, to make the acquaintance of life in the Balearic Isles, to see the Spaniards at home in such diverse cities as Barcelona and Malaga, and finally to gain personal knowledge of Gibraltar, that famous fortress upon which more than fifty millions of British money have been expended. Lisbon, the first port of call, will furnish more than adequate enjoyment for the day the Vectis will remain in its harbour The picturesque architecture of the city, the spacious streets and squares, the lively manners of the people, and the unrivalled views which abound at every turn cannot fail to fill the hours spent there with pleasure. If, too, the tourist is minded to forego the sights of Lisbon for the sake of an excursion to Cintra, he will have made a choice tinged by no after-regrets. From the

AN EASTERN OASIS.

capital of Portugal to the Moorish city of Tangier is but a day's sail, but the change of scene is as pronounced as though the voyage had occupied as many days as it does hours. For Tangier is one of those few cities where the flight of time does not count. Here the traveller is face to face with the East, the immovable, unchanging East. Henceforward the pages of the "Arabian

Dewar's

The Whisky of MANY Merits.

Nights" are as instinct with life as those of the most modern novel. Indeed, right throughout, one of the peculiar charms of this Vectis cruise is the almost startling manner in which it furnishes the student of books with the invaluable equipment of local atmosphere.

Algiers is, of course, most interesting for its combination of the gaiety of French life with the more stolid ways of the East; but the tourist who is bent upon gathering novel impressions will probably devote most of his hours here to the Arab quarters, which are full of picturesque corners. In addition, there are numerous walks or drives in the vicinity of the city, having for background the glittering peaks of the Atlas Mountains.

Perhaps, however, the tourist will look forward with most interest to the next stage of his journey, which will take him to the beautiful Bay of Palma, the capital of Majorca in the Balearic

AT CINTRA.

Islands. Nor need he anticipate disappointment. Few more memorable sights will meet his eyes than the view of Palma from the bay, a picture in which the dominant note is struck by the magnificent Gothic towers and south front of the cathedral. That ancient fane, and many of the smaller churches, will amply repay a visit, and among the other buildings which should not be overlooked are the Louja and the Castle of Bellver. Also, several delightful excursions may be made during the halt at Palma; and in all his wanderings the tourist will have the satisfaction of knowing that he is here more off the beaten track than at any other stage of his cruise.

THE ALHAMBRA.

There are still, however, the sights of Barcelona and Malaga and Gibraltar awaiting him. If, too, he would gain a more adequate idea of the Alhambra than is possible from its namesake in Leicester Square, he should leave the Vectis at Malaga, travel overland to Granada, and enjoy the actual vision of the renowned citadel and palace of the Moorish kings. To have seen those marvellous galleries, courts, and fountains will prove ample recompense for missing some of the sights of Gibraltar, at which port he will join the ship for the journey home.

RACING NOTES.

DURING the past week there has been but little racing of any importance upon which to comment. The Hawthorn Hill Spring Meeting is always a popular fixture, and, in spite of an extremely bad outlook as far as the weather was concerned, the specials on both the South Western and Great Western Railways were well filled with enthusiastic race-goers. Backers began well in the Windsor Handicap Hurdle Race, but they had some little excitement before they could safely reckon up their gains, for the favourite, Mr. T. Brown's Perigarnet, only just got home by a neck from Miss Cronkhill. The victory of Sir R. Wilmot's Demonstrator in the Grove Selling Handicap Steeplechase was very popular, and Mr. W. G. Bulteel, who rode him, received quite an ovation on returning to scale. Dollery rode quite a brilliant race when he squeezed Precocious home by a head in the Monday Selling Hurdle Race; and Mr. C. Bewicke, who is, I think, a nephew of "the" Captain Percy Bewicke, had a comfortable winning ride on his own horse Euskan in the Farm Selling National Hunt Flat Race; and his example was

I-Z-A-L

Officially Adopted by H.M. Government

Every contagious disease arises as the result of neglecting to destroy the germs from which it originates. A prolific source of these germs is putrefaction from a sink, drain, etc., though sometimes they are present without any warning odour. The use of Izal,

THE IDEAL DISINFECTANT

removes all shadow of risk of contagion, because, no matter what type of germ may be present, it is instantly destroyed by this powerful antiseptic.

You will be well-repaid a perusal of the little book Dr. Andrew Wilson has written on this subject. A free copy will be sent to you if you write to NEWTON, CHAMBERS & CO., Ltd. (Dept. 30), Thorncliffe, near Sheffield.

Izal is pleasant to use, non-poisonous, and very economical. To be had everywhere, 6d, 1/-, 2/6, and 4/6.

ELLIMAN, SONS & Co., SLOUGH, ENG.

followed by Mr. H. Ashton and his mare Ellaline II. in the Bracknell Handicap Steeplechase.

On Tuesday, the second day of the meeting, the weather was altogether cold and disagreeable, but the attendance was quite up to the average and the sport was interesting throughout. St. Vincent had apparently won the March Maiden Hurdle Race, the principal race of the afternoon, when he fell and left the favourite, Gallant Blue, to go in and win by a length after a good race home with Venezia. In the Binfield Handicap Steeplechase, Questionable, with Mr. H. Rich in the saddle, followed up his success at the Beaufort Hunt Meeting, and won easily by ten lengths from Ellaline II.

Messrs. Pratt and Co. are to be congratulated on the success of the Folkestone Meeting on the 19th inst., and it is pleasant to note that under their able management the pleasant Kent gathering is rapidly acquiring a firm hold on the favour of the public. It was certainly unfortunate that Griggs, who is riding extremely well, should have had the misfortune to break his collar bone, owing to his mount, Luke Delmage, crossing his legs and coming down after passing the post. However, medical assistance was speedily forthcoming, and, after all, a broken collar-bone is not in itself a very serious injury, and it is to be hoped that in a few weeks' time Griggs will be once more in the saddle.

There are few items of news of any interest, as far as racing is concerned, to record. The regrettable incident of the supposed scratching of Dean Swift for the City and Suburban Handicap by means of a telegram purporting to have been sent by Mr. Joel, and entirely repudiated by that gentleman, caused a momentary sensation of a very mild description; and it is difficult to understand the motives which could have prompted the perpetration of a singularly ill-timed attempt at a joke. Whoever he or she may be, they are perhaps unaware that, if detected, they are liable to a prosecution for forgery, with its attendant penalties.

The Queen's Prize at Kempton Park, the City and Suburban, and other races of importance will have been decided before these notes appear; but, for whatever it may be worth, my opinion as to their probable results has been already given, and I must perforce abide by it. The City and Suburban, in particular, has been won by many first-class horses, and has been the medium for many a heavy gamble. Amongst all the races for this popular handicap, perhaps not the least memorable was that which took place in 1854, when the wonderful mare Virago performed the extraordinary feat of winning both the City and Suburban and the Great Metropolitan on the same afternoon, and within the space of about an hour. There was a battle-royal that day between the great Danebury establishment and the celebrated Findon stables. The Findon division backed the mare as if the race was already over and won. Nothing loth, the Daneburyites stood by their champion, Marc Anthony, and by sheer weight of metal brought him from 8 to 1 to 7 to 2, young John Day in particular declaring that nothing short of a flier would beat him. Do what they would, however, the adherents of Virago were true to their faith in the flying mare, and when the numbers went up 6 to 4 was the best offer obtainable against her, and even that they took, her owner and his friends, moreover, taking 20 to 1 about her winning both races. The result of the City and Suburban was never in doubt, for she won in a canter by three lengths. Within the hour she went to the post with a 5lb. penalty, to start for the Great Metropolitan, a race of two miles and a quarter, and, showing not the slightest trace of her previous exertions, won cleverly by a length. She must have been an exceptionally brilliant mare, for she ran eleven times as a three year old and was only once beaten. Before going to Epsom she was tried with a horse called Little Harry, and the weights were Virago, 3 years, 8st. 7lb., Little Harry, 5 years, 7st. 7lb., and the mare was beaten by a neck. Little Harry afterwards won the Ascot Stakes, carrying 8st. 7lb.

The City and Suburban of 1872, which was won by Digby Grand, reminds one of the story told about George Fordham by Sir George Chetwynd. The day after the race Fordham was to ride the horse in the Prince of Wales's Stakes, but it appeared that he was a horse of rather an uncertain disposition, and that his owner believed that a little stimulant was likely to be of benefit to him. "When," says Sir George, "Fordham was adjusting his saddle previous to mounting, he observed Harry Woolcott, the trainer, with a black bottle in his hand. 'What's that, Harry?' he asked. 'A bottle of old port Mr. Graham has sent to give Digby,' replied Woolcott. 'Let's have a look at it,' said Fordham, and, holding out his hand for the bottle, he meditatively took a long pull at its contents. Silently he handed the bottle back to Woolcott, who followed his example, and then Fordham regained possession of it, observing, 'I don't believe it would do him any good!' saying which, he raised it again to his lips and tilted it considerably before he put it down. 'I believe it generally is bad for them,' rejoined Woolcott, who very nearly emptied it, and Fordham, looking to see if there was any left, found that there was a little, and quietly finished that, Digby Grand looked on, and it is impossible to guess what he would have said if he could have spoken." However, it can at least be said that if the port did not benefit the horse, it did Fordham no harm, for he brought his mount up at the Bell and won easily.

As regards any speculation on the Two Thousand Guineas, nothing much will be done until M. E. Blanc has disclosed his intentions. Last year it was stated that, owing to the pronounced superiority of his horses, and especially of the produce of Flying Fox, there had been a marked falling off in the returns from the betting at the Pari Mutuel in France, and there are unmistakable signs that wherever his horses are engaged in races in this country there is considerable reluctance on the part of the fielders to open out against them. It is true that we have no clearly-defined champion to oppose the best of M. Blanc's representatives in our classic races; but, on the other hand, there is up to the present no proof that there is any really first-class three year old on the other side of the Channel. Personally speaking, I believe that Jardy is quite a good horse; it may be that Val d'Or is even better, and recent running goes to show that in default of either of these horses, M. E. Blanc has other good animals in Genial and Adam. There is every reason, therefore, to think that the French attack will be very formidable during the present season. But there is no cause for despair; a

LEA & FRANCIS Ltd. COVENTRY and LONDON - 69, Piccadilly, W

ADDRESS OF NEAREST AGENT SENT ON APPLICATION.

gallant foe is always welcome, and laurels won without a struggle are not worth wearing. It is much to be hoped that after all Cicero may prove to be a worthy successor to Ladas and Sir Visto, and although he has not been seen out for some time, we may be sure of this at least—that no stone will be left unturned to enable him to take his part in defending the interests of his owner and the public in the struggle for the great race of the year, and to my way of thinking, Rouge Croix, if all goes well with him, will win at least one of the principal events for Mr. Henning.

After the Epsom Meeting come two very interesting days' racing at Sandown Park, which will take place on Friday and Saturday, the 28th and 29th inst. Imperial II. has such a tremendous burst of speed that, including his 5lb. penalty, he should be returned the winner of the Prince of Wales's Handicap on the Friday, and the Cobham Two Year Old Maiden Plate may be won by Sophron, while the 6lb. breeding allowance which can be claimed by Scotch Mistake will give the daughter of Ayrshire and Miss Springfield an undeniable chance of accounting for the Sandown Park Stud Produce Stakes. On the Saturday Buckaway II. (9st. 12lb.) would seem on his running in the Grand National to be remarkably well in, but he may be found to be a trifle short of speed on the galloping Sandown course. TRENTON.

ODDS AND ENDS.

WELL-KEPT gravel drives and paths are as essential to the surroundings of a beautiful country house as well-kept lawns, and both entail no little labour. A new weed-killer in either powder or liquid form, "The Eureka," is brought to our notice by Messrs. Tomlinson and Hayward, Limited, of Lincoln. They claim that it is most effective, whilst the cost of treating 100 square yards is only about 1s. 6d.

—o—

THE Atkins Filter Engineering and Water Softening Company, 74, Southwark Bridge Road, S.E., call attention to the report of the last Royal Commission on Water Supply, in which evidence was given tending to prove the superiority of soft water over hard for household purposes. This firm supply all kinds of apparatus for softening water, and have already many country houses on their list in which it has worked satisfactorily.

—o—

THE British Vacuum Cleaner Company, Limited, whose machines are becoming so familiar to everyone at spring-cleaning times in London, have just shipped two to Alexandria for use in the Royal Palaces of His Highness the Khedive, while they also inform us that enquiries are being made about them on behalf of the Japanese railways.

MODES AND MOODS

I HAVE been studying lately that class of human animal whom the Germans expressively call a "backfisch," and who in English is known by various designations, such as tomboy, filly, or minx, as the case may be; and I have come to the conclusion that the explanation of the indifference which characterises the majority of Englishwomen as regards their hair is directly traceable to the way they are allowed to neglect it as young girls. "As the twig is bent, so the tree will grow," and how can you expect a girl suddenly, almost from one day to another, to know how to dress her hair or show it to its best advantage when she "comes out," if from her babyhood she has been allowed to neglect it? Where I have been staying during the Easter holidays there were a number of "backfisch" of various ages, from seven to seventeen; they all possessed a most liberal allowance of locks, and there was not one among them whose hair was in the least attractive. The untidiness of those heads was appalling; hair "streeling" down their cheeks, over their ears (necessitating that most characteristically minx-like action, the "toss" of the head, at every moment), into their eyes, unkempt and uncared for. As I do not like the idea of an addition of floating hair in my soup or in my butter, I was careful to avoid the neighbourhood of a "backfisch" at meal-times; but the sight of these loose, unclean locks at table, even at a distance, was not appetising. These young girls had evidently never been taught to care for their hair; it hung lankly together, it had neither gloss nor sheen, it was of uneven lengths, and had manifestly but the most inadequate acquaintance with a brush. Now why should this be allowed? One does not see young girls on the Continent brought up to neglect one of the greatest attractions they can possess. If these young English maidens had been French, their hair, instead of hanging "just anyhow," would have been suitably and becomingly arranged; the fore part would have been caught up on the top of the head with a bow of ribbon, from which it would have been loosely plaited, or else it would have been merged in the heavier plait of the rest of the hair, which would hang down the back, with a bow at the end to match the other bow on the top of the head. The hair would be well brushed and glossy, and would not cause anyone qualms by falling into the soup; the girl would look smart and well groomed, which English young girls, as a rule, do not look; and, besides, she would thus be trained in the idea of the necessity of her head being neat, and her hair properly attended to. English girls have unusually beautiful hair, but they are often most extraordinarily careless about its treatment and appearance, and I believe it is all owing to the way they are brought up in this respect. You cannot allow a girl to grow up with the habit of having her hair hanging in lank wisps about her ears and cheeks, recalling the greasy ear-curls of a Polish Jew, and then suddenly, at sixteen or seventeen, expect her to appreciate the necessity of a neat head and burnished hair Personal neatness and attention to detail is a habit, and cannot be successfully acquired in a week, or a month, or even longer;

WALKING DRESS SKETCHED AT ERNEST'S.

and the indifference to hair-dressing of the average Englishwoman is, I am certain, due to the unpleasant way she is allowed to wear her hair as a child and young girl. She will spend guineas galore on hats which are created by artists for well-dressed heads of hair, and will be vaguely surprised that somehow they do not look as well as she expected on her own neglected locks. Picturesqueness in children is a British fad, but it is often only another name for untidiness, especially as regards hair; and the "picturesque" child often grows into the untidy girl and the "floppy" woman.

In spite of recent cold "snaps," which made us shrink back into our furs, the season is advancing, and it is well to look around for lighter clothes than those we have been wearing in this chilly spring. A charming "intermediate" dress is that illustrated on the previous page, which is one of Mr. Ernest's latest creations. It is of dark blue alpaca, extremely simple in design, but full of that quiet distinction which always characterises Mr. Ernest's dresses. The skirt is almost plain, except for a scallop and a deep tuck round the hem, and, again, a little higher up. The little bolero is charming, with its double curved fronts, held by single gold claws here and there, and opening over a beautiful waistcoat of ribbed white silk, with a heavy gold embroidery, like that on the coats of diplomats, outlining the edge. This embroidered waistcoat gives a remarkably rich effect to the otherwise severely simple gown. The sleeves are very original, with a rucked piece down the outside of the arm, enclosed between the plain pieces which keep the outline of the arm defined. To wear with this excellent costume is a charming hat in deep blue straw, of the French Breton sailor shape, trimmed with fringed scarves of soft blue silk, and a mass of shaded cornflowers in all tones of blue. On anyone blessed with golden or auburn hair, this hat and dress would be a delight to the eye, and would be equally appropriate to wear in either town or country. Another of Mr. Ernest's designs which is immensely and deservedly popular is his three-quarter coat in white serge or white alpaca. The back has broad folds, which are held to the waist by a band that starts from each side passes under the arms, and disappears under the fronts, leaving them to hang straight from neck to hem. These fronts button back at each side, with round gold buttons if the coat is worn open, thus making a most ornamental finish; or they can be crossed and the coat buttoned double-breasted. In cream white alpaca, this coat is quite charming, and smart enough for town wear if desired, though it would look its best, of course, on the deck of a yacht.

With the word "May" on the calendars and newspapers, proving to us that winter is over and done with, our thoughts turn to shirts and blouses, for they are things we can seldom do without when the time has come for abandoning furs and winter garments. Those in need of these necessary articles should betake themselves to Messrs. Shoolbred's; but they should go when they have time in hand, for the choice of shirts and blouses at Messrs. Shoolbred's is the most bewildering one I have ever seen. Their tailor-made shirts have met with such well-deserved popularity that the firm has broken its own record this year in the amazing quantity and variety of patterns which it has provided for those who desire these delightful accessories to a tailor-made frock. Nothing looks so bad as an untidy blouse with a severely-plain and workmanlike tailor-built gown; nothing looks so well as when this indispensable dress is finished by a shirt of equally impeccable build and design. All Messrs. Shoolbred's shirts are cut and made by men in the Men's Shirt Department, so that an absolutely-workmanlike effect is guaranteed. This beauty of cut and workmanship does not add to the cost of the shirts, for many of the most charming examples are made to order at 11s. 6d. There are over 2,000 patterns of delaines, Oxford and Newmarket shirtings, mercerised and silk zephyrs, Indian gauze, and silk mixtures for the happy but somewhat bewildered visitor to choose from; and best of all is Messrs. Shoolbred's delightful specialité "Japleen," which combines the brilliant appearance of Japanese silk with the washing and wearing properties of an ordinary zephyr. There are innumerable varieties of designs in Japleen, and nothing could be prettier than the series of delicate colours with round white spots (such as in the accompanying illustration), or diamonds in blue, grey, pale green, black, and white. Fancy stripes, too, are much to the fore, and, when made as Messrs. Shoolbred's shirts are made, a design with stripes is becoming and charming, though I have seen nightmare shirts elsewhere, in which the stripes met, as the Scotsman jokes, "wi' deeficulty." These Japleen shirts, in any design, are made to order for 11s. 6d., and a better investment for the coming summer months than half-a-dozen of these shirts would be hard to find. Silk zephyr shirts can be made for 13s. 6d. apiece, and the Newmarket shirtings may be recommended as both serviceable and smart. Another charming material is the "Nette" shirting, which has a canvas ground of pale colour and stripes in white and colours, or can be had in all white. When anything so important as shirts is contemplated, it is, of course, best to pay a personal visit; but those for whom this is not possible can write to Messrs. Shoolbred, Tottenham Court Road, W., for patterns, of which an immense selection will be sent, with a form for self-measurement, which is so accurately yet simply drawn up that a perfect fit is guaranteed if the instructions for measurement are followed. Those of my readers who go to Messrs. Shoolbred's in person should make their visit doubly profitable by paying a visit to the linen department, where there is a stock of Irish hand-loom linen on sale at most exceptional prices. This hand-loom linen is extraordinary for its wearing quality, and this, allied to its beautiful appearance and texture, makes it beloved by all good housewives who take a proper pride in their linen-closets. To return, however, for a moment to the shirt and blouse question, it may be as well to warn my readers that more white than ever is going to be worn this year. White shirts with short skirts of white serge or white hopsack for morning wear; white blouses of embroidered muslin and lace, or embroidered linen with skirts of greater length and elaboration in muslin, crêpe de chine, or eolienne; white "fronts" of beautiful old lace and knots of Pompadour ribbons to lighten up darker dresses—white as a dominant note will be worn at all times of the day. This is news to be welcomed heartily, except on the ground of expense for washing, cleaning, and replacing; for it is undeniable that nothing suits both young and old like plenty of white round the face. What makes every sister of St. Vincent de Paul appear possessed of an exquisite complexion? The wide-spreading white cornette that sets an aureole of white around her head and shoulders; and the lovely caps of delicate old lace that our grandmothers so wisely wore, with fichus of filmy muslin and lace ruffles at their wrists, could anything have been more becoming? Therefore let us welcome the rage for white that promises to be the feature of the coming fashions; or at least let us not fail to adopt it to the extent of having plenty of white showing round our necks, for every complexion is heightened and improved thereby, and the air of fresh cleanliness it gives to those among us who have to live in grimy London is of itself an attraction.

Every woman who is thinking about her clothes at this moment—and what woman is not?—should send for Messrs. Dickins and Jones's new catalogue of summer fashions, which is quite the most complete thing of the kind I have ever seen. Every description of dress, from the most elaborate to the most severe, of cloaks, of chemisettes and blouses, of every garment or dress accessory the most particular woman can require, is illustrated in the pages of this delightfully bulky and most interesting volume, a careful perusal of which will very greatly lighten the problem of shopping. For the further convenience of their customers Messrs. Dickins and Jones have opened commodious luncheon-rooms, where hot and cold luncheons and afternoon teas are served in the most comfortable way, and at most moderate prices.

Referring to complexions and London grime, I hope that all my readers have been laying in a store of Dr. Dys's famous Sachets de Toilette and Sève Dermale before the season's rush is upon us, for nothing preserves the one and counteracts the effect of the other so well as the daily and nightly use of these admirable discoveries of the French specialist who has devoted his life to make woman's chief beauty, the radiance of her complexion, impregnable against the assaults of the great destroyer, Time. Dr. Dys sets his face resolutely against all "make up"; and his disciples may also adopt this superior attitude, for the velvety rosiness of skin which is attained by the constant use of these two chief specialities of his, needs no artificial heightening. He has many other things of excellence in his Arsenal of Beauty, such as his greaseless cream Dysaline, his Lotion Supra, his Rosée de Beauté, and his soap and powder, all of guaranteed purity and efficacy for the preservation of the skin; but first and foremost I place the Sachets de Toilette and the Sève Dermale, which I have used for years and would not be without on any account. Occasionally it has happened, when travelling, that I have run out of my Sachets, and I find a difference at once when I have not one of them to turn the water of the hand-basin into a milky, rosy lotion, which refreshes the skin in a wonderful way Those who have not yet made acquaintance with these invaluable toilet articles should write to Dr. Dys's sole agent, V. Darsy, 54, Faubourg St. Honoré, Paris, who will send a descriptive booklet and all particulars. LAMIA.

SHOOTING NOTES.

THE SPRING FIELD TRIALS OF POINTERS AND SETTERS.

FOR the whole of the last forty years the younger generations of shooters have learnt that dogs are going out of use, but, at the same time, the field-trial societies have been increasing in numbers, and their events attract more and more entries. This year, for instance, the National Society has had a best on record of young dog entries, and the attendance has been attracted from the furthest away of British possessions, as well as from foreign countries, including America. In reviewing the work of the dogs this year I propose to take each class of competition, and to follow the fortunes of the dogs engaged in them from the first to the last trial.

A start was made by the Gun-dog League with its annual Brace Stake. It was so badly contested that Mr. Smale and Mr. W. B. Austin exercised their undoubted powers withholding the chief prize. But this is hardly good business, for as no limit has ever been discovered to the badness of scent, so no arbitrary limit of bad work can be fixed, beyond which good dogs may not descend by force of circumstances. The danger of such verdicts was seen when, at the Kennel Club meeting immediately following, and with one of the same judges, the same dogs obtained the chief prizes in the Equivalent Stake. In the International it was Mr. A. T. Williams's Rock and Ruby of Gerwn second, with Mr. W. Arkwright's Diarmid and Lay third. In the Kennel Club Trials Mr. Arkwright's Diarmid and Lay were first in the Brace Stake, and the discredited Rock of Gerwn actually beat all the old dogs in the Single Stake, and won first.

The following week the brace work was improved upon by the advent of a brace of great slashing puppies, namely, Mr. A. N. Hall's Gruiniard Dash and Spot. But it was natural quality they won on, and quite rightly, too; for the circus business should only be rewarded when it is added to the highest natural qualities, and should be of no avail to set off moderate ability. At the National Trials, which rounded off the spring series, and where the competition was much higher generally, the Brace Stake was again only moderate, so much so, that again a pair of puppies could win; these were Mr. Nicholson's brace of setters, Rubina and Rural Life. The former also won in the Setter Puppy Stake, and although she is a very handsome little blue belton, she is of wholly inferior calibre to Mr. Hall's dogs mentioned above. Mr. A. T. Williams's brace are highly broken, but were outclassed at the later trials of the month.

The Kennel Club Derby for young pointers and setters had three pointers at the head of affairs. These were Mr. B. J. Warwick's Compton Rector, Captain A. Stirling's Kitty Keir, and Mr. Sawtell's Melksham Sprinter. At the English Setter Club's Trials these dogs appeared again, but competition gained in strength, and although Rector was once more first, it was in defiance of a rule of the society which insists on first and second winners being run together before prizes can be awarded. The winner there of second was Colonel Cotes's Pitchford Bloom, a handsome young pointer that followed up this excellent beginning by defeating Rector at Shrewsbury, getting first money, and then beating the winning setter, Rubina, and so becoming champion puppy of the year. The second best young setter was a fine, fast game-finder belonging to Captain H. Heywood Lonsdale. The third, named Glory of Lyndhurst, is the property of the Hon. G. Lascelles; and the fourth, named Glimmer, is one of Mr. Herbert Mitchell's Lingfield lot. Following Pitchford Bloom amongst the young pointers were Captain Stirling's Keir Kestrel second, and Mr. E. Armstrong's Glaizdale Sis third, this last-named animal being remarkable as the result of breaking by a man of seventy-four, and a forty years' attendant at these trials. There certainly was no better broken one in the stake. Fourth at the National was the same pointer puppy that had won everything at the two previous meetings, viz., Mr. B. J. Warwick's Compton Rector. As much better work is usually expected from aged dogs than from puppies, it was a surprise to see how badly the six last in the stake performed at the Kennel Club meeting.

Up to the time of their selection they had performed well, but, when it came to placing the winners, it was a question of the least worst. An exception can be made in favour of the winner, Mr. A. T. Williams's lemon and white setter, Rock of Gerwn; but Mr. Warwick's Compton Pride left game behind, and also refused to back. Mr. F. C. Lowe's Grant of Bobbing, a big winner of last year, did less wrong and more right, but only got third place. The fourth was gained by one of the only two Irish setters at the trials this year. This was Miss Amy Stobart's Pepper Judy. This form was not good enough for the following trials, as the English Setter Club Stake was won in fine style by Ightfield Duffer. This is a very fine worker, and had for its principal competitor a pointer named Pitchford Duke, belonging to Colonel C. J. Cotes. Perhaps as good a trial as seen at the meeting was one run by Pitchford Ranger, in which Pride once more showed her indisposition to "back." The award was to Ightfield Duffer first; Compton Pride and Pitchford Duke divided second and third.

At Shrewsbury the National Society provide two stakes for aged dogs—one for non-winners, and the other for champions or previous winners. The first of these was won by Mr. Elias Bishop's Bang Pedro, a highly-broken pointer, second in this event going to Mr. Murgatroyd's Humby Madge. The aged setters in this stake were not a very fine lot. Miss Bibby won with a partly-broken dog, the others having been short of game-finding ability.

This brought us to the final stage of all, the Champion Stake. Colonel Cotes's Pitchford Ranger fairly smothered the crack setter of last year, Mr. Llewellin's Countess Carrie. Then Pitchford Duke eclipsed the chances of Mr. A. T. Williams's Rock of Gerwn, and Captain Lonsdale's Ightfield Duffer had very little the best of it with Pitchford Bang. Mr. Llewellin's very old Kitty Wind'em had to give way to Mr. Warwick's puppy, Compton Rector, and Mr. Bishop's pointer, Bang Pedro, disposed of the chances of Mr. Warwick's twice champion, Compton Pride. This was once through the card except for the bye dog, Mr. Sawtell's Melksham Bragg. With him Colonel Cotes's Pitchford Ranger ran a faultless trial. Afterwards, Pitchford Duke took all the points in a trial with Ightfield Duffer. Mr. Elias Bishop's Bang Pedro and Mr. Warwick's Compton Rector both poked up birds, which was not good enough for the company, so that Mr. Sawtell's Melksham Bragg was called to run with Colonel Cotes's Pitchford Duke. Although Duke had gained all the points from the great Duffer, Bragg completely out-pointed him; so much so, that the trouble was to get a point for Bragg to back before giving him second prize. Colonel Cotes's Pitchford Ranger took champion honours very easily by virtue of his previous run with Melksham Bragg. G. T. TEASDALE-BUCKELL.

WILDFOWL IN FRANCE.

THE institution of a close time for water-fowl in France is an admirable measure, and one that may have a good effect on the stock of fowl coming to our own shores; but the change of date for the commencement of the close season, which is now announced, is a little surprising, and rather apt to rob the measure of much of its possible usefulness. The date originally contemplated for the beginning of the close time was March 31st. A later announcement of the Minister of Agriculture was to the effect that the close time would be postponed until April 23rd. But many of the fowl are such early nesters that much of their domestic business is begun well before this. The provision will apply to twenty departments.

ROEDEER.

The marked increase of roedeer in Dorsetshire, and the addition which these pretty little bucks make to the bag in a day's covert-shooting when a few are killed, suggest the question why they are not more generally introduced and preserved. They are a beast of the moor and heath in North Germany quite as much as of the forest, and any good sportsman there will tell you whether a carcase is that of a "moor buck" or of a forest-bred roe. Roe wander very little. The buck has a regular haunt which he never leaves, and where he "stands" for a time every evening before feeding, at which time the German sportsman stalks him with a rifle in proper form.

THE LION'S STRENGTH.

Further accounts of the fatal lion-hunt in Kathiawar show that Major Carnegy was killed by a single blow on the left shoulder by the lion's right paw The fearful strength latent in the mass of muscle which coats the forearm of the great felidæ is again shown by this deplorable accident. A native hunter, a servant of a French merchant at Khartoum, landed from a steamer to shoot a lion which he saw on the Nile bank. The man advanced bravely with a single rifle, and fired. The answer was an instant charge, and the lion struck the man on the shoulder. "The effect was awful," says Sir Samuel Baker. "The man was dashed violently to the ground, and the lion fell across his body; after a few gasps it also rolled over and died. The hunter never moved. The steamer was then run alongside the bank, and Mr. Lafargue, with a number of men, went ashore. Both the man and the

lion were quite dead. The bullet had struck the animal in the chest and had passed through the heart. The hunter's arm was hanging from the hip. It had not only been completely dislocated at the shoulder by the blow, but it had been torn or struck downwards with such extreme force that the flesh had been entirely stripped from the ribs and the side; the arm at the extremity of this ruin was lying on the ground, hanging only to the hip by the flesh attached."

AMMUNITION.

Kynoch's Journal, which deals mainly with guns and ammunition, contains in its present number some useful chapters on the history and manufacture of the cartridge. The writers disagree with a contemporary, which says that the pressures of military cartridges are generally put at some 30 per cent. too high, and that the German military cartridge only gives a pressure of 15·5 tons instead of 20 tons. The German reports give the pressure at 20·5 tons, and other military cartridges, by the Kynoch tests, conform pretty closely to the figures claimed for them. Of more general interest is the great difficulty experienced in getting the brass of cartridge-cases to be of a uniform small crystalline grain, though the greatest pains are taken to examine the structure of the ingots of brass used for the cases. The workmen, too, are very carefully trained to use their own eyes in inspection and testing. Brass is one of those metals which are useful but never quite satisfactory for any purpose.

A NEW LIGHT ON LIONS.

Sportsmen and naturalists alike will read with the liveliest interest Captain Crawshay's paper on "The Field Natural History of the Lion," just published in the Proceedings of the Zoological Society. The common opinion that the lion is an animal almost exclusively of nocturnal habits is, says Captain Crawshay, quite erroneous. "I have seen," he says, "lions at all times of the day, under all sorts of conditions, in all sorts of country, in all sorts of weather, from misty rain to the hottest noonday sun of the tropics." How hot the sun can be in these regions will probably surprise even travellers, judging from a description of the author of a lioness which he watched "crossing the bare scorching lava-coloured plain . . . in the fierce heat of noon at midsummer, with the heat radiating in lambent tongues from the ground, giving her the appearance of being enveloped in fire." And he goes on naïvely to remark, "Nothing had disturbed her, as this country was uninhabited by man; she was making her way to the water." Very naturally! That the lion is, indeed, protectively coloured we may gather from an instance which he quotes, where he passed within twenty paces of one without being aware of the fact, though there was "nothing whatever intervening between us but the bare fire-swept ground. He did not catch my eye as he lay in a black patch of shadow—so black that when the man afterwards pointed him out to me from above, and not in relief, I could not make him out." As to man-eating lions, Captain Crawshay does not believe that this is the last resort of very old animals. On the contrary, he believes that he acquires a taste for human flesh in the first instance, under the impulse of hunger or passing caprice, and "having thus overcome the natural repugnance and instinctive fear which all the lower animals have for man, finds in him an easy victim, and henceforth constitutes him his especial prey." Lions, it would seem, are by no means fastidious feeders, inasmuch as they will eat putrid meat greedily. On one occasion, indeed, one of these animals ate the skin of a sable antelope dressed with arsenical soap! That the lion will occasionally vary his diet with the flesh of porcupines seems evident, from the fact that portions of the quills of these animals have been taken from the pads of the destroyer by Captain Crawshay.

RACING NOTES.

QUITE a remarkable feature in an exceptionally busy week has been the success at the Manchester Meeting of horses trained by Coulthwaite, the Hednesford trainer, five races on the first day and three on the second falling to their share. It is only fair to mention that to the brilliant riding of F. Mason, who steered them all to victory, not a little of the Hednesford luck was most certainly due. Another extraordinary performance during the Easter week was that of Mr. W. Bulteel at the Torquay Steeplechase Meeting, where he rode five consecutive winners on the first day, and on the second had four winning rides, and finished second in his fifth attempt, making a total of nine winners in two days out of the ten races in which he took part. This is certainly a very remarkable performance, and, speaking without book, both F. Mason's series of winning rides at Manchester and Mr. W. Bulteel's succession of victories at Torquay are record performances.

It is impossible to deal in detail with the vast amount of racing which took place all over the country during the past week. It may be of interest, however, to point out that the winning form of the season, as far as it has gone, is working out in a fairly satisfactory fashion, and to notice especially that the Brocklesby form appears to be considerably better than it was considered to be at the time, and it will be no surprise if the winner of that race should prove to be a really good horse. Such animals as Glenamoy, the Lady Lena colt, Ravilious, Sweet Mary, and others must have amply repaid those backers who had made up their minds to follow the "book," while Colonel Wozac and Pharisee have supplied a further proof that if horses are capable of standing a searching preparation they will not flinch when the final struggle for victory has to be fought out to the bitter end.

W. A. Rouch. *BACHELOR'S BUTTON LEADS THE PARADE.* Copyright

Pharisee, the City and Suburban winner, if I remember rightly, was bought by "Ashplant" for Mr. Prentice to gallop with Pekin, who was supposed to have some sort of chance for the Derby, but the Grately stable found that there was no merit in him, and he was sold back again to Blackwell for considerably less than his purchase price, to undertake, amongst other labours, the onerous task of leading Rock Sand in his work. He must be an animal of exceptional soundness and hardy constitution, for he has never looked so well as he did on the City and Suburban day, and it is not likely that even his accomplished trainer can ever effect any further improvement on the form he showed in that race.

The Great Metropolitan Stakes, which was won by Long Tom, supplied yet another instance of how it sometimes happens that a horse may eventually fall into the hands of a trainer who, for some reason or other, finds him to be possessed of qualities which others have entirely failed to discover. Drafted out of the Kingsclere stable, Long Tom had a varied and chequered career; he passed through many hands, and descended to the ranks of the selling platers over hurdles, and was finally bought by Woodland for a little over £100, and passed on by him to his present owner for a profit of £10 on the deal, a transaction which Escott has no reason to regret. Last year the rich Sandown Park Produce Stakes was won by Vedas, and, by a somewhat curious coincidence, last week the race went to his own sister, Gemma, bred and owned by Lady Meux. The daughter of Florizel II. and Agnostic is a beautiful filly of great quality and extremely bloodlike appearance, and does not seem to have any trace of the wayward character of her brother. She is, perhaps, a trifle light of bone, and some exception might be taken to her feet, but she was clearly the best of her field, and plenty of races should fall to her share. While on the subject of Sandown Park, it is somewhat singular that at such a meeting more care should not be exercised in the revision of the race-cards issued to the public. It cannot be said that the colours of the Duke of Westminster are not well known; and it is difficult to understand why against the name of Rydal Head in the Esher Handicap Stakes colours other than those of the owner should have been substituted for those of the Duke of Westminster.

At Kempton Park on Easter Monday thousands of people assembled at this always-popular meeting to witness the race for the Queen's Prize, for which just a dozen horses went to the post, including Glenamoy, with a 7lb. penalty, and Sansovino, who was penalised to the extent of 14lb.; and the handicapper's opinion of their respective merits would seem to have erred considerably on the side of leniency, for, in spite of their penalties, they finished first and second respectively, and the performance of Glenamoy may be even better than it looked, for he was not a little hampered by the attention of Gold Lock, who hung towards him when beaten. Lord Falmouth's colt by St. Frusquin out of Cereza won the Rendlesham Two Year Old Stakes in very good style, and should be heard of again.

The ordinary fare to Epsom and back, first class, from Victoria is 3s., and it does seem somewhat strange that the railway company should charge 8s. 6d. for the same journey on a race day. In any case, this exorbitant charge would appear far too heavy; but the grumbling would have been less if some compensation had been given to passengers in the shape of increased comfort and acceleration of travelling. Neither of these, however, was forthcoming. I sincerely hope that those who have not already given in their adhesion to Lord Carnarvon's proposed memorial to the Jockey Club on the subject of railway charges to racing folk will take notice of this and other kindred matters.

The very disagreeable state of the weather no doubt accounted for the somewhat scanty attendance on the opening day of the Epsom Spring Meeting, but as far as the racing itself was concerned there was no cause for complaint. Proceedings commenced with the Tattenham Plate of 200 sovs., in which Mr. D. Clarke's chestnut filly Sweet Mary, by Cyllene out of Auricula, again

showed a clean pair of heels to her field, and won in a canter by four lengths from Mr. L. de Rothschild's Croisette. Just a baker's dozen went out for the Great Metropolitan Stakes, which is always an interesting race to the public, both on account of the distance of 2¼ miles over which it is run and from the peculiar shape of the course, in which the advantage of station is changed during the progress of the race, the sharp bend to the right in its early stages being compensated for later on by a similar sweep to the left. For nearly two miles the leading lot, consisting of Alderman, Long Tom, Sandboy, Solano, and Pure Gold, took part in the fighting; at the top of the hill Pure Gold and Long Tom held a slight advantage, with Sandboy and Solano close up. As they swept into the straight Karakoul challenged on the inside and Caro on the outside, but their efforts were of no avail, and Long Tom, striding along at

W. A. Rouch. *PHARISEE, WINNER OF THE CITY AND SUBURBAN.* Copyright

a great pace and with the utmost resolution, romped home a gallant winner by four lengths; Karakoul was second, and Caro third. In addition to the satisfaction of having converted a selling plater into a winner of a race of such importance, Escott had the further pleasure of seeing his horse ridden to victory by his son, C. Escott, who has but lately returned from South Africa. Those who were not satisfied with the sport provided at Epsom on Wednesday must, indeed, be hard to please, the race for the City and Suburban in particular being of exceptional interest from every point of view. In the paddock previous to the race the air was full of rumours and gossip as to the probable winner of the popular handicap. Ambition, who had at one time been confidently expected by many good judges to defeat all opposition, was reported to have gone amiss, and the report was apparently confirmed by the betting; but one expert at least stood to his guns, and would not hear of anything else in connection with the race, and if half the wild stories put into circulation concerning Laveuse had been true, she would have won by the length of the proverbial street. When it came to inspecting the horses, however, there was no getting away from the splendid condition and business like look of Pharisee. Flower Seller and Palmy Days both looked well, the former especially so, and he should win a good race before long. Nabot I did not like the look of, and I am convinced that he is by no means at his best just now. Grey Green seems to get bigger and more lusty the more he works, and whatever may be the racing merits of Dean Swift, he is anything but taking in appearance, being an exceptionally hairy-heeled and common-looking animal. Ob, the representative of France, is a useful, sturdy sort of colt; he lacked nothing as far as condition went, and had the advantage of being ridden by G. Stern, but a mile was about the length of his tether, and he had nothing to do with the finish of the race, for which nineteen horses went to the post. The light was none too good, but as far as one could see, Dean Swift and Nabot jumped off when the barrier went up, with Ob close on their heels, for about half a mile, when Ambition took up the running in earnest, and striding merrily along, maintained his place in the van till nearly halfway up the straight, when Maher brought up Pharisee with a rattle; but Ambition was by no means done with, and, fighting his race out resolutely enough, was only beaten by half a length. Dean Swift ran well, and finished third, a length behind the second. That Pharisee ran a great race there is no denying, but he owed his victory to the splendid condition in which he was turned out by Blackwell, and to the artistic riding of his jockey D. Maher. The meeting came to an end with the Apprentices' Plate, which went to Mr. L. de Rothschild's Falconet, by Gallinule.

Thursday, the 27th, found all things in apple-pie order at Sandown Park to welcome the good attendance present on the occasion of the inauguration of the new 1½-mile course, over which the Esher Handicap Stakes, with its added trophy, was run. The silver-gilt tankards and the bowl, which constituted the *objet d'art*, became the property of Mr. J. B. Joel through the victory of Ravilious, who thereby followed up his success in the Copthorne Handicap Plate at Epsom. Mr. G. Thursby just got home by a head on his own filly by Prisoner out of Fairing in the Juvenile Selling Plate. Try as he would Imperial II. could not give the weight away to Cape Verde, who was returned a very lucky winner of the Princess of Wales's Handicap owing to Saxby, on Early Bird, making a mistake as to the whereabouts of the winning-post; and the unexpected victory of Signet in the Cobham Two Year Old Plate added to the confusion of backers and supplied another instance of the futility of racing over four furlongs. On the following day Galgreina maintained the reputation of Gallinule as a sire by winning the Tudor Plate. In the Walton Two Year Old Selling Plate Mr. C. Bewicke's filly by Ayrshire out of The Rouken squandered her field and won easily by four lengths. The Sandown Park Stud Produce Stakes has already been alluded to, and Best Light, by winning the Twickenham Handicap, drew renewed attention to Mr. Henning's stable and the chances of Rouge Croix in the classic races of the year.

Saturday, the concluding day of the meeting, may be looked upon as the close of the jumping season, and was mainly noticeable for the continued success of horses trained by Coulthwaite, who accounted for three races during the afternoon, thus completing the extraordinary record of eleven wins out of the twelve races for which his horses had started during the week. The Grand International Steeplechase was easily won by Mitchelstown, ridden by F. Sullivan. TRENTON.

ON THE GREEN.

SOME while ago I fell into quite a lot of trouble by saying of a certain golf links, which shall be nameless for the moment, that it was the most picturesque in the world. It shall be nameless, because I now have to put it into the second place, at best, for picturesqueness. I fell into trouble because everyone else who had any interest in any other golf links wrote abusing my judgment, and saying that his own was the most beautiful in the world, which is quite the right spirit in which to take the world in general and everything to do with golf in particular. Quite lately I have played on a green, newly opened, on the island of St. Mary's, one of the Scilly Islands. This, beyond possible dispute, is the most beautiful in the world. Golden gorse, blue sea, seascape studded with islands all round—these are the elements of its beauty; and you may compare the picture of them with as much imagination as you please; you cannot beat the reality. Here, with hazards of gorse and of the stone walls which the islander, for reasons best known to himself, calls "hedges," a course of nine holes has been laid out, and a club has been formed, by the name of the Isles of Scilly Golf Club. A cup has been given by Mr. Dorrien-Smith, Lord Proprietor of the Islands, besides other prizes, of which I had the personal honour to win one that was given by the captain of the club and really the chief inspirer of the whole undertaking, Dr. Brushfield. All the holes are interesting, and the greens are very good, considering that the course has only been redeemed from unmitigated gorse within rather less than a year. The approaches to the greens want a little attention, which it has been promised to give them, and when that is done the golf will be a much more true test of form.

The remark that golf is a queer game is a very commonplace one, but it would have received very remarkable evidence indeed in support of it if Cambridge had not beaten Oxford this year. On the public form Cambridge looked like having a decided advantage, and in Mr. Hoffmann an unusually formidable player. On the other hand, it did not look as if the advantage ought to be as heavy as the result indicated. The win, by fifty-eight holes to three, was a wonderful one. It was the turn of Cambridge to score a victory, for she has not won the Inter-University golf match since 1898, and Oxford is still two ahead on the balance. The only man on the Cambridge side who was down at the end of the first round was Mr. Martin Smith, four down at that point to Mr. Rathbone, but he must have played a very fine round in the afternoon, holing the difficult and long Sunningdale course in 76. He turned his four holes down into three holes up. Mr. Hoffmann's second round was also 76. The only winner for Oxford was Mr. Gordon, put in, I believe, at the eleventh hour as a substitute, who scored the three holes which were all that Oxford had to her total credit. Of course, Mr. Hoffmann gained a great deal of renown by beating Mr. Ball in one of the matches of the Oxford and Cambridge Golfing Society's tour, and being beaten by him by a single hole only in another match of thirty-six holes. At that time it was said that Mr. Ball was not playing up to his proper form. How that may be I do not know, for I did not see any part of either performance, but it is quite certain that both before then and since Mr. Ball's game has had nothing the matter with it. He played an extraordinarily good round at Leasowe in a competition just before those matches with the University people, and at Hoylake quite lately his score of 77 on a bad day was not only a good one, but it was by four strokes better than any other man in the field could do. It was not a bad field, for both Mr. Graham and Mr. Hilton were in it; but the second best to Mr. Ball was Mr. J. Crowther, with 81, beating both Mr. Graham and Mr. Hilton by a stroke. At Westward Ho Mr. Osmund Scott has been invincible, as usual, for the scratch prizes, and the handicappers had to work hard to keep him out of first place on the handicap list too.

All these and other good performances of various good players seem to make the life of a selector of the English team for the amateur international match not altogether a happy one. There is always comfort in the reflection that the task of the Scottish selectors will be no less difficult. There is, perhaps, an equal embarrassment of riches on both sides of the Tweed. HORACE HUTCHINSON.

Hall's Sanitary Washable Distemper

Perfection in Distemper

is attained in Hall's Sanitary Washable Distemper, because it is unaffected by light, heat or damp; is washable, does not crack or peel off, and retains its true colour.

Hall's Distemper is the up-to-date wall decoration. It is pleasing to the eye and insures cleanliness. It is, when first applied, a thorough disinfectant and germ destroyer, and appeals alike to the artistic and practical side of house decoration.

The material is sold in tins and iron kegs and only requires water adding to be ready for use. It is of greatest utility for Estates, Farms, Agricultural Buildings, Out-houses, and for most purposes where oil paint is usually applied.

CAUTION.—See name Hall's Distemper on all packages and refuse inferior substitutes.

Sample, shade card and full particulars from Sissons Brothers & Co., Ltd., Hull.

THE AUTOMOBILE WORLD.

By a regrettable coincidence the commencement of the spring months is not infrequently marked by an epidemic of motor-car accidents. The present year has, unfortunately, proved to be very far from an exception to the general rule, and the mishaps, which for a time were recorded almost daily in the columns of the newspapers, were more numerous and more serious in their character than has ever been the case in the previous history of the movement. Full advantage of these occurrences has been taken by the avowed enemies of automobilism to endeavour to visit the sins of the few upon the great body of good motorists, and to bring discredit upon the motor-car as a means of locomotion because its powers are sometimes misused. We are far from seeking to minimise the gravity of the situation, as we recognise that genuine public opinion, which does not find expression in intemperate letters to the daily Press, has been strongly stirred by the events of the last few weeks. At the same time, it is only fair to examine the facts dispassionately and see how far they bear out the suggestion, so frequently made, that the motor-car is a dangerous vehicle, as a rule recklessly driven, and that the existing laws are insufficient to safeguard the interests of the non-motoring public.

In the first place, it must be remembered that the motor-car is no longer the comparatively rare type of vehicle that it was only two or three years ago. The last available official returns show that in round figures 40,000 automobiles had been registered in the United Kingdom up to the end of June last. That these numbers have grown enormously is patent to everyone, and some idea of the increase is afforded by the fact that the London County Council, which had then registered 3,619 cars alone, has just been given a new index letter, because the five-figure limit has been reached. We must, therefore, be well within the mark if we estimate that there are 50,000 cars and motor-cycles at present in regular use in this country. Taking their average mileage as equivalent to that covered by three times the number of horsed carriages and pedal cycles, one arrives at an amount of traffic that would be fairly represented by at least 150,000 vehicles of the older types. Indeed, it is highly probable that if the number and daily mileage of the automobiles in use in the United Kingdom could be ascertained, these figures would be largely increased. The moderate estimate that we have given, however, is sufficient to show that, in spite of the fact that the motor-car is the most easily controlled vehicle that uses the roads, a certain proportion of accidents is bound to occur, unless motorists of every class are to possess a degree of infallibility that is not expected of the rest of mankind. The only serious question is whether the total of accidents is such as to point to anything approaching habits of recklessness or want of skill among automobilists in general.

Last month, admittedly, witnessed an abnormal number of accidents, but, except in three or four notorious cases, there were no grounds for supposing that the motorist or his machine was in fault. Where fatal results ensued, the coroner's juries, which are drawn from a class generally supposed to be hostile to the motor, returned verdicts of "Accidental death," and exonerated the driver from all blame; and it is noteworthy that the police accepted the decisions without hesitation. Probably these cases would never have been recorded in the daily papers were it not for the fact that, a "motor scare" having once been started, every local reporter in the kingdom becomes keenly alive to the fact that any "copy" bearing on the subject is certain of acceptance by at least a dozen different sub-editors, and for a time is careful to let no incident, important or unimportant, escape his pen. We say it in no disparagement of that useful servant of man, the horse, but there is no doubt that, if the same minute record were made of his vagaries, the public would stand aghast at the unsuspected tale of daily victims.

Wakefield. MR. LIONEL DE ROTHSCHILD'S NEW SIDDELEY RACER. *Brentford.*
This huge machine is entered for the British Eliminating Trials, and will be driven by Sidney Girling.

Apart altogether, however, from the pure accidents, the relative number and significance of which have been greatly exaggerated, there remain several occurrences of an entirely different nature, which have excited widespread indignation among motorists and non-motorists alike. Even here it is only fair to suspend final judgment on the guilt of the offenders, as the cases are still *sub judice*, and it is possible that the sworn evidence, as distinct from the newspaper reports, may place a different complexion upon the cases. At the worst they will only prove that among the great body of motorists there are a few persons criminally indifferent to the safety of others. Two wrongs do not make a right; but as the Markyate tragedy, to take an instance, has been used as a weapon against the motor-car, it should be remembered that an exact parallel has more than once been recorded against drivers of horsed vehicles.

Perhaps of more serious import to the welfare of automobilism than the accidents, either avoidable or unavoidable, that have recently occurred, is the feeling that motor cars and cycles are too often driven without proper care and consideration for the safety and convenience of others. Taking the country as a whole, and including every class of driver, there is, unfortunately, little doubt that the instances of this sort of misconduct are sufficiently numerous to give some grounds for the

A POPULAR RENDEZVOUS ON THE PORTSMOUTH ROAD.

impression. On the other hand, no impartial observer will deny that the vast majority of automobiles are used in a perfectly proper manner, and that the minority of offenders is tending to become relatively smaller. We believe that the two classes of motorists chiefly to blame are the professional drivers, who, as a rule, are ignorant of, or indifferent to, the traditional courtesies of the road, and, in spite of repeated assertions to the contrary in the columns of the technical Press, the owners of abnormally high-powered machines, who too often appear to lose entirely all sense of speed. The matter lies mainly in the hands of motorists themselves. If the present agitation serves to draw their attention to the danger in which they stand owing to the sins of the few, it will, perhaps, have been a blessing in disguise.

The Automobile Club is doing excellent work in this direction, and the executive has reiterated its resolve to exercise its powers firmly and impartially whenever an undoubted case of inconsiderate or reckless driving is brought before its notice. So far as private persons are concerned, these powers only extend directly to its own members, and indirectly to the members of its numerous allied organisations. As, however, the membership of these latter bodies includes a considerable proportion of the aggregate of private motorists in the kingdom, the club's powers of social punishment are very considerable, so long as the public assist in bringing the offenders to book. Over the professional class the powers of the Automobile Club are at present somewhat limited, except in the case of those drivers who may at some future time desire to take part in a competition of any sort. Here the ability to punish is very real, as is evidenced by the suspension, announced in another column, of a competitor in the forthcoming Eliminating Trials. If, however, as we hope may be the case, owners insist on their men providing themselves with certificates from the Automobile Club, in accordance with the scheme recently inaugurated, that body will be placed in a position to control what is undoubtedly the most dangerous class of motorist, and the elimination of the black sheep will be speedily accomplished.

A MOTOR PICNIC.

THAT the unexpected usually happens is an axiom the truth of which few will deny. It was with no very definite object in view that I clambered wearily on to my bicycle one day recently, and set off whither the fates should lead. The presence there of a very fine new Panhard may have influenced me in selecting a certain house as my immediate goal; at all events, lunchtime found me eagerly discussing with my hostess the points of her new acquisition. Being myself in the transition stage between two cars, a new motor acts upon me like an irresistible magnet, and I eagerly availed myself of an offer to stay for lunch and join a picnic party in the afternoon. There are many forms of conveyance less agreeable than an 18 h.p. Panhard, with a huge double phaeton body and 10ft. wheel-base. After lunch a party of five (exclusive of the driver) prepared for the start. A troop of shaggy bears would have presented an appearance similar to our own, as we packed ourselves and an ample tea basket into the car. Though the sun shone in a cloudless sky, yet the wind had an edge about it which made us bless our warm coats before we had gone far. The dust had been laid by some showers on the previous day, and fortunate it was for us that this was so, for the entire motoring population of the country seemed to be out, determined not to miss such a glorious afternoon.

Bookham Common had been the site selected for the scene of the tea party, but a motor-car is apt to get over the ground in a surprisingly short space of time, and we found on our arrival that it was barely a quarter past three. Even the two schoolboy members of the party were not *quite* sure that they were already equal to supplementing a decidedly hearty lunch, so after assuring themselves that ammunition for a "fir-cone fight," upon which they had set their hearts, was not to be procured in the immediate neighbourhood, they were quite agreeable to prolong the round until we should arrive in a country better suited to their warlike operations.

It would be hard, indeed, to find more charming scenery than that afforded by the lanes and byeways of Surrey. On this sunny afternoon the whole country-side, with the new fresh green

ROYAL SIRDAR PNEUMATICS

The Motor News says:—
"Nipped tubes are a constant source of trouble, especially to a beginner. The Sirdar air tube gets over this difficulty. It is so canseled in a U-shape, so that when placed inside the cover it springs naturally into the crown of same, and so keeps clear of the edges of the cover, or the tools used for fitting purposes. It is essential, however, that it should not be partially inflated when the cover is being replaced. These tubes are made, if anything, larger than the inside of the cover, and when inflated are compressed both laterally and longitudinally, instead of being stretched as the ordinary air tube is. They consequently afford great resistance to puncturing material."

The Times says:—"Testimonials received by the Sirdar Rubber Company from the Straker Steam Vehicle Company after the 2,000 miles' trial of their petrol omnibus are of a very satisfactory character, and they have many others."

clothing the woods and hedgerows in a fairy mantle, and reflected from the mirrors of many a pool and lake embowered among the trees, was a sight to cheer us with the thought that winter was over and spring at last was come. Bookham, Fetcham, and the sleepy Horsleys were visited. In this bustling work-a-day age it is good to find within easy reach spots which give the impression to the wayfarer that time has but mellowed,

LADY WALKER OF OSMASTON ON HER 30 H.P. DAIMLER.

without marking them with the brand of change which has gradually destroyed the poetry in so many of our wayside hamlets.

Such thoughts as these passed through my mind, punctuated by speculations on the part of the boys as to the suitability of various localities for the commencement of fir-cone hostilities. It was not until we had passed the Hautboy at Ockham, and entered the Portsmouth Road at the foot of the rise outside Ripley, that the plan of campaign was fully matured. By the way, speaking of the Hautboy at Ockham, I always feel somewhat aggrieved that the curious chapel-like building, in which tea is served, has no history to match its appearance. It ought to date from Reformation times, and to be connected in legend with disestablished monasteries, instead of which, it is an arrant fraud, dating from 1864, and built for the purpose of receiving rents therein. However, it serves as an excellent tearoom.

We turned to the right on entering the Portsmouth Road, and then went down the track leading to the Royal Horticultural Society's Gardens. Some few hundred yards down, there was discovered a spot suitable for all purposes, and the car was backed into the rank grasses by the roadside, while all hands were told off to the task of preparing the contents of the tea basket. While the water was boiling the long-deferred hostilities commenced. The boys raged furiously together, so furiously that, one fir-cone having landed with great violence in my eye, and another in the butter-dish, the immediate neighbourhood of the tea was declared neutral territory, and an infringement of neutrality entailed loss of tea.

About this time our attention was directed to a coal-cart which had stuck in some soft ground at the side of the road The horse, having reviewed the position, was firmly of opinion that to pull the cart clear was not in the contract, consequently an armistice was declared, and we sallied forth to aid the hapless carter. By the time that the cart was free the tea was ready, and the boys had got themselves into such a state of grime from mud and coal-dust that they were thoroughly contented. The armistice was most effective, only one breach occurring, and even then, after a fir-cone had been removed from the jam, things quieted down immediately.

As soon as the tea things had been stowed away (there is a huge fortune awaiting the person who invents a machine for automatically packing up after a picnic), we got under weigh. The Portsmouth Road was simply blocked with cars homeward bound, and the crowd outside the Hut at Wisley was a sight to see. Our equipage attracted no small amount of attention as we sailed majestically past, one face at least wreathed in smiles of conscious superiority. I do not believe that I am really a snob, but I always experience a positive glow of pleasure in meeting friends when I am on a fine car, and I certainly had cause for

THE NEW HOTCHKISS RACER.
The motor of this car has a bore of 160m.m. and a stroke of 180m.m.

self-congratulation on this occasion. Panhards have not the reputation of being particular "flyers" on hills, but this one seemed in no way troubled by them. She simply tore up on her third speed, leaving everything behind in her rapid course. It was fortunate that there was ample accommodation in the back of the car, as the warriors kept up a little gentle sparring just to keep their hands in for future occasions. As I arrived home on my bicycle I decided that the day had turned out far more amusing than I had anticipated. H. C. L.

THE SIDDELEY RACING CAR.

PRESSURE on our space prevented our including in last week's issue the handsome photographs of the new Siddeley racer, which are reproduced on a previous page. This car has been built to the order of Mr. Lionel de Rothschild, and is entered for the Eliminating Trials in the Isle of Man, where, if one can judge from appearances, it should render an excellent account of itself. The engine, which is rated nominally at 100 h.p., is apparently of enormous size, and has all its valves arranged on the left side, the inlets being placed above the exhaust valves and operated by vertical rods and horizontal rocking levers. Both low-tension and high-tension ignition are fitted, the latter being of the coil and accumulator type. The three-point system of suspension is adopted for both the engine and the gear-box, so that all the main bearings remain unaffected by any strain to which the frame may be subjected. The clutch is of the multiple-disc type, and a flexible coupling is interposed between it and the gear-box. The latter gives three forward speeds and a reverse, the power being finally transmitted to the road-wheels by means of side-chains. The new Siddeley is said to have shown an extraordinary turn of speed during its trial runs.

THE BIANCHI AND LISLE CASES.

Last week the committee of the Automobile Club summoned before them Messrs. Bianchi and Lisle, two of the drivers nominated for the British Eliminating Trials, who have recently been fined for furious driving. The decision of the committee in the case of Mr. Lisle was that he should not be admitted to the Competitors' Register, subject to the matter being reconsidered when the appeal to Quarter Sessions had been heard, should Mr. Lisle apply for its reconsideration. The effect of this decison is to debar Mr. Lisle from taking any part in the Isle of Man trials. In the case of Bianchi, one of the Wolseley drivers, the decision was that "the committee, considering that this is the first case which has occurred under the regulation of July 4th, and that there has been no previous complaint against Mr. Bianchi, resolved that he be severely reprimanded and suspended for one month." As the Eliminating Trials are fixed for May 30th, Bianchi's sentence will not entail exclusion from that event.

THE RACE FOR THE MEDITERRANEAN CUP.

This contest, from Algiers to Toulon, is supposed to start on Friday of the current week, but whether it will do so is a matter of the gravest doubt. It has all along been intended that the order to go shall not be given until the meteorological stations on the Mediterranean announce that the weather has set fair. And, since that amount of precaution was intended in the early days when motor-boat-builders had a good opinion of themselves and their craft, it may be taken that any erring will be on the side of prudence, now that the Monaco Meeting has taught a few useful lessons. Up to then, motor-boat racing had gone all too smoothly, and French builders and designers had been so cock-a-hoop about their succession of victories over the sea (as witness the fact that a whole fleet of boats was able to cross the Channel last summer), that they had scouted the possibility of mishap; but all this is changed, and out of the fifteen entries for the Mediterranean Cup Race it is probable that there will be, at the utmost, seven starters. These will be:

Mercédès-Mercédès (Herr Jellineck-Mercédès).
Mercédès C. P. (Charley and Pitre).
Ouand Meme (the Duke Decazes).
Le Camille (Mme. du Gast).
Mab (Mr. Thubron).
Heracles II. (Société Heracles).
Fiat X. (F. I. A., Turin).

RELIABILITY TRIALS.
The best reliability trials are the experiences of customers. Read the following from "The Motor," January 31st, 1905.
POWER OF FOUR-SEATED CAR.
"Sir,—In a recent issue you state, in reply to a query of 'A.L.M.' (Bowden), that 8 h.p. is a very low power for a four-seated car, etc. Last year I purchased a Gamage car fitted with a 6 h.p. De Dion engine and four-seated tonneau. On several occasions I drove it from London to Brighton and back, taking all hills, with three heavy persons and myself on board. On another occasion a motor friend of mine asserted that a 6 h.p. engined car would not take a certain hill used for testing cars. I therefore took the trouble to try mine, and it went up quite easily. It is surprising what these little engines can do.—Yours faithfully, H.H."
A CUSTOMER WRITES:—
"I think my car (a 'Gamage') is the only small car which has run from Hampshire to the North of Scotland without giving trouble. We carried three heavy passengers and 1 cwt. of luggage. I consider the 'Gamage' a wonderful little car."
Genuine 6-h.p. De Dion Engine.

RUDGE-WHITWORTH

200,000 MILES OF HARD RIDING

is the yearly total of testing new Rudge-Whitworth Models before we think them good enough for the public.

200,000 miles of hard riding to test thoroughly every new feature we adopt, Not riding on prepared tracks, but on good roads and bad roads, uphill, downhill, and on the level, in fair weather or foul, and by day and by night.

Besides this all raw material for Rudge-Whitworths has to pass the ordeal of analysis and the microscope in the Rudge-Whitworth Laboratories.

These are some of the reasons why Rudge-Whitworths surpass all others in reliability, and why they are fully guaranteed in every detail.

The prices are as low as the quality is high. This is only possible because of the enormous scale on which Rudge-Whitworths are manufactured at the great Works at Coventry.

There are 70 Models of Rudge-Whitworths from

£5 5s. to £15 15s.

or by Easy Payments from 4/3 monthly.

They are packed free and carriage paid. From all Dealers or Rudge-Whitworth Ltd., Coventry, and Branches.

64-page Catalogue post free from **Rudge-Whitworth Ltd.** (Dept. L 1), **COVENTRY.**

GARRICK STREET, LONDON, W.C.; and at 26 RUE BERGÈRE, PARIS.

The American boat Gregory, now on her way from America, is not likely to arrive in time, as she is reported to be waiting for supplies at the Azores. The two Napier boats will not compete, whilst Dubonnet has also been withdrawn from the contest. The journey will be made in two stages, being broken at Mahon, where a day's rest will be allowed—and longer, if the weather should change.

A Stiff Hill-climb.

The Auto-Cycle Club's hill-climb, which takes place to-day (Saturday), is one of great importance. Thirty-eight machines have been entered, six of them being tricars. The hill is in the grounds of Blackdown House (Mr. F. S. Philipson Stow), near Haslemere, and it is nearly a mile in length, of an average gradient of 1 in 11, 380yds. rising at the rate of 1 in 8, whilst 250yds. have the exceedingly stiff grade of 1 in 4½—an exceptionally severe rise. The motor-bicycles have been divided into classes, according to the size of the engine, one being for machines the engines of which have a maximum capacity of 76 by 76, or its equivalent; one for machines not exceeding 80 by 80; one for machines not exceeding 85 by 85; and one for machines with engines of unlimited size. The last-named class has attracted entries from some twin-cylindered machines ranging up to 10 h.p., so some exceptional speeds should be witnessed. The tricars are divided into two classes, the first being limited to those with engines of a capacity not exceeding 85 by 85, whilst the other class is unlimited, but every machine in either class must be provided with a variable gear. The racing commences at 2 p.m., and Mr. Stow has kindly arranged that the public shall be admitted to witness the events, ample accommodation for the cars of visitors being provided.

The Scottish Trials.

We have received an advance proof of the programme of the Scottish Reliability Trials, which commence on Wednesday next, and continue for the remainder of the week. It is a bulky document of over fifty pages, and contains the rules and conditions, list of entries, instructions to observers, tables of distances, and very full notes on the itinerary, together with maps, plans of the hill-climbs, and other useful matter. Of particular interest is the chart of the Cairnwell hill-climb, which is likely to prove a very severe test for the smaller four-seated cars. The timed portion is about 1,200yds. in length, and includes the famous Devil's Elbow, an awkward double turn with a steepest gradient of 1 in 6·5. The pass is 2,200ft. above sea-level, and is said to be the highest road in Great Britain. To automobilists touring in Scotland, and using in whole, or part, the Scottish Reliability Trial route, this programme would be invaluable, and we are authorised to state that it may be had on application to the hon. secretary of the Scottish Automobile Club (Western Section), 59, St. Vincent Street, Glasgow, in exchange for fourteen stamps.

Items.

It is rumoured that the Swiss team will not take part in the Gordon Bennett race, as neither the makers nor the Swiss Club are prepared to share in the enormous expenses of organising the contest.

Among the many new tyres placed upon the market since the lapse of the famous patents, are those manufactured by the Imperial Tyre and Rubber Company of Brooke Street, Holborn. We understand that these tyres have been thoroughly tested, with most satisfactory results, and the firm are prepared to make special terms to anyone desirous of making a trial of their merits. The Imperial tyres are made with grooved square treads, and also with the ordinary round tread; the walls are of extra strength, and we are assured that the workmanship and material used are of the very highest class. The company also manufactures and fits the Imperial non-skid, a steel-studded tread composed of compressed fabric and rubber, for which it is claimed that, the attachment being rubber to rubber, there is no risk of the band leaving the tyre. The Imperial works are close to the offices of the firm, and customers will at all times be gladly allowed to inspect the process of manufacture.

Among the latest purchasers of Hotchkiss cars from the London and Parisian Motor Company of South Molton Street, the British concessionnaires, are the Marquess of Salisbury and Sir Philip Grey Egerton, Bart. The Hon. Francis Egerton, Major Laycock, D.S.O., and Mr. Lewis Waller have also placed orders for cars with this firm.

A 24—40 h.p. Fiat has recently been purchased by the Duke of Genoa, brother of Queen Marguerite of Italy, Commander-in-Chief of the Italian Navy, and President of the Automobile Club of Italy.

The Dunlop Tyre Company has just been favoured with a contract for the supply of motor-tyres to the War Office.

We have received a copy of the latest catalogue of Messrs. Weldhen and Bleriot, the makers of the famous Bleriot motor-lamps. Conspicuous among the many interesting novelties described and illustrated is the new auto-generator, which is a clean, safe, and easily-manipulated apparatus for producing gas from ordinary carbide. These generators may be obtained fitted in strong oak boxes ready to fix on the car, either singly or in batteries of two, three, four, or six, which can be used in turn. Each generator is sufficient to feed two lamps, and the average capacity is five hours' supply for the largest Bleriot made. Besides acetylene headlights, the firm make side and tail lamps, roof lamps for covered cars, and side and search lights for motor-boats. A new electric incandescent lamp has been placed upon the market by Messrs. Weldhen and Bleriot, which may perhaps revolutionise the existing methods of illuminating motor-vehicles. The filament is composed of a rare earth instead of ordinary carbon, and is said to consume about half the current only of the old glow lamp, while giving a powerful white light.

The Ryknield Engine Company has received an order from the Leeds City Tramways Committee for two 35 h.p. omnibus chassis. Leeds is well known as being among the most up-to-date municipalities, and the fact that the order was obtained in competition with other well-known manufacturers is an indication of the excellence of the Ryknield work.

Argyll Motors, Limited, have purchased a large tract of land, over sixty acres in extent, upon which new works will be erected. The ground is excellently situated, as it lies between the river Leven and the railway on the one side, and the main road to the Western Highlands on the other. Motor-boat trials will be possible on Loch Lomond, which is only three-quarters of a mile distant. It is hoped that the first bays of the new workshops will be completed and supplied with machinery within three months.

MAY MAGAZINES.

THE *Fortnightly Review* is, as usual, extremely topical. In addition to the ordinary outfit of political articles it contains several of general or literary interest. "Ouida" rather falls between the two stools of literature and politics. Her article "Watchman, What of the Night?" is an attempt to forecast the results of the Japanese War. Here is her opinion about East and West:

"The East has always been a toxine to the West. The white man who cohabits with the coloured woman deteriorates. Even the Hindoo, so refined, so gentle, so delicately formed, does the white man no good. What will, then, result from the union between white races and Japanese, which must inevitably follow on the crazy enthusiasm of the former for the latter? Meantime, it is certain that white influence on the yellow race is, despite the resisting power of the latter, by no means salutary, and one cannot but marvel that the latter, whilst so stubborn in rejecting many points of white influence, is yet so easily impressed in others that it can imitate the ridiculous attire, civil and military, of the European and American, and that its own easy and useful working garb, as seen in its populace, and the magnificent national costumes of its dead daimios have been, and are being, replaced by the ugliest and silliest forms of dress copied from the fashions and habits of the Western continents."

The latest of Hamlets, Mr. H. B. Irving, discourses of his own calling with the pathetic truth always before him that an actor "can but live as a memory, and memory is proverbially short." Mr. E. A. Wodehouse gives us a not very flattering "valuation" of Mr. Stephen Phillips. He thinks that the decline of Mr. Phillips's popularity is due to a calmer and maturer estimate of his powers, but we are afraid Mr. Wodehouse is not a very illuminating critic. Mr. Aflalo writes on the Sportswoman, Mr. Stephen Gwynn on the Irish University Question, and Mr. Edward Dicey on Journalism, New and Old.

The *Monthly Review* begins with an article on "Free Meals for Underfed Children" that would have been better if less political. Mr. Earl Hodgson gossips pleasantly about "The Whimsical Trout"; Walter Savage Landor is the subject of a capital article by Walter Sichel, in the course of which he takes occasion to quote the following epigrammatic sentence:

"'As pictures and statues and living beauty, too, show better by *music-light*, so is poetry irradiated, vivified, glorified, and raised into immortal life by harmony.' How fine, too, is that phrase about Milton—'The sabbath of his mind'; how happy that about Voltaire—'The papered pinks and powdered ranunculuses'; and the one about Gibbon—'Pacing up and down the unventilated school of rhetoric with a measured and heavy step.' How pregnant, also, the aphorism, 'Wrong is but falsehood put in practice!' Satirical tropes, too, are frequent, especially anent the critics—'Onion-eaters by the pyramids of poetry'; 'By the buzz of the insects we may know that the summer has come.' It is curious that none survive in the language, except one which Disraeli borrowed in substance—'Those who have failed as painters turn picture-cleaners; those who have failed as writers turn reviewers.'"

An anonymous writer contributes a well-informed paper on "Irish Education."

As usual, the *National Review* is strongly political. Holland, Russia, the Transvaal, and Australia all receiving articles; while in regard to home topics the most conspicuous article is that by Mr. D. S. MacColl on "The Royal Academy and National Art." What he advocates is a council, "Whose members would be partly nominated by the constituent societies, partly elected by the body of exhibitors in each year."

In the *Contemporary Review* Professor Lloyd Morgan leads off with a thoughtful essay on "The Interpretation of Nature." It is a vigorous effort to reconcile what we used to call science and religion, only Professor Morgan never uses the word religion. He says: "Just in so far as I am one with Nature, and therefore in physical relationships with other manifestations in terms of matter and energy, is the purpose of my being one with the purpose which underlies the manifestations of Nature, and am I in spiritual relationship with the wider and richer purpose which is thus manifested." George Brandes writes pleasantly on Hans Andersen, but the rest of the articles are mostly controversial in their character.

The *Cornhill Magazine* is quite as light and pleasant as usual. It contains articles by Sir Cyprian Bridge and Mrs. Frederic Harrison among others. From an article on Port Arthur we take the following story about Baron Nogi: "Before he sailed for Manchuria his first son climbed the frightful Nashan Hill, to get a bullet in the brain as he sabred a Russian lieutenant across the parapet. The corpse arrived in Tokyo the day the General left, and Nogi said to his wife: 'Delay funeral services until Hoten and I are brought back to lie with Shoten.' Shoten was the dead son. Hoten went with the father as a lieutenant in the first division. On December 18th a *keissheitai* (certain death party) was called for to make the last assault against the hill known as '203 Mètre.' Hoten led it. The hill fell. Hoten went to join Shoten."

Mr. Anthony Collett writes a charming article in *Macmillan's Magazine* on the "Coming of Spring." The last sentence will give a fair idea of it: "The new verdure thickens over all the land, first filling the sheltered thickets and hedge-bottoms, then the barer woods and copses, and lastly the naked fringes of the meres and streams; and in swift succession the armies of the migrant birds come pressing across the sea to tenant the new harbourage thus provided for them, and to fill the thick green places, so bare and shelterless a few weeks ago, with the songs and activities of nesting-time." Other contributors to this number are Mr. E. J. Moyna, Mr. Charles Oliver, and Miss Blissett.

In *Good Words* one of the most interesting contributions is that by Mr. A. W. Jarvis and A. Turtle called the "Greatest Library in the World." Familiar as we are with the British Museum, it is doubtful if many people knew beforehand that it originated in 1753 with the purchase of 40,000 volumes belonging to Sir Hans Sloane; and here is another astonishing bit of history: "It comes somewhat as a shock to present-day notions—especially in the light of these pious words—to learn that the Government having decided to avail themselves of the proffered advantage, proceeded to obtain the requisite funds by means of a public lottery. This was authorised by a special Act of Parliament, in which it was laid down that a

sum of £300,000 should be raised. Of the proceeds £200,000 were to be awarded as prizes, and the remainder, after defraying the cost of the lottery, was to be applied: To the purchase of the Sloane collection and of the Harleian Manuscripts; for the provision of 'one General Repository' for the reception of these two collections together with the Cottonian Library, which was already public property; and the creation of a fund of £30,000, the interest on which was to be used to meet the working expenses of the new establishment. The Act also appointed a body of Trustees."

Temple Bar frequently has articles of great literary interest, and the feature this month is a paper containing nine letters from Edward FitzGerald to Mrs. Kendal. The following is a characteristic passage: "I have spun out Waverley for more than a month; finished him only last night; the End rather too prosperous, like that of many a Drama we have known. Scott had not got out of that sort of thing. But the Eve of Preston Fight—and the Fight itself. No such *raconteur* as Goethe said of him. To-night perhaps we shall begin Antiquary—or Lammermuir—a word in which there is since him a growl of Thunder. I believe these Scotch Novels will see the Winter and Spring out with me; as each closes I think I shall never open them again." "New Ways with Old Acres" is a dissertation on modern farming. Here are some of the achievements of the federation: "The Cardigan Society sold ten tons of poultry at good prices, and sent a weekly average of fifty pigs to the London markets—pigs, be it noted, that it had first bought at good prices from their breeders in the villages round. At a village in Notts a small society with a microscopic capital bought a reaper and binder last year. The receipts from members as payment for use of this machine cleared the cost of it in the first season. At Bewdley they have erected a sheep-dipping bath or depôt, where farmers can dip their sheep at 1d. a head—a great boon, especially as sheep-dipping will be made compulsory before long. Such are some of the small beginnings of a great movement, and I should like to point out the main principles on which the societies work."

Mr. Robinson's *Flora and Sylva* is as beautiful in printing and get-up as ever, while much of the writing has a charming distinction of style, as witness this extract from a paper on "The Giant Reeds":

"When the first little rounded olive bushes begin to stud the warmer slopes, when the black cypress appears here and there in the landscape, then the great reeds begin to rise and thicken upon the river bank and beside the water-courses, till as one nears the sea they spread into wide belts of waving grey, shutting in the river between living walls as instinct with life and motion as the hurrying flood itself. They gave the name to many a little sun-bathed town village, as in Cannae, Cagnes, Cannes, Cannossa, and, in far-off days, Canna of Galilee—this 'reed shaken by the wind' thriving throughout Syria and all down the valley of the Jordan. Through many generations the great reed has played a part in the daily life of the ancient world, from the days of the early hunters and the classic warriors of old, till reed-pipes heralded the dawn of a more pastoral age, and later still the husbandman learned to adapt it to the arts of peace."

Beautifully illustrated and printed, the *Boudoir* is one of the most charming of ladies' papers. The May number contains a delightful article by Mr. Cuming Walter, who has devoted many years of study to the work of the late laureate, on Tennyson's "Gentlewomen." Mr. Laurence Irving tells us how best to commemorate Shakespeare, and the rest of the contents are up to the best standard.

ODDS AND ENDS.

THE countryman is getting quite accustomed to the sight of the little metal windmills which now dot field and farm in all directions, and denote the presence of artesian wells. Water companies are "kittle cattle" to have dealings with, and owners of agricultural land, "farmeries" on the outskirts of towns or country houses have found out the benefit of securing a constant water supply that they can depend on from within their own property. Messrs. C. Isler and Co., Bear Lane, Southwark, have taken advantage of the demand for this class of machinery, and can

"Antipon"

REGD. TRADE MARK.

The "Illustrated London News" says: "ANTIPON not only absorbs and throws out of the system all superflous adipose matter but increases strength and vitality"

"The Sketch" says: "ANTIPON may be warmly recommended to stout persons as much for health's sake as for the attainment of elegance of figure."

PERMANENTLY CURES OBESITY.

Beware of Getting too Fat.

THERE is a danger in over-stoutness which is too often ignored. The muscles of the heart become so impregnated with fatty deposits that the action is sensibly weakened. Fatty degeneration of the heart leads to fatal results: syncope may occur after a little over-exertion at any moment. The liver and the kidneys are also dangerously affected by excessive fatness, and their consequent sluggish action produces all kinds of evil results: the impure blood is teeming with diseased fatty particles and waste matter; the circulation is weakened; the skin fails in its eliminative work; breathing becomes difficult; profuse sweating, vertigo, faintness, exhaustion after small effort—all these symptoms cry "Danger!" and the cry is unfortunately too often unheeded.

Thanks to the discovery of "Antipon," which is now recognised as the standard remedy for the permanent cure of obesity, these evils can be quickly and radically dispelled. "Antipon" is positively the most potent fat-absorbent ever known. It eliminates all the diseased and superabundant fatty matter, both the dangerous internal deposits and the superfluous surface-fat. At the same time it lastingly destroys the fatal tendency to fatty degeneration.

"Antipon" acts rapidly and reliably. Within a day and a night of the first dose there is a diminution of weight varying between 8oz. and 3lb., according to the particular case. Then a daily reduction, sure, steady, and satisfactory, is set up, and continues unabated until the recovery of symmetrical proportions and correct weight for height, according to accepted standards. The "Antipon" treatment may then be discontinued, the reduction being permanent.

The splendid tonic action of "Antipon" on the digestive system is positively revitalising. The appetite becomes keen, and the normal nourishment taken goes to increase strength and vitality—muscular development instead of fat development, rich blood instead of weak and impure blood. Thus, after a course of "Antipon," the once over-stout person becomes perfectly strong and healthy, bright and energetic, alert, graceful, and able to enjoy to the full the rational pleasures of life. No dietary limitations are exacted; at the table no special dietary need call attention to the fact that any treatment is being followed. "Antipon" causes no stomachic or other disturbance. It is perfectly harmless—a simple tonic liquid of purely herbal ingredients—that is all. At the offices of the "Antipon" Company many hundreds of grateful letters, carefully preserved for reference, testify to the marvellous permanent effects of this wonderful fat-destroyer and health-restorer.

"Antipon" may be had of any Chemists, Stores, etc., price 2/6 and 4/6 per bottle; or should any difficulty arise, may be obtained (on sending cash remittance), post free, under private package, direct from the Sole Manufacturers—

point to "plant" laid down in almost every county, which is giving satisfaction to the purchasers, one at Hever Castle notably, which, sunk to a depth of 300ft., yields 8,000gal. per hour. The initial expense of installation is compensated for in the long run, as always, by the durability, of the good workmanship skilfully applied, and the long list of customers supplied by this firm should be a great recommendation to all intending purchasers.

—o—

In connection with the approaching visit of the King of Spain to this country a good many officials are said to be studying the Spanish language. It may interest these gentlemen to know that His Majesty Alphonso XIII. is reported to have already acquired a good and working knowledge of German and French under the guidance of the teachers of the Berlitz School of Languages in Madrid, as is shown by the fact that he was lately able to receive a Royal visitor and converse with him in the latter language. The method of this school, in whatever country it happens to be situated, is described as "a common-sense system, which overcomes the difficulties of grammar and renders the study of languages a real pleasure," and if it can indeed live up to this definition, its practical value cannot be over-estimated in these days in preparing for a career, either diplomatic, social, or commercial, or even, as is shown by the present case, that of a reigning monarch himself.

A SCOTCH TRAIN "DE LUXE."

—o—

The Great Eastern Railway are doing their utmost to remove the reproach of insularity so often alleged against us by foreign nations. In connection with the exhibition held this year at Liège, they announce an accelerated service *viâ* Harwich and Antwerp, and from May 1st issue cheap returns, which include a short visit to Brussels.

As the English visitor to the North looks about him in any Scotch hotel he cannot but be struck by the fact that quite a large proportion of his companions are Scotsmen. Like wise men, their first idea when taking a holiday is to explore their own country before wandering elsewhere, and additional proof is given of this tendency by the recent institution by the Caledonian Railway of a corridor express between Edinburgh, Glasgow, and Aberdeen, on a scale of comfort, not to say luxury, hitherto locally unknown. A feature of the train is the length of the carriages, 65ft. from end to end, and a novel, and we think a most valuable, adjunct is the presence in the guard's van of a safe locker for consignments of special value. No doubt the linking up in this way the three great Scottish centres will be of inestimable value also to business men throughout the year, whose affairs necessitate frequent visits to one or other of the towns, and who will appreciate even more than the holiday maker the ability to make them rapidly and in comfort.

—o—

Burton Holmes, whose travelogues, or finely-illustrated "travel talks," made such a fine impression at Queen's Hall, London, last spring, will soon be heard at Bechstein Hall, Wigmore Street, W., in a new series. His season there will cover three weeks, he giving four matinées and two evening travelogues each week. He is at present appearing at some of the principal theatres and halls in New York, Boston, Philadelphia, and Washington, where he is actually turning patrons away from nearly every performance, and is obliged to give extras to accommodate his would-be fellow-travellers. Even in the Auditorium, Chicago, the largest theatre in America, he talked to crowded houses, and was obliged to give two extra items. His London season begins at Bechstein Hall on Monday, May 8th, his travelogues being new to English audiences, with the exception of the Yosemite Valley, which is to be repeated in response to numerous requests.

—o—

A concert, by the kind permission of the Duke and Duchess of Sutherland, will be given at Stafford House on May 17th in aid of the Cottage and Orphans' Home Fund of the Furniture Trades' Provident and Benevolent Association. It will take place under Royal patronage, and Mme. Albani has consented to sing. The opportunity of seeing the interior of this beautiful house will doubtless be an added attraction for many. The object of the association is to train and educate the orphan children of those who have been employed in the furniture trade, at cottage homes built for them at Radlett in Hertfordshire. The concert will be preceded by a reception and followed by a soirée.

CHOOSE 'HYDEA'
(Regd.)
It is a cloth—made from the best English wool, grown on the HYDE and other English Farms—strong—handsome in appearance—elastic—exquisitely soft. For outdoor purposes—suitings—breeches—etc., etc., you can get no cloth that will please you like "HYDEA." **His Majesty the King wears it. H.R.H. The Princess of Wales has ordered it.** But it is not expensive by any means. **Can be obtained of all Tailors.** Send for Booklet:—APPERLY, CURTIS & Co., Ltd., Dudbridge Mills, Stroud, West of England.

THE season promises to take as its chief text the old Scottish song, "For she shall walk in silk attire, and siller hae to spare"; though it is, perhaps, open to doubt whether she who does the first will also fulfil the second part of the prophetic strain. I do not think many women will have "siller to spare" if they are at all sensible to the charms of the fashions of this year; for never have colours and materials and designs been more tempting and picturesque than they are this season. The gamut of silks alone is an irresistible temptation to multiply one's frocks in a way that will certainly leave no "siller to spare" in most feminine pockets. For it is silks all along the line, for both day and evening wear; silks so soft that they could be drawn through a ring; silks of colours so delicate that they put the inside of a shell to shame; silks united with tiny brocaded flowers or imperceptible lines that add a sheen to the surface—a bewilderment of silks which are a caress to both eye and hand, and are, above all, the most complete expression of the Eternal Feminine.

As I have chosen silks for my text this week, it is well that I should illustrate the subject worthily; and every woman who looks at the accompanying sketches will acknowledge that they leave nothing to be desired as regards proving the attraction of silk. The first one is a dress designed for the Cup Day at Ascot; for, though we seem to have only just begun the season, yet time flies by so quickly during May and June that it is well to decide on the armour for one's campaign beforehand, especially as by doing so one obtains an amount of attention at the hands of the dressmakers which is not to be had when they are working overtime, and heads of establishments are devoutly praying that the inspectors will not "happen in" to their workrooms too often. How to conciliate the frantic demands for dresses in the season with the working of the Factory Acts is one of the annual problems which make the male dress-maker prematurely and frankly bald, and drive his feminine counterpart to wear "transformations" which often get shoved away in desperate moments. Therefore, as a matter of loving-kindness to one's neighbour and of benefit to one's self, it is well to order one's clothes in good time. Hence the Ascot frock on this page. It is in a rosy orchid mauve taffetas chiffon, shot with silvery white. The skirt is very slightly gathered at the hips, and strikes a new note in being innocent of gaugings or flounces. Its trimming consists of large diamonds of the ubiquitous Valenciennes lace, outlined by pale pink chiffon roses, the diamonds being combined by festoons and loose bows of orchid mauve ribbon velvet. The bodice is made of white Valenciennes lace over pale pink taffetas, held to the figure by a deep-pointed corselet made of the ribbon velvet, finished by a series of graduated bows down the front, the largest bows being at the top of the corselet. Across the bust is a line of the pink chiffon roses, held by straps of the velvet which pass over the shoulders, and are finished with bows at the back, and a little bow of the velvet finishes daintily the transparent collar-band of lace. The sleeves of taffetas are very fully puffed at the shoulder, the fulness being caught tightly to the arm in a series of folds on a level with the bust, held in place by chiffon roses, the sleeves being finished at the elbow by frills and bouillonnés of Valenciennes lace with a double band of velvet. The hat is of white crin, caught into a tricorne shape by a cluster of small roses at one side, and a large single rose at the other. The sunshade is of mauve taffetas, with a printed border of roses in chiné tones, and lined with frills of pale pink chiffon. Given the blessing of a sunshiny Cup Day, will any dress look daintier than this one in the enclosure?

A DAINTY DRESS FOR ASCOT.

The second illustration deals with the allurements of taffetas for evening wear. It, too, shows the prevailing affection for the Louis XV. form of decoration in its garlands of roses combined with velvet ribbons. It is more emphatically Pompadour still, for it gives the mixture of pale blue and pink which was the special affection of the artistic soul of the famous marquise. The pale blue silk skirt is pleated at the waist, giving a pleasant roundness to a slight figure, and it is trimmed with oval garlands of pink Banksia roses, or *roses pompon* as they are known in France, joined by crossed ribbons of blue velvet of a slightly (but very slightly) deeper shade than the silk itself. The bodice is deeply pointed, the silk being draped across the figure diagonally, showing a chemisette of white chiffon at the left side, the silk being outlined by a garland of roses. Above the chiffon is a band of velvet finishing in a loose double bow and ends at one side, while an upstanding tucker of chiffon encloses the shoulders.

FOR EVENING WEAR.

The sleeves are very quaint and original, the upper part being a full puff of the taffetas, below which is a full sleeve of chiffon divided into two small puffs with bands and bows of velvet, and finishing in a frill of Valenciennes at the elbow.

An artist who can design such charming costumes as those with which Mr. Percy Anderson has enriched "Véronique" and "The Little Michus" must also have some original ideas on modern clothes; and artistic originality being always an attraction to me, I went to see some of the newest creations at Mr. Nettleship's in Wigmore Street this week. There I fell in love with what may be called an "unpublished work" of Mr. Anderson's, the most dainty *débutante's* dress I have ever seen, which, though not finished, filled me with admiration. The skirt was of white tulle, embroidered with a lovely running design of forget-me-nots and microscopic roses, the embroidery being entirely done in ribbons. The flowers looked as if they had been blown on the tulle; and how such work could be done on so diaphanous a material, I do not know. The bodice was a little Louis XV. coatee with small square basques, and was made of turquoise blue taffetas with an almost invisible line of paler blue in it that broke the surface and gave an extraordinary sheen. It opened over a full vest of white tulle, and over all ran the embroidery of forget-me-nots and roses, the tulle and silk of the dainty sleeves being caught with hanging bunches of the little ribbon flowers. The whole dress was like a breath of spring, the freshest, daintiest thing I have ever seen for a young girl. Of quite a different character was a cloak of Mr. Anderson's designing. It was an evening cloak to cover the whole dress, and the material was black velvet cut out on a lining of copper chiffon. The beauty and continuousness, as well as gradation, of the design from hem to shoulder, were specially remarkable, for it was quite unlike the ordinary appliqué designs of commerce; and well it might be, for the cloak was first made entirely in velvet and the design then traced on it from Mr. Anderson's drawing, and the material cut away. It really gives one rather a pang to hear of so much beautiful velvet being wasted; but the effect of this lovely design, shown up by the copper chiffon underneath, was extraordinarily fine and altogether uncommon. Many were the beautiful Paris models I saw in Wigmore Street, especially a dress for that neglected section of society, the elderly lady who wishes to dress well, but has the wisdom (rare nowadays) to object to being asked to wear clothes fit for her granddaughter. This dress was mouse-coloured silk muslin, the skirt very much trimmed with gaugings and flounces, interspersed with medallions of black and white lace. The bodice was a coat of beautiful black lace over mouse-coloured chiffon, fitting at the back, with full picturesque basques of a sedate and dignified length, but loose in front, where there was a charming confusion of chiffon and lace, with a bow of soft rose satin at the throat to enliven an elderly complexion. It was a most charming dress, rich, dignified, and picturesque withal, as it should be, for there is no reason why a woman should not dress well and take an interest in her appearance, even if she should have passed the milestone of sixty and is not ashamed of the fact.

The immense saving of time and trouble which can be gained by studying such a catalogue as that just published by Messrs. Peter Robinson of Oxford Street is almost beyond description. In this charmingly-illustrated book, "Fashions of To-day" (which will be sent gratis and post free on application), one can practically wander mentally through the whole of Messrs. Peter Robinson's immense establishment and make one's choice of dresses, cloaks, millinery, under-linen, hosiery, and all the thousand and one things modern dress requires, while resting comfortably on one's sofa. Then, when one knows exactly what one wants, and in which department the various objects of one's affections are to be found, one can either write for them or go straight to inspect them in person. The book bears the appropriate quotation from Tennyson:

> "Let never maiden think, however fair,
> She is not fairer, in new clothes arrayed,"

and certainly the latter-day maidens and matrons are lucky in being thus encouraged by both poet and purveyor to set off their charms to the best advantage. The illustrations of the dress department alone are worth sending for the book to see, for they give a most admirable idea of the immense variety of design which characterises this section of the great establishment in Oxford Street. I particularly admired the "Victorian" dinner-dress in soft satin, at the remarkably low price of 8½ guineas, lined throughout with silk; and another charming evening model is the "Irene" in crêpe de chine, which is still less expensive, being only 8 guineas. One of the specialities of the moment is the delightful little morning frocks with sun-ray or pleated skirts and neat bolero bodices, the complete costume in serge or fancy tweeds, or in the new fancy check materials, being only 52s. 6d. Nothing neater for morning summer wear, either in town or country, could be imagined than these dainty little dresses, which can be had in all colours. The variety of blouses is extraordinary, and in connection with these may be mentioned the large selection of fancy belts, for nothing finishes off a blouse so well and effectively as a pretty belt. Space fails me to describe in detail all the wonderful opportunities set out in Messrs. Peter Robinson's "Fashions of To-day," but a desire expressed on a post-card will bring the book itself, and my readers can then judge for themselves of its attractions.

Those who have not yet taken advantage of Messrs. J. W. Benson's sale of the fine stock of a West End jeweller (which they recently purchased), will be glad to hear that the firm have decided to continue this most advantageous sale for a few weeks longer. Rings, pendants, bracelets, head ornaments, etc., of the finest quality and the newest patterns are offered at two-thirds of the original marked prices. This sale, combined with Messrs. Benson's plan of selling on *The Times'* system—the whole payment not being required at once, but spread over a lengthened period—offers a most unusual opportunity for obtaining fine jewellery at most moderate prices.

When writing a week or two ago about the great merits of the Cravenette waterproofs, I find I made a small error in saying that the Cravenette Company had adopted the name "Eminent" for their materials. This name is the sign-manual of a well-known firm who make up the Cravenette materials into the desirable waterproofs I wrote about, the Cravenette Company dealing with the stuff in the piece. The "Eminent" garments can be obtained from all the leading retailers. LAMIA.

A DAY'S DUCK-SHOOTING IN KASHMIR.

HAVING heard glowing descriptions of the duck-shooting to be obtained in Kashmir, I left England in the autumn of 1904 with my friend C., and sailed to Bombay. From there we took train to Rawal Pindi, whence our journey to Srinagar, the principal town of Kashmir, was done in "tongas." A tonga is by no means an uncomfortable vehicle, provided you sit in the back seat, where you escape the greater part of the dust, and also the splinters of steel which flake off the pole, and cause great irritation if they get into your eyes. There are no springs to the conveyance, which is set on two rough wheels, the whole turn-out looking rather like a small farm-cart tented over with a canopy of rough canvas, and drawn by two ponies, who usually go at a gallop. The distance from Rawal Pindi to Srinagar is nearly 200 miles, and the ponies are changed about every five miles. The journey can be done by "mail-tonga" without break; but for rest, and for the sake of the two ladies who were with us, we stopped at "dak bungalows," or rest-houses (equivalent to our British inns) for two nights *en route*. The scenery was very grand and magnificent, and for the greater part the road follows the course of the river Jhelum. At times we passed through forests of splendid firs, and at others we caught glimpses of lofty mountains capped with snow. The road is really a fine piece of engineering, being hewn out of the sides of the steep mountains, and in many places only a loose wall of stones, some 2ft. high, separates one from a precipice hundreds of feet in depth. It was surprising to suddenly turn a corner and come face to face with such a modern invention as a steam-roller, which seemed most incongruous with so wild and beautiful a *mise en scène*. After three days' driving we reached Srinagar, an Oriental town some 6,000ft. above sea-level, with a somewhat Chinese appearance, the houses being for the most part two or three storied, and with thatched roofs. There is a large floating population, who live in houseboats, or "doonghas," in which they carry on the business of bringing hay and fodder from the more eastern parts of Kashmir. The white population numbers under fifty, but is greatly increased in the spring and summer by visitors, who come up to escape the Indian hot weather, and who live in luxurious and well-appointed houseboats which transform the river Jhelum into an Oriental Thames. The date of our arrival in Srinagar was December 5th, and we drove straight to the houseboats we had taken for the month. Here we found every luxury—fires in the bedrooms, excellent drawing-room and dining-room, and cookboat in attendance for our servants. Having comfortably settled down, we called next day on our friends at the Residency, and also on the Maharajah,

ON THE EDGE OF THE "JHEEL."

and were delighted to hear that a duck-shoot on a "jheel" preserved by the Maharajah had been arranged for December 7th. Our cartridges and guns were well looked over, and on the morning of the 7th we met at the Residency at 9.30, where we were introduced to the seven other guns, who, with C. and myself, made up the party of nine. From there we drove down to the "jheel" known as Hokra, about seven miles out of the town.

This "jheel" is an ideal resort for wildfowl of all kinds. It is surrounded with rushes and reeds some 6ft. high, while in the centre is a large expanse of water for the most part shallow and full of aquatic vegetation. Having drawn for places, it happened that C. and I drew 1 and 2, and we proceeded to embark in boats to be rowed to our respective positions. These boats resembled what we know as canoes, but which are about 15ft. long by 4ft. broad, being manned by two natives, one armed with a pole, the other with the heart-shaped paddle peculiar to the district. We each took 500 cartridges in our boats, also a liberal luncheon and "solar topees" for the sun in the heat of the day, as well as heavy overcoats to put on directly the sun went down. Piano stools with screw tops were also thoughtfully provided, so that we might the easier swing round when duck were coming, as we had to shoot sitting, since the reeds were not otherwise high enough to screen us. The ladies, having expressed keen desire to see the sport, accompanied us, one going with C., the other with myself; and both made themselves extremely useful by handing second guns and otherwise assisting us. Each boat was followed by one or two others as "pick-up" boats, the duties of these being to keep near, and go after any ducks that they saw fall. We shoved off about 10.15, and for the first quarter of an hour pushed our way through the tall reeds, disturbing as we went several Kingfishers, who dashed off glittering like jewels in the morning sun. Only an occasional flock of Wild duck rose near us, and it was not till we emerged on the open water that we saw what masses of duck were there. The water in front of us was black with them, there were thousands, tens of thousands, even hundreds of thousands. When a whole batch of them rose they looked like flies on a window-pane in winter, and the noise of their wings was like the roar of a waterfall. It was almost incredible. As far as the eye could see were masses upon masses of wildfowl, making black patches where they sat on the water, and obscuring the view when they circled round and round. They were mostly Wild ducks (Anas boscas), though there were a goodly number of Teal (Querquedula crecca). The noise of the wings deadened every other sound, and it was only very occasionally that the quack of a Mallard, or the shrill piping note of a drake Teal, could be distinguished in the general hubbub. Strict orders had

CIVILISATION IN THE WILDS.

CARRON COMPANY

Incorporated by Royal Charter 1773.

CARRON, Stirlingshire, N.B.

Manufacturers of Artistic

FIRE-PLACES

to harmonize with every style of Furniture and Room Decoration.

Too much care cannot be bestowed upon the selection of a suitable fire-place suite as it is truly the key-note of all room decoration. Carron Company are actual manufacturers of fire-grates, plain and ornate, of every size and style; many of the Company's designs have been created by eminent artists and are acknowledged to be among the finest extant. The artistic appearance of all Carron Fire-Grates has not been permitted to interfere with their efficiency.

The Suite illustrated is of the XVIIIth Century Design. The ornamental decoration on the Interior Grate and Panels is in the "Adams" style. The originals were carved in wood at Carron by Haworth over a Century ago, but the whole has been re-constructed on modern principles to give off the maximum amount of heat, and effect complete combustion of fuel. The grate is finished Armour bright, and the mantelpiece is of inlaid mahogany with marble slips. The hearth is composed of suitable tiles, while the curb and irons are in perfect keeping.

Carron Company manufacture Iron Goods of every conceivable kind. Cooking Ranges, Heating Stoves, Baths, Stable Fittings, etc., etc. Everything of the finest possible quality and representing the highest skill of an industrial undertaking with an unbroken business experience of over 146 years.

Carron specialities are obtainable from all Hardware Merchants, etc.

Instruct your Furnisher to supply or Architect to specify Carron Productions.

CARRON COMPANY'S FIRE PLACES, COOKING RANGES, etc., are on view at their various showrooms—

15, Upper Thames Street, London, E.C.; 23, Princes Street, Cavendish Square, London, W.

Agencies and Showrooms at Liverpool, Manchester, Bristol, Newcastle-on-Tyne, Glasgow, Birmingham, Dublin and Southampton.

been given to us all not to fire till we got to our places, and not then till we heard a signal shot; but most of the wildfowl were sufficiently wary to rise out of shot of our boats even had we been allowed to shoot. At 10.45 we got to our position, which consisted of a rather larger canoe-shaped boat moored in a clump of rushes with open water in front of it, and for about 80yds. behind it, where a fringe of tall reeds commenced and stretched right back as far as could be seen. The guns, cartridges, luncheon, etc., were quickly transferred, and the piano stool was clamped down fast into our new boat; the two pick-up boats were then sent to either side, about 200yds. apart, and we had time to arrange the reeds and rushes so as to make a better screen. The view from our position was magnificent; in front stretched the open water for about half a mile, then came a tall fringe of reeds; behind these could be seen the avenue of silver poplars on either side of the main road to Srinagar, and beyond the trees towered the purple Himalayas with their snow-clad summits. In fact on every side the horizon was formed of snowy peaks, and the sun being bright and the air keen and frosty, the reflection in the still water was particularly clear, and the whole scene one of more than ordinary beauty. Natives or coolies in canoes were now rowing about in the open water, and the neighbouring "jheels," to keep the wildfowl on the move, while others on foot disturbed the marshes behind us; but it was not till 11.20 that the signal shot was fired. Instantly the firing all around began. Ducks came from all directions, at all heights and angles, and for the first fifteen minutes it was a case of load and fire as fast as we could. The guns were about half a mile apart, and C., at No. 1 stand, was the most favoured. He made the most of his opportunity, for in the first hour he knocked over sixty-one ducks. After the first half-hour the ducks got far more wary; they seemed to have found out where the guns were posted, and came circling over at a great height, shearing off from our boat just as we thought they were going to come nicely to us. The masses of wildfowl having now split up into smaller lots or pairs, the different species were more readily distinguishable. Quite 60 per cent. were Wild duck, 20 per cent. Teal, 10 per cent. Gadwall (Anas strepera), while the remainder were made up of Shoveller (Spatula clypeata), Red-crested Pochard (Fuligula rufila), Pochard (Fuligula ferina), Wigeon (Mareca penelope), and White-eyed Pochard of both the Eastern and Western types (Nyroca baeri and Nyroca nyroca). A flock of twenty-four Grey lag Geese (Anser cinereus) passed high overhead out of shot, and speedily left the locality, though they came back again late in the afternoon to see what was going on, when one was knocked down, but not eventually brought to bag. The Pintail (Dafila acuta) is, we were told, seen here later in the season, and amongst other varieties of ducks that have been got on this "jheel" are Ruddy Sheldrake (Tadorna casarca), Garganey (Querquedula circia), Stiff-tailed Duck (Erismatura leucocephala), Smew (Mergus albellus), Goosander (Mergus merganser), Marbled Teal (Querquedula angustirostris), Golden-eyed Duck (Clangula glaucion), and Tufted Duck (Fuligula cristata), some of which are of very rare occurrence; in fact, several have only been got here once or twice, but specimens of most of them can be seen stuffed in the Museum at Srinagar. The majority of these ducks are not bred in Kashmir, but are visitors from the Tibetan breeding grounds. But to return to our day's sport. At 1.30, as prearranged, there was a half-hour's interval for lunch, and also to allow the wildfowl a chance of recovering from their morning's scare. It was very exasperating and tempting to see ducks flying within easy shot without being allowed to fire, and I fancy some of us yielded to the temptation. Perhaps we each thought the luncheon interval was to have been at a different hour; but, whatever the cause, shooting was practically incessant at some part or other of the lake. During the respite, a pick-up was made of the ducks that had fallen. I had kept as careful a count as possible of what I had knocked down, and out of eighty-one I claimed, my human retrievers brought sixty-seven to hand. Of course, a duck which is winged and which falls far back has a good chance of escape, and the recuperative powers of a wounded duck when in the water are well known; but the following day I heard a far more suggestive reason for the shortage, namely, that the natives can get four annas apiece for each Wild duck, and three annas for each Teal that they bring to the Srinagar market. The Kites, which were continually circling near on the chance of picking up a wounded duck, are very rarely successful; and an occasional long shot at one kept them at a respectful distance. After the pause for lunch the ducks seemed even more 'cute than ever. They came very high and seldom straight over our hiding-place. Often and often the No. 5 shot rattling all over their bodies told us that they were out of shot, but the clearness of the air was deceptive, and we kept on firing many impossible shots; for after all, as the old Scotch keeper who taught us to shoot used to say, "They're in more danger than yersel." But as is always the case with high shots, when one came off it was worth ten of the lower flying order, and certainly there were some fizzers. Shooting off the very top of the shoulder, absolutely straight overhead, we killed two or three ducks, which fell dead fifty yards behind, making such a splash in the water as to throw up a veritable geyser. A wisp of Teal would occasionally dash past, and one lot nearly knocked my cap off, coming as they did from behind me, having escaped the vigilance of my fair marker, who, it should be recorded, had several times during the day drawn my attention to birds I should never have seen had it not been for her keen look-out. About four o'clock the ducks from all sides appeared to make a decided flight to the "jheel," and thousands could be seen, mostly in little skeins or parties, hundreds of yards up in the air, circling round and round, and ever dropping towards the centre of the water. As they got nearer, the rush of the air through their wings and tails made a wonderful sound that will never be forgotten. But the firing all round, and the boats moving in the open water, would not allow them the peace they required, and by degrees the incoming flocks grew less numerous as the ducks went off to distant and more secluded lakes. And now the sun was setting, tinting the snow-clad mountains an ever-intensifying shade of rose, which, with the foreground, afforded by the avenue of silver poplars, was reflected as in a mirror, in the still waters of the "jheel." At every moment the scene was bathed in fresh colours of indescribable beauty till, as the sun went down behind the Himalayas, the darkness as quickly came on, and with it the chill air so peculiar to this Eastern climate. Fur coats were hastily put on, and the pick-up boats called to make their final round. The Coots, which hitherto had not put in much of an appearance, could now be seen half flying, half shuffling, across the water to their quarters for the night. Only a very occasional duck could be seen, and these could not be expected to come near with the noise and flurry of the pick-up going on. The ducks were sorted out before leaving our moorings, and I found my natives had found 52 Mallard, 33 Teal, 8 Gadwall, 2 Red-crested Pochard, and 1 Eastern white-eyed Pochard; in all, 96. I had reckoned that I had 117 down; but it was too dark for further search; as it was we did not get off with all our impedimenta till nearly six o'clock. Getting back to the morning's starting-place we found the other eight guns. The highest individual total had been got by C., which equalled my own; but he had had fearful bad luck. About four o'clock, as the duck seemed to have entirely ceased to come in his direction, he made signs to his boatmen to move somewhere where he could have better shooting, but his natives either misunderstanding

him, or through laziness (probably the latter), promptly took him home. He, too, had failed to get all he shot, as he was confident of having killed 113. The ducks which had come to his position in masses in the earlier part of the day gradually grew scarcer and scarcer, which was very different to my place, to which the ducks came on and off all the time, though never in such great flocks. The total bag to the nine guns was 526 wild-fowl, but owing to each gun taking those he wanted home with him, it was impossible to find out exactly how many of each species had been obtained; however, the bag included Wild duck, Teal, Gadwall, Shoveller, Red-crested Pochard, Pochard, Eastern and Western white-eyed Pochard and Wigeon. A whisky "peg," on the banks of the "jheel" was most acceptable before our drive back to our houseboat, where, after a bath and dinner, we enjoyed (as is usual on such occasions) a great "bukh" over the performances of the day. I can fancy that the reader may wonder what was done with so many ducks in such an out-of-the-way spot. Those that were not taken by the individual guns were heartily welcomed by the inmates of the State Hospital at Srinagar. Our shoulders were pretty sore, and we were both very stiff, for all our shooting had been done in a sitting posture, so we were not slow in getting to bed, where we ended a most satisfactory day in the soundest of sleep.

CLAY-BIRD-SHOOTING . . . . AT COUNTRY HOUSES.

WHEN the last day of covert-shooting is long past, and even the wild-fowler has been compelled to lay aside his punt-gun, then really begins the season of the clay-bird-shooter, whose love of the gun and its use is not in any way controlled by the laws of game preservation. About the middle of March the little bird of clay becomes the leading feature not only at the shooting schools, which then become busy, and the gun clubs, which then open, but also at the numerous country houses, where sets of traps and birds are to be found available for amusement and practice in the surrounding policies during the close game season. There is much to be said in favour of the shooting of clays, not only as an amusement available to every gunner during the close season, but also as a means of preparing young shooters for the greater delights of the actual pursuit of game. The sport as followed for instance at a country house requires little outlay, no great sacrifice of time, scarcely any previous preparation, and is always possible to the gunner be the weather wet or dry.

The original clay-bird and trap, as we all know, was invented by an American, and, like many useful and profitable inventions, was discovered mainly by accident. We need not retell the story of how that American was led to his discovery by picking up some clam shells and getting a small boy to throw them in the air to give the shooter some practice at flying objects. But the truth of the story is evidenced by the construction of the trap and clay even at the present time; the trap is made on the principle of the small boy's arm, having a strong coil wire spring for the muscle power, an arm of steel swinging on a pivot at the elbow, and a carrier which holds a clay as the boy's fingers did the clam, the saucer-shaped disk of clay being moulded and baked into the shape of a clam shell, so as to skim through the air as nearly as possible in the manner of a flying bird.

The club system of shooting clays has not been the success in this country that it has been in America, but, on the other hand, on this side the popularity of the bird of clay for private practice with the gun, and in obtaining instruction in its use, has increased in recent years by leaps and bounds. The drawback to clay-shooting at clubs, in the eyes of game shots, is that success can only be achieved in it by possession of a gun fully choked in both barrels, a cylinder game-gun, however great the skill of its owner, having no chance at all at the clubs in competition with full-choked barrels. The reason is that almost all the clays used in competitions at the clubs are thrown away from the shooter; and the objects being small, and the distances long, particularly for the second barrel, the clay, in the absence of a sufficiently close pattern, may fly end first through the pellets unsmashed. With the closer-patterned chokes these clays would have been unfailingly broken up. Competitors accordingly realise that to succeed in such club competitions they must purchase either new guns or new pairs of barrels, which would be useless to them, from the large amount of choke they possess, for any other purpose. And they further realise that even if willing to go to the expense of special guns, they would purchase them to enable them to smash birds flying away from them, the very opposite to the conditions which obtain in game-shooting, where driving reigns supreme. Both these disadvantages in the club system of clay-shooting are absent from private practice with clays at a country house, or even in the grounds of a shooting school. There the clays can be, and are, sent over the shooters in the manner of driven birds, and the very best gun that can be used for such shooting is the ordinary plain cylinder game gun. Further, in private grounds, the beginner in shooting can generally find some one able to give him hints and advice, which will aid him in avoiding errors. The same kind of shot can be offered again and again at clays thrown in a certain fixed direction over his head until he succeeds at last in smashing them every time. He finds out peculiarities in alignment and aim that have to be guarded against and overcome, and realises the reasons why such peculiarities are detrimental to good shooting. He gradually becomes a more expert shot than he has been before, and acquires in progress of time that confidence in taking difficult shots that is so necessary, if he is to be seen at his best at a shooting party.

As a basis of practice, as well as of instruction in shooting, the popular clay is unsurpassed; there is no other artificial aid to acquiring skill in shooting that approaches it. It is, indeed, more than doubtful whether as an educator in shooting, it is not superior to the actual shooting of game itself. Nor does clay shooting prove beneficial only to beginners or novices at a private ground; the aid it affords for practice of the most difficult shots appeals with equal strength to the finest, as well as the worst of game shots, for even the crack shot has his weak points in regard to some variety of difficult shots, which he finds himself occasionally missing in his covert shooting, but which he can reproduce and take by the aid of the driven clay as often as he chooses until perfectly certain of bringing them off without fail every time.

An objection sometimes raised against the shooting of clays for practice is that, while winged game rise slowly and increase their speed of flight as they progress, the clay starts its flight at a very high rate of speed, and slows down gradually until it falls. It is argued that shooting at such a flying object tends to spoil the form of a good game-shot. It is quite true that the clay does so slow down after it has gone some distance in the air, but in practice this peculiarity, absent from the flight of live game-birds, is not permitted to affect the calculations of the shooter or to change his style. If properly erected, the traps are concealed from the gunner behind a wooden or other erection—a natural or artificial screen—from which the driven clay emerges in imitation of partridge or pheasant, according to the height of the screen. It has travelled, however, the first 10ft. or more of its flight—its fastest portion—before the gunner can fix his eyes on it at all. It is seen only when sailing over or across the shooter at a steady speed, similar to that of driven partridge or pheasant, as the case may be, and only during that time of travel is he expected to shoot at it. The speed of a partridge or pheasant in flight does not increase after it is well on the wing, and for about 40ft. or 50ft. of travel the speed of the clay varies very little, if well driven, averaging as nearly as may be the rate of driven game-birds, though, of course, its rate of flight can be increased or diminished by skilful manipulation of the screws of the trap. The strong point of the clay in sport, both for entertaining and amusing practice at driven birds and for improvement in shooting skill, is its great adaptability, by easily-understood mechanical means, to all descriptions of shooting to be had in this country in which a shooter is desirous of perfecting himself.

Nor is it necessary in these days in the country to go to the trouble and expense of laying out a shooting-ground with a set of traps for the throwing of clays to obtain excellent practice wherever there may be a small area of cleared ground, bounded by a hedge or bank sufficient to conceal the thrower of the clays using a hand-flinger. This is a very useful invention on the principle of the hand of the clay trap, but without any springs or other mechanism, the arm of the thrower doing the work required. By its use clays can be fixed in it and thrown as if from a sling over the shooter in any direction and from any angle he desires. The working of this instrument has now been brought well nigh to perfection, avoiding the breaking of its birds in fixing them in its hand, and throwing them with all the speed of flight and accuracy of those thrown from a trap, that costs four times the price, and requires more trouble to fix securely in the ground so that it gives satisfaction in working. For competition, even in the country, a trap or two may be preferable to a hand-flinger, but for practice or instruction in shooting the latter is quite as serviceable as the former, and owing to its handiness and inexpensiveness, is yearly coming more and more into use for the throwing of clays over the gun in private practice in any open field in the neighbourhood. To begin with, birds may be thrown away from the shooter. The gunner stands a yard or so in front of the thrower, who is about three yards to his left. The bird is thrown up at an angle of 30deg. or so, and it can be easily broken by the shooter, having been thrown about 4ft. above the ground straight and fast. Others may be thrown to the left varying the height and the angle. Then crossing shots may be tried, the thrower standing about 20yds. in front of the gun and about the same distance on either side, throwing directly crossing or slightly quartering birds, which may be greatly varied both in height and angle. Having in this way accustomed the gun somewhat to the flight of the clay discharged by the hand-flinger, the thrower may get behind a hedge or fence and fling his birds over the head of the shooter in the open, sending them over the hedge as a driven partridge would come over a stand at a drive. A great amount of pleasure can be derived from the hand-flinging of clays in this manner, and excellent practice for the shooting of driven game can be enjoyed. The position of the thrower and the angle of flight can be changed with every bird, or the same direction can be adhered to for fifty birds in succession. The two hand-flingers most used are those of Messrs. Westley Richards and Co. and Messrs. Cogswell and Harrison, but we prefer the former as the lightest, weighing only 6oz. against the 13oz. of that made by the latter firm. But with either flinger and a barrel of birds no gunner need find time hang heavily on his hands at any house surrounded by a sufficient extent of open grounds to permit practice with the gun. He may rest assured that either with the aid of trap or hand-flinger the ubiquitous little clay bird can provide him with the means of keeping his hand in as a marksman, and even of improving in some measure his form as a game shot, with very little trouble or expense and a good deal of healthy pleasure to him if he really is a keen devotee to the gun.

INCREASE OF NESTING WOODCOCK.

FROM all the accounts of keepers and others who have an opportunity of judging, it seems certain that the change in habit of the woodcock in its nesting has been developed this year at even a greater rate of progress than usual. In the middle of the last century, it is evident from what we read in the pages of such authors as those of "The Moor and the Loch" and "Wild Sport in the Highlands," that the nesting of woodcock in Scotland was very rare; and it is within the memory of most of us that not in Scotland only, but all over the kingdom, the idea that the woodcock bred at all regularly in the country was hardly entertained. For a good many years it has been evident that a change of habit was taking place, the birds nesting with us in numbers that showed a steady increase. Of recent years the rate of this increase has been much accelerated, and in the present nesting season it is reported that some of the favourite coverts in many places, and especially in the Border district, are "full" of nesting woodcock. The actual figures returned by the keepers show, presuming their accuracy, that this is hardly a figure of speech. No doubt, in some parts the woodcock is beginning to be a fairly common nesting-bird.

THE AUTOMOBILE WORLD.

THE interesting announcement is made that a new body is in process of formation to which the Automobile Club is about to hand over its work in connection with the encouragement of the sport and pastime of motor-boating. Particulars are not yet forthcoming, though the reports in the Club *Journal* of the proceedings of the committees concerned in the matter indicate that the scheme will shortly be made public. The connection of the Automobile Club with marine motoring is hardly self-evident, and a disposition has been sometimes evinced to question its right to interfere in a sport which is more allied to yachting than to motoring in the ordinary sense. As a matter of fact, the Automobile Club took upon its shoulders the burden and expense of the necessary pioneer work for the reason that there was no other club in existence willing or able to take its place. The Marine Motor Association, it should be understood, is a purely legislative body, and holds in respect to motor-boating a position similar to that of the Yacht Racing Association in the case of yacht-racing. The organisation of races and competitions for the purpose of bringing into prominence the capabilities and advantages of the motor-boat was undertaken, as a temporary measure, by the Automobile Club, which appointed a special sub-committee to deal with the matter. It is now felt, we presume, that marine motorists are sufficiently numerous to manage their own affairs and to safeguard the interests of their pastime, and the new club, the latest offshoot from the parent body, will doubtless secure the support of everyone interested in this most delightful form of automobilism.

A DANGEROUS CORNER.

Crundall on a Humber, just before he ran off the course at the Auto-Cycle Club's Hill-climb.

HINTS FOR BEGINNERS.—I.

THE art of motor driving and management is not to be learnt from books alone. It can only be completely mastered in the school of practical experience, through the teaching of the workshop and the sometimes painful lessons of the road. At the same time, written instruction is not without its value to the novice, as a foundation upon which to build up a wider knowledge of the working of his car and a greater skill in meeting emergencies and diagnosing defects. These notes will therefore be of an elementary nature, and are intended mainly for the guidance of those numerous readers of COUNTRY LIFE who are about to join the ranks of automobilists or have only recently done so.

The working of the ordinary four-cycle petrol engine has frequently been described and illustrated in these pages, and it is therefore unnecessary to refer to it here. Premising this small amount of theoretical knowledge, there are two matters of vital importance to which the owner of a new car should immediately direct his attention. To avoid causing damage at a period of its life when the mechanism is most susceptible to careless treatment, he should make a careful study of the lubrication system. To escape early troubles on the road, he should thoroughly master the details of the ignition apparatus.

There are at least three different kinds of lubricant used on every car, and with which the motorist must therefore provide himself from the outset. There is the oil used for the engine itself, a thicker and cheaper quality for the gear-box, and grease for the screw-down lubricators which are fitted to certain of the important bearings. The engine oil may generally be employed for various minor working parts, but sometimes a thinner variety is preferred. Castor oil is also required for the clutch leather, and graphite grease for the chains. The most important of all, however, is the oil used for the engine. This should be of the highest quality and of a suitable nature for the particular type of motor fitted to the car. It is by no means necessary, however, to pay the extravagant prices charged when the oil is bought in small quantities. It is far more economical to purchase a 5gal. or 10gal. drum, which many of the best makers will supply at the rate of about 3s. a gallon. A quart tin, with a screw cap and a spout, should also be obtained for carrying on the car itself as a reserve. Gear oil is about 2s. or 2s. 6d. per gallon in bulk, while, as comparatively little is used, a 5lb. or 7lb. tin of grease is ample to buy at one time.

The motor requires the most constant and careful lubrication of any part of the car, as neglect in this respect will, sooner or later, result in a "seized" piston, and consequential damage which may be of a very serious character. The most usual method of keeping the engine supplied with an adequate quantity of oil is a sight-feed lubricator on the dash-board. From this a pipe or pipes lead to the crank chamber, the sight-feeds being adjusted to give the number of drops per minute prescribed by the maker or dictated by experience. These pipes, besides lubricating directly those portions of the motor to which they lead, generally the big ends of the connecting rods, also serve the important purpose of keeping the oil in the crank chamber at its proper level, so that the revolving cranks may splash the oil on to every part, including the cylinder walls. There is one correct level for the oil, though curiously enough very few manufacturers make any provision for ascertaining whether that level is maintained. Too much oil produces a smoky exhaust, and clogs the valves with carbon deposit, too little is detrimental to the engine, and results in loss of power. It is, therefore, somewhat difficult for the novice to hit the happy mean.

Perhaps the best guide, especially when the engine is new and requires, if anything, more than the normal amount of lubrication, is to feed oil to the crank chamber by means

THE INCOMPARABLE

"WHITE"

From the "AUTOCAR,"

APRIL 22ND, 1905.

"All the ancient disadvantages of a steam car—to wit, the failure to make steam after a rush uphill, the frequent stoppages to replenish the water supply, etc.—are past and gone with the 15-H.P. White. Fitted with a most efficient fan-cooled condenser, one tank full of water suffices for a run of 150 to 200 miles. Steam is seldom, if ever, shown, and the manipulation of the throttle valve alone serves to vary the pace of the car from a veritable crawl to the maximum speed obtainable. The brakes, moreover, though powerful and efficient, are only required for emergency stops; the throttle is sufficient and to spare for all ordinary purposes. The silent running is too well known to require emphasis, while the improved springing and lengthened wheelbase of the 15-H.P. make the car as comfortable and easy riding as any in the market.

"There are other points in relation to a White steam car with which I have no space to deal, but I may summarise the total of my week with a White by the remark that in the driving and handling of one of these cars those whose experience of automobilism has hitherto been restricted to the explosion engine will find many pleasant experiences."

HARRY J. SWINDLEY.

LIGHT CAR No. 3.

8 or 10 B.H.P.

APPRECIATION.

Dear Sirs, Carlisle, Feb. 28th, 1905.

The Car is going as well if not better than ever. A prospective customer for your Car, a Dr. G., of Heyes, wrote to me on your chauffeur's reference, asking for particulars of the Car, and for my opinion of same. I replied to him and gave him a favourable report, and advised him strongly to buy one; at the same time gave him some of the many good points of the Car, and promised to answer any further questions as to details which he might require. I hope you may succeed in booking his order. It will not be any fault of mine if you do not. I am glad to see good press notices of your Cars at the Olympia and Manchester Exhibitions. I know mine holds its own here in public opinion, and is always admired when seen by experts and others, the general verdict being that it is "about the prettiest Car ever seen on our roads," and astonishment is always expressed at its *quiet running*. Yours faithfully,

Messrs. Alldays & Onions. (Dr.) H. Y. T.

of the auxiliary hand-pump, until the exhaust shows a slight tinge of smoke when the engine is running fast. This will pass off in a few minutes, and so long as the sight-feeds are working properly there is little chance of the oil falling below its proper level. To make assurance doubly sure, an occasional stroke of the hand-pump can be given while on the road, and especially when the engine is working its hardest on a hill. No good motorist would tolerate the pungent clouds of smoke which seem so dear to the heart of the professional driver, but it is perfectly legitimate, before starting on a run, to satisfy one's self in the manner described that there is no chance of spoiling a valuable piece of mechanism through insufficient lubrication.

It will benefit the motor and conduce to its efficient working if the stale oil is occasionally drained off entirely through the cocks provided for the purpose, and a fresh charge introduced after the crank chamber has been flushed with paraffin. The engine should be revolved several times by hand and the paraffin allowed to drain off for an hour or two before the taps are closed and the clean oil pumped in. Some small cars are only provided with an oil pump on the dash-board worked by hand, and the usual direction given is to pump a charge into the crank chamber every twenty miles or so. I have generally found it better to give half a charge every ten miles, as the correct level is maintained better thereby; but the arrangement is at best a makeshift one, and a drip-feed should always be fitted if possible. At the same time, one of the longest-lived engines on the market is generally lubricated in this manner, and if proper attention is given to the pump the results are fairly satisfactory.

The inaccessibility of many change-speed gears often results in their receiving insufficient care in the matter of lubrication. A charge of thick oil is placed in the gear-box, and nothing further is done for perhaps some thousands of miles. I believe this to be a vital mistake. In the first place, the oil loses its virtue and the level is reduced by leakage. Far greater mischief, however, is caused by the fine particles of steel which are constantly being broken off the edges of the gear-wheels, however carefully and skilfully the speeds are changed. These mixing with the oil cause increased wear and tear on the face of the teeth, and are apt to find their way into the bearings, where they are obviously very much out of place. The gear-box should be drained every 500 miles or so, and fresh oil introduced, or the old oil might, perhaps, be filtered and made to serve again. Of course on a long tour this might hardly be practicable, but when the car is in ordinary use the lubrication of the gear-box is worthy of more careful attention than is usually given to it. F. P. A.

A STEEP GRADIENT AT THE HASLEMERE HILL-CLIMB.

The Gordon Bennett.

THE number of expert drivers who have publicly expressed their dissatisfaction with the course chosen for this year's Gordon Bennett race grows week by week. The latest is Rigolly, the breaker of many records, who has been studying the Auvergne Circuit on a 30 h.p. Gobron-Brillié. He states that he counted 145 really bad corners, and that only between Laschamps and Rochefort, and between Pontgibaud and Volvic, will anything like high speed be possible. Like all the other critics, he considers the course an exhausting one, and that only a driver in the best of training will be able to endure the strain. As for the cars, the race will test not so much the motors as the brakes, differentials, and tyres. Rigolly has narrated in a French contemporary an incident which illustrates the urgent need for some modification of the present intention to run the race without controls, apart altogether from the question of the risk to the competitors. After passing Bourg-Lastic, although only driving a touring car, he came up with a racer practising on the course. The Gobron was much the slower vehicle of the two, but Rigolly repeatedly caught up the big machine and tried to pass it. This, however, proved quite impossible, unless the racer ran on to the side path and stopped. Such conditions would be unspeakable in an actual race, as no driver would consent to stop in order to let a rival pass. The latest suggestion put forward in order to obviate this particular difficulty is to stop and restart the cars at those places which mark the commencement of the narrowest portions of the course. Otherwise, a competitor who had gained on his rivals during the open parts of the road might lose his advantage by being blocked by a slower car ahead when he came to one of the narrow stretches.

Mr. Austin, the manager of the Wolseley Company, has also been studying the Auvergne Circuit, and his opinion of the course coincides with those of the other experts whom we have frequently quoted. He was able to discover only one really straight piece of road, and that was merely about four kilomètres in length, with a very bad surface. We reproduce a photograph of one of the turnings taken from the back of the car on which he was travelling.

Rumours have been current for some time past that the Hon. C. S. Rolls will drive one of the Wolseley cars in the Eliminating Trials in the Isle of Man. No definite announcement has been made on the subject, but it is a fact that Mr. Rolls made a very close study of the Isle of Man course during the Easter holidays. Six rounds were made on one of the heavy 20 h.p. Rolls-Royce cars, which are specially designed to carry limousine and other covered bodies. Of course, it is possible that the journey was also undertaken for the purpose of making experiments for the Tourist Trophy Race, for which two Rolls-Royce cars are entered.

A Difficult Hill-climbing Task.

Glorious weather, a private road in perfect condition through Mr. Philipson Stow's estate at Blackdown, near Haslemere, an exceedingly stiff hill, and a large and representative entry were the conditions which favoured the Auto-Cycle Club's hill-climb on Saturday. The climb starts at the lodge gates which face Windfall Wood Common, the height above sea-level being 268ft., and the road goes steadily uphill for over a mile. At the point a mile from the start a height of 720ft. has been attained, so that the average gradient is about 1 in 11. For 200yds. the gradient is 1 in 8, and about two-thirds of the way up the hill there is a right-angled bend, when the gradient jumps to 1 in $4\frac{1}{2}$ for nearly 150yds. The hill is thus exceptionally steep, and the need for caution in negotiating the sharp corner badly conflicts with the equal need for rushing up to the commencement of the sharp pitch. Mr. Stow dispensed his hospitality to the officials of the club in a very quiet and unostentatious way; but he must have gone to considerable expense in preparing the course and carrying out the arrangements. In the class for machines with engines having a cylinder capacity not exceeding 76m.m. by 76m.m., two out of seven competitors surmounted the hill, F. Hulbert on a $2\frac{3}{4}$ h.p. Triumph covering the mile from a flying start in 2min. 28 4-5sec., A. F. Ilsley on a $2\frac{3}{4}$ h.p. Phœnix taking 2min. 38sec. Four of the others stopped on the steep pitch, and one (a two-cylinder Werner) on the 1 in 8 portion. Class 2 (engines not exceeding 80m.m. by 80m.m.) did not produce even such good results. The winner was A. E. Lowe on a 3 h.p. J. A. P., whose time was 2min. 31 4-5sec. (or 3sec. slower than the first man in the previous class),

BROTHERHOOD . . CAR . .

(20 H.P. 4 CYLINDERS).

"We had an opportunity of trying the new Brotherhood, under the expert control of Mr. Percy Richardson, who has been mainly responsible for its production. The point which struck us most was the excellence of the Carburetter, which allowed of the engine running efficiently at something like 150 revolutions per minute. In fact, Mr. Richardson drove us for miles through traffic without ever taking the clutch out, and at times the pace was a regular crawl. The control is altogether effected by a side movement of the right foot. There could not possibly be an easier way of application or more instantaneous. In fact, taken altogether, the control of this car is perfect. We noticed, too, that it picked up with extraordinary rapidity. At one moment we would be crawling through dense traffic, then an opening would suddenly occur, and a slight movement of the toe would send the car bounding forward like a projectile, only to be pulled up further on, as the traffic closed in, almost as quickly. The way Mr. Richardson handled the car was a liberal education in what can be done with a good motor. In this car the flexibility of the engine was good, while for power it seemed extraordinarily efficient, to judge from the one or two short bursts we were able to indulge in."—*Extract from MOTOR NEWS, March 4th, 1905.*

BROTHERHOOD-CROCKER MOTORS, LTD.,

19, HANOVER SQUARE, LONDON, W.

whilst the second man was R. W. Ayton on a 3 h.p. Triumph, whose time was 2min. 42 4-5sec. Five machines of equal calibre failed on the stiff part of the hill and one on the milder gradient. The 85m.m. by 85m.m. class did better, six out of eight overcoming the task. J. Hancox on a 3¼ h.p. Roc covered the mile in 1min. 58 1-5sec., T. Silver on a 3 h.p. Quadrant being second in 2min. 9 4-5sec. The other times were: 3½ h.p. Roc, 2min. 35 2-5sec.; 3½ h.p. Ormonde, 2min. 59 3-5sec.; 3¼ h.p. Rex, 3min. 7sec. Class A was for motor-bicycles with engines of any size, and the absence of most of the high-powered machines was a fortunate occurrence rather than otherwise. The 7 h.p., 8 h.p., and 10 h.p. machines would never have rounded the corner. As it was, the crowd were wisely put back 20yds., J. F. Crundall, who made fastest time, doing 1min. 48 2-5sec., sweeping right over the grass on which the people had previously been standing, his pace at the corner being quite 35 miles per hour, for his average speed was over 33 miles per hour; Crundall rode a 5 h.p. Humber. E. D. Fawcett on a 4 h.p. Bat took the corner in good style, and was second in 2min. 7 3-5sec. Wilbur Gunn on a 5 h.p. Lagonda took 2min. 30 2-5sec., and J. B. Walford on a 3½ h.p. Ortona took 2min. 52 3-5 sec. for the journey. The only starter in the light fore-car class was A. F. Ilsley on a 4¼ h.p. Phœnix with two-speed gear, but he, unfortunately, punctured. Wilbur Gunn's 10 h.p. Lagonda made best time for the two-passenger machines, covering the distance in 4min. 4 4-5sec., whilst Crundall drove his 6 h.p. Humber up in 4min. 31 1-5 sec. During the day some of the cars essayed the climb, but the gradient was manifestly too much for most of them.

A MOTOR-BOAT FOR HARBOUR DUTY.
Built by Messrs. Thornycroft for the Swedish authorities.

THE MEDITERRANEAN MOTOR-BOAT RACE.

Seven boats reached Algiers and were made ready for the race across the Mediterranean to Toulon, Mr. Thubron's Mab not being able to be got ready in time. The race could not be started until six o'clock on Sunday morning last, on account of the weather, but the sea was practically calm then. The starters were Mercé'ès-Mercédès, Mercédès C.P., Camille, Malgré Tout, Quand-Même, Heracles II., and Fiat X. Heracles II. and Malgré Tout broke down very early in the contest, and were taken in tow by the torpedo-boat destroyers which accompanied the contestants. Seventy miles out Fiat X. had secured a substantial lead over Mercédès C.P., whilst Quand-Même was lying third. Fiat X arrived at Port Mahon at 9 p.m., having completed the first stage of the race in fifteen hours. The distance is 198 sea miles, so she must have averaged 13 1-5 knots. Camille, with Mme. du Gast on board, was second.

MIDLAND AUTOMOBILE CLUB CONSUMPTION TRIAL.

To-day the Midland Automobile Club will hold a consumption trial for touring cars over a circular course, starting from Wishaw Hall Farm, which is eleven miles from Birmingham, and situate just off the main road between Coleshill and Lichfield. The competition is confined to members of the club. Each car will be supplied with the same kind of spirit, and will be officially weighed after the tank and carburettor have been filled and sealed. At the finish of the trial, the tanks and carburettors will again be filled, and the car and load weighed. The amount required to fill the tanks at the finish

HERON MOTOR CO., 89 & 91, John Bright Street, BIRMINGHAM

A MARVELLOUS ACHIEVEMENT.

LONDON to COVENTRY on TOP GEAR WITHOUT TAKING OUT THE CLUTCH, USING THE BRAKE, OR CHANGING GEAR!

THE ROAD FROM LONDON TO COVENTRY.

This splendid performance was accomplished, under the surveillance of the Editor of the "Autocar," by the

4-CYLINDER COVENTRY HUMBER CAR.

The Editor of the *Autocar* writes in the issue of May 6:

"The start was made upon the third speed, the clutch being clipped sufficiently to allow the engine to pick up its load. This it did immediately, without the least shock. Thence onward the control was entirely by the throttle, with an occasional touch of the ignition lever. The long inclines up to Tally Ho Corner were taken with the greatest ease on the top gear, and the car showed such a reserve of power that we had not the least doubt, even at this point, about its completing its performance, and it ran right through without once changing the gear. The engine is perfectly balanced, and runs with the greatest smoothness. It is an exceedingly well designed engine; in fact, its performance proves that the same remarks apply to the car throughout. It was proved that the car had a very high turn of speed indeed. So far as we are aware its performance for a car of its size has not been equalled."

NO FINER EVIDENCE CAN BE GIVEN OF THE FLEXIBILITY AND POWER OF THE HUMBER ENGINE, EVERY PART OF WHICH IS MADE AT THE HUMBER WORKS.

This performance was accomplished on a Standard-pattern, Coventry Humber, three-seated Car, selling for 240 guineas. Complete specification of Humber Cars post free on application to

HUMBER, LIMITED, Works, BEESTON (Notts) and COVENTRY.

JOHN I. THORNYCROFT & CO., CHISWICK, W.

of the trial, plus any spirit taken in during the competition, shall be taken to be the amount consumed. Any competitor, however, may elect before being weighed at the start to have such a quantity of spirit removed from his tank as he chooses, and in that case at the finish, after his tank has been filled, and before his car is weighed, an equal amount shall be removed from his tank. The carrying of passengers is optional, a somewhat questionable proviso, as if a vehicle without passengers makes a good record no one can possibly know to what extent economy of consumption is due to absence of load. Sufficient time will be allowed for the cars to proceed over the course within the legal limit. Three medals will be awarded by the club, viz., a gold one as first prize, and silver and bronze respectively for the second and third. The formula upon which the prizes will be given will be:

$$\frac{\text{Weight of Car and Load.}}{\text{Quantity of Spirit Consumed.}}$$

The contest should provide interesting results, inasmuch as it is a long time since anything of the kind was held, and no one has any means of knowing how current types of cars compare with each other in the matter of economy of fuel consumption. Now that supplementary air regulators are so general, of course this item in the working cost of a motor-car ought certainly to manifest an improvement; but there is very little evidence on the subject that is available to all and sundry. The fact of the International Tourist Trophy Competition in September next being largely in the nature of a fuel test renders the Midland contest still more interesting.

A STEEP APPROACH.

The daily task of a White Steam Car belonging to a Pittsburg motorist.

SOME MOTOR-CYCLING FIXTURES.

To-day the first of the Auto-Cycle Club's penalty runs for members will be contested, the competitors having to ride 100 miles out and home, and to pay into the pool sixpence for every stoppage. The club provides the nucleus of the prize fund, and if three or fewer than three competitors go through without mishap they will take the whole of the pool in prizes. If more than three get through, some other method of division will be arranged. The contest created a large amount of fun last year. The idea is better suited to a place-to-place run, however.

It has now been decided that the eliminating trials for the selection of a team to represent Britain in the International Auto-Cycle Cup Race will be held in the Isle of Man on Wednesday, May 31st, the day after the Gordon Bennett selection trials. The distance of the race will be $163\frac{1}{2}$ miles, or three times round the course, which is $54\frac{1}{2}$ miles long. The riders will be started in small batches at intervals of about two minutes. Eighteen entries have been received, whilst for the race for the *Motor* Cup, which will be run concurrently, the entries so far total nineteen, the date of entry having been extended to May 13th, in consequence of the postponement of the event.

AN INDIAN MOTOR SERVICE.

A new motor service has been established in India in connection with the Madras Railway between Bezwada and Masulipatam, and three 10 h.p. Turner Miesse steam cars have been selected for the work. Each vehicle has a carrying capacity of eight passengers, together with luggage and mails. On February 19th a trial trip was made over the whole route, a distance of 44 miles. A full load of passengers, including the Postmaster-General, was carried, and we are informed that an average speed of $22\frac{1}{2}$ miles an hour was maintained. The fare between the two places has been fixed at Rs. 2. 8 per head. As is well known, the fuel used on the Miesse cars is ordinary paraffin, which costs Rs. 3 per 4gal. tin. With a full load the consumption is said to average about $12\frac{1}{2}$ miles to the gallon.

MOTOR VOLUNTEERS IN GERMANY.

The German Automobile Club, acting in concert with the Minister of War, has formed a Corps of Automobile Volunteers. Prince Henry of Prussia is the head of the new body, and Baron von Brandenstein the General Director. The corps consists of owners for at least six months of petrol cars of not less than 6 h.p. The owner must be certified as able to drive his car with proper carefulness, and during his periods of instruction must be accompanied by a driver who must also be the holder of a certificate. The volunteer automobilists will have to undergo annually three periods of training, each of ten days' duration. The corps will take part in the Imperial manœuvres which are to be held in the autumn.

ITEMS.

The first annual dinner of the Roads Improvement Association will be held at the Trocadero Restaurant on Wednesday, May 17th. Tickets may be obtained from the hon. secretary, 16, Down Street.

In consequence of the number of cars registered in London being on the point of reaching 10,000, the Local Government Board has assigned to the county the additional index letters L.C.

The British Empire Motor Trades' Alliance, whose object is to assist and encourage the home industry, is compiling a register of British manufacturers of automobiles, motor-engines, component parts and accessories. The register will be available for both private and trade enquiries.

The *Motor World*, Scotland's automobile organ, has now come under the editorship of Mr. W. Gray Nixon, who has served his apprenticeship on the staffs of two of the leading English motor journals. Another interesting appointment is that of Mr. Jeyes, for a long time assistant-editor of the *Standard*, who has undertaken the editorship of the *Automobile Club Journal*.

The German Emperor has ordered a 24 h.p. Fiat.

We illustrate on a previous page the new Thornycroft motor-vessel undergoing her trials in the Thames. She has been built for harbour duty in Sweden, and is 55ft. long, 8ft. 6in. beam, and draws 3ft. of water. The propelling machinery consists of two 108 h.p. motors and twin propellers of a new reversible type of Messrs. Thornycroft's design.

The Society of Motor Manufacturers will give a dinner at the Hotel Cecil on Friday, May 19th, when Dr. Ormandy will read a paper dealing with the necessity of obtaining from the Government greater facilities for the manufacture of alcohol for industrial purposes. According to a communication which we have received from the society, the motor industry is not satisfied with the report of the Alcohol Committee, and intends to use all means possible to draw public attention to what it regards as a most important question in regard to the future of automobilism.

The Motor Car Emporium, Limited, has secured the output for this country of the heavy vehicle department of Messrs. De Dion, Bouton and Co. of France. It is hoped that the first double-decked omnibus of this make will shortly be running in London. We are informed that this will be the forerunner of over 100 other vehicles of this make.

CORRESPONDENCE.

SIR,—In your issue of April 29th, under the heading of "Motorists and Dogs," you refer to a recent letter of mine to *The Times*, and make the following comment: "Mr. Greene, in a later portion of his letter, unconsciously refutes his own allegation as to the fast driving of the car. . . . He states specifically that it passed through Hurstbourne Priors at four o'clock, and the village of Whitchurch at 4.15. The distance between these two places is just two miles! On his own showing, therefore, he proves the car to have been travelling at the rate of eight miles an hour, and how any accusation of furious driving can be laid against a driver who proceeds at so moderate a speed, it is difficult to understand." If you will kindly refer to the letter in question, you will see that, so far from making any specific statement as to the times given, I expressly qualified each with the word "about." "About four o'clock" was quoted from the nurses, "about 4.15" from the police-constable who saw the car pass through Whitchurch. The times throughout were distinctly quoted as approximate, and were, of course, given solely for the purposes of identification, not as indications of excessive speed.—H. PLUNKET GREENE, Hurstbourne Priors, Hants.

LITERARY NOTES.

GOOD literary essays are hard to find nowadays, and we are all the more inclined, therefore, to extend a hearty welcome to *In Peril of Change* (Unwin), by C. F. G. Masterman. Here is a thoughtful and clever writer who is trying to take a steady, sane, and rational view of the time in which he lives, its movements and people. The eyes that look out on it appear to be a little sad, and the pages of the book are full of that "divine discontent" which so often characterises very high talent. Mr. Masterman's theory, or rather assumption, is that in the later years of the Victorian era, and in the early part of the twentieth century, we were in the middle of a literary reaction, and the school at which his fiercest attacks are levelled is that of the late W. E. Henley. His opinion is that Henleyism, in so far as it was an attempt to be natural, was a relapse into paganism; in so far as it was imperial it was a mere affectation. The men who wrote "Songs of the Sword" had never themselves fought in, or witnessed, war, or knew its horrors, and when the conflict broke out in South Africa the reality of it put their fanciful descriptions to flight, and people would no longer listen. In other points Mr. Masterman thinks that William Watson is nearer being on the right side than Mr. Kipling. It is an interesting view for him to take, and would have been valuable if it had been speculative instead of so very dogmatic as he has made it. The author does not see things in their due proportion, and as it were "hymns the greatness" of many who have no claim to anything beyond mediocrity at all. His account of Mr. Henley, for instance, is a very superficial one indeed. Mr. Henley's was no new spirit. His was not even a formative mind; one of his close friends on a certain occasion described him as a steam engine to grind out other men's ideas, and this was a very accurate description. But

THE BEST LIGHT CAR.

Look at this reliability record for one year, 4,572 miles covered.

EXTRACT FROM LETTER RECEIVED FROM A MEDICAL MAN.

MESSRS. JARROTT AND LETTS. CORNWALL,
DEAR SIRS, *March 8th*, 1905.

"I completed my first year's running on the 5 h.p. OLDSMOBILE I had on Feb. 16th, 1904, and think you may like to hear how I've got on. I had **no previous knowledge of cars,** and have looked after the car myself. **It has been out almost every day,** and there **has never been a day on which the car was not fit to run. . . . . It has run in all weathers,** including **frost and snow,** over an **extremely hilly country;** most of my hills have **a grade of 1 in 6 (measured)** somewhere on them. **In the twelve months I have covered 4,572 miles, and have never had a tow. . . .** The car has the **record of having climbed the worst hill** in my district **without having to turn out its passengers. The 'Olds' has been such a boon that I cannot say too much in her favour."**

Yours very truly,
(Signed) MONTAGUE W. ROE.

This speaks for itself and proves that the

OLDSMOBILE

Accomplishes everything and goes anywhere.

if it be so, it quite knocks the bottom out of Mr. Masterman's essay. On the other hand, there are several very appreciative passages, of which we will give the following:

"It is for the child elements that he will stand in literature. He possessed a child's quick apprehension of the sensuous aspect of things—the dying year and the coming of spring, night and the sea in storm, and all the magical world of out-of-doors. He loved with a child's delight the pageantry of war, the sword's 'high, irresistible' song, the bright flash of steel, and the tramp of armed men. He had a childlike, unreserved love of England, expressing in a few magnificent ballads the mystery and sacredness of a Patriotism rare in these latter days. And in the most appealing and universal of all his poems, it is the child shrinking from the Unknown and the Future: the child that has suffered so much wistfully asking the meaning of it all: the simple, pitiful note of fear and surprise of

'The terror of Time and Change and Death,
That wastes the floating, transitory world.'"

If Mr. Masterman will turn to the poem that Mr. Henley contributed to the Christmas Number of this journal just previous to his death, he will find a key to some part of the poet's character that he has quite missed. Perhaps the most instructive chapter in the book is that devoted to Spencer and Carlyle, where he brings out the contrasts between the two men in a very complete and delightful manner. We put two passages side by side, of which the first relates to Spencer:

"Spencer describes his early friendship with George Eliot, 'The most admirable woman, mentally, I ever met.' He took her to the opera and the theatre, where he had free admissions, more used 'because I had frequently—indeed, nearly always—the pleasure of her companionship, in addition to the pleasure afforded by the performance.' He was then but thirty-two, and the philosophy had scarcely been projected. There were out-of-door walks, discussions on the terrace outside Somerset House. 'People drew inferences.' 'Quite definite statements became current.' 'There were reports that I was in love with her, and that we were about to be married. But neither of these reports was true.' In the reflections at the end, forty years afterwards, some indication of the reason was revealed. He had described in painful detail her actual physical appearance. 'Usually heads have here and there either flat places or slight hollows; but her head was everywhere convex.' He had once criticised a great beauty, alike in face and figure, 'I do not quite like the shape of her head.' 'This abnormal tendency to criticise has been a chief factor,' he sadly acknowledged, 'in the continuance of my celibate life.' 'Physical beauty is a *sine quâ non* for me; as was once unhappily proved where the intellectual traits and the emotional traits were of the highest.'"

And with this should be read the following from the Carlyle portion of the chapter:

"Each obscure human life was for him a matter of infinite import. London, as he looked down on it from the Surrey hills, 'its smoke rising like a great dusky-coloured mountain, melting into the infinite clear sky,' became a meeting-place of Eternities in the 'everflowing stream of life and death.' In the graveyard of the dead, where 'they all lay so still and dumb, those that were once so blithe and quick at sight of us; gathered to their sleep under the long grass,' the old man 'could not forbear a kind of sob, like a child's, out of my old worn heart, at first sight of all this.' Read if you can without emotion the letter, magnificent in its simplicity, in which Carlyle describes to his brother in Canada the last days and death of his mother. It is the end of an obscure life, full of toils and sorrows; the dust returning to the earth, as it was, through that last indignity which is the common lot of man. But to the eyes of one watching with a love unconquered by the fretfulness of time, the voyage of this humble soul 'through the gloomy clouds of death' was charged with a solemn splendour and triumph. All the mystery of the greatness of human existence gathered round the moment of the passing into eternity of the spirit, returning to the God who gave it."

The practice of publishing biographies of living men is not one to be entirely recommended. Whoever undertakes the task is bound either to get into personal contact with the subject of his memoir, or risk being inaccurate. Mr. J. P. Alderson's *Mr. Asquith* (Methuen) is open to this criticism and many others. A biographer who has to chronicle such small beer as that Mr. Asquith when he misses the ball in golf never says anything stronger than "Dash it all!" has been reduced very nearly to the inane and futile. Many of the chapters, too, read simply like abridged reports from *The Times*. We might take that called "In Opposition—Part II." as an example. It gives an account of the dinner to Sir Alfred Milner on the eve of his departure to South Africa in 1897. That is the beginning of the chapter, and the rest is a mere summary of the speeches delivered on this and other occasions. At intervals the author seems to feel himself bound to give opinions of the Press, such as those commonly attached to advertisements of books or sent in by a Press-cutting agency. "*The Times* says," "the *Daily News* says," "the *Westminster Gazette* says" are constantly-recurring phrases, and we frequently come across such information as this, "the *Birmingham Daily Post* says, commenting on it as 'an uncommonly good maiden speech.'" Mr. Asquith, fortunately for himself, has a reputation so solid that even the ridicule to which this sort of stuff is likely to give rise will hardly do any permanent harm; but, at the same time, we cannot help saying with some emphasis, that the growing practice of publishing biographies of men who are still in the height of their activity is most unbecoming and undignified.

Animals I have Known (Unwin), by Arthur H. Beavan, is a lively account, written, as we are informed in the preface, without reference to scientific theories or the origin of distribution of the animals the author has met with in various countries. In the book will be found much lore full of interest to our readers, particularly in those chapters which deal with the badger and the wild cat, the fox, otter and seal, the hare, the rabbit, and other inhabitants of our woods and fields and coasts. Chapters are also given to some of the British domestic animals, such as horses and donkeys, dogs and cats. Then comes the author's experience of animals encountered by him in Australasia, on the West Coast

IN ENGLISH HOMES.

THE INTERNAL CHARACTER, FURNITURE AND ADORNMENTS OF SOME OF THE MOST NOTABLE HOUSES OF ENGLAND HISTORICALLY DEPICTED FROM PHOTOGRAPHS SPECIALLY TAKEN BY

CHARLES LATHAM.

This large and handsome volume measures 16in. by 11¼in., and contains about 200 full-page plates and 150 smaller plates, illustrating "Our goodly English Dwelling-places, those houses which have been sanctified by the passing of centuries."

Published at the Offices of "COUNTRY LIFE," Limited, 20, Tavistock Street, Strand, W.C. and by GEORGE NEWNES, Ltd., 7-12, Southampton Street, Strand, W.C. New York: CHARLES SCRIBNER'S SONS.

of South Africa, the river Plate, and Brazil. It is a volume full of information for the elementary student of natural history, and this information is conveyed in language that is simple and free from pretence or intellectual swagger of any kind. A word might be said as to the illustrations, some of which are fairly good, but it would be an improvement to state where they came from, and what is meant by the apparently silly caricature opposite page 82, called "Hedgehogs Skating."

ON THE GREEN.

CERTAINLY the St. Andrews course is responding kindly to the care and money that are being expended on it so much more liberally than in the days of old. We have advanced since the time when the idea seemed to be that a golf course could "run" itself without any necessity for fostering care. The greens are far better than they used to be, and the lies through the green are certainly no worse, which is much to say, considering how the golf has increased. Moreover, the tees have been put far away back, so as to stretch the course and make its distances as nearly as may be equivalent to what they were before the ground was so hard packed that the ball runs for ever, and before the Haskell introduced a new measure of golfing distance. All this is said of the old course, but it may also be noted that the new course is now very good, and really almost justifies the brave assertion of many that it is as good a course as the old. For all that, if they have the option, very few will play on the new course from preference. In spite of the tees being put back, there is no doubt that the classic course is easier than it used to be, because the whins guarding the sides have virtually gone. Many bunkers have been dug to take their place, but they are not nearly as ubiquitous as the whins were, and although the general meeting of the club last week authorised the making of many more bunkers, still they will not pervade the path of error as the whins once did. But all the work that they will do in punishing the crooked goer will be, so far, good work, in the interests of better and more accurate golf. When the Spring Medal was competed for last week the course was heavy in consequence of abundance of lately-fallen rain, the ball did not run much, and the distances were good and testing. The day was altogether as favourable for golf, and for good golf, as a kind providence possibly could have bestowed on a never sufficiently grateful people. The general ingratitude was shown by the figures of the returned scores, which were, as a rule, no better than they should have been. On such a day, with such a field, there should have been at least half-a-dozen scores under 80, instead of which only two were returned below that round number; 79 was scored by Mr. C. Wedderburn, who thus won the second medal, and Mr. Pease won the first medal with a really rather remarkable score of 76. What makes the score remarkable is that it included a six at the short hole coming in. This is a hole that ought by rights to be a three hole, and this means that the rest of Mr. Pease's round was equivalent to a total score of 73; 73, as the course was laid out, that is to say, at greatest possible length and with some of the holes, such as the eleventh, the sixteenth, and the seventeenth, placed not in the centres of the greens, but in the most catchy corners, is a score that can hardly be made without a little luck coming to the aid of very good play, and the very fact that Mr. Pease had four threes in his score, although he missed his legitimate three at the second short hole, is a sign of some luck in itself. But it was his turn to have a little luck, because everyone has known for a long time that he was a very sound player, and yet he has never before won a medal at St. Andrews. All things do not come to all those that wait, as has

The "Exmoor" Side Saddle Hunting Coat & Skirt,

AND THE

Famous "Roscut" Coat.

Riding is, undoubtedly, a pastime to be appreciated. You will appreciate it the more if you are a wearer of the "Exmoor" Hunting Coat and Skirt for Side Saddle, or the "Exmoor" Astride Coat and Skirt for the new method of riding which the title explains and which is undoubtedly the coming mode, as being hygienically correct and far less fatiguing. The above mounted figure represents the "Exmoor" Side Saddle Coat and Skirt, and its refined appearance (it imparts an additional air of grace to every figure); its splendid style and workmanship; above all, the delicious feeling of snug comfort it affords to the wearer; have so appealed to ladies of taste and discernment that it now ranks as an essential to the full enjoyment of riding.

The advantages of the "Roscut," shown in the dismounted figure, over the ordinary style of Coats for going to Cover, Riding, Driving, Walking, and, indeed, all out-door Exercises, are many—sufficient if we say here that it is made in the most fashionable and durable materials; can never go out of fashion; is of a convenient width in the folds; is perfectly waterproof, but at the same time porous and odourless. Made in light and heavy weights, to suit the requirements of the wearer.

been said, but they come to some of them. To Mr. Pease came not only the glory of the medal, but also the financial opulence of the sweepstakes. Handicapped to owe two, he just beat Mr. Wedderburn, who started from scratch. The two heaviest handicapped men in the field were Mr. Maxwell and Mr. E. Blackwell, each at plus four.

A. H. Toogood has fairly established himself in the position of rival to the three great men, Taylor, Vardon, and Braid—a position which he has been challenging rather shrewdly lately—by beating them all for the Tooting Bec Cup of the Professional Golfers' Association. Braid has won this cup, I think, in each of the previous years in which there has been a competition for it, but this year he had to take equal third place with Harry Vardon at 153. Toogood was 151, and Taylor had a putt at the last hole of the thirty-six to tie with him, but failed. The arena of the contest was Northwood, and its result is most interesting, as putting Toogood up along with the three acknowledged leaders. His performance in the open championship at St. Andrews will be keenly watched.

The Sussex County championship, played at Rye, was won by a team of the Ashdown Forest Club, Mr. O. C. Bevan of the same club returning the lowest individual score. This is the second time that the Ashdown Forest Club has won this championship. HORACE HUTCHINSON.

POLO NOTES.

THE polo season has begun with the Ranelagh Handicap Tournament, and next Saturday will see the final of the Eden Park Opening Tournament. The weather has been cold, wet, and changeable, and the winter garden at Ranelagh has drawn a good many spectators, and caused us to praise the foresight which, in our variable climate, has provided such a refuge for those who have to look on. However, we are not cast down, for we recollect what a bad beginning we made last season, and how much we enjoyed ourselves before the close. So may it be now. In the meantime, we may note that all the grounds are in excellent order, and that whereas ten years ago polo players had but two grounds in London, now there are eight well-kept polo and three practice grounds, but little inferior to the playing grounds. As to players, we have indeed some losses, for Mr. John Watson has finally retired, and Captain Marjoribanks is in South Africa. On the other hand, Mr. G. A. Miller has come back. Mr. John Hargreaves was in excellent form at the Blackmore Vale Tournament last week, and we are to have a new team—Moreton Morrell, Messrs. C. Nickalls, Garland, and C. L. R. Grenfell, which will, no doubt, be engaged in some good tournaments in London. Mr. Buckmaster played for this team in the final of the Warwickshire Spring Tournament, and showed that he was in his usual form. He is captaining a team against Rugby next Saturday at Roehampton, and that should give us a match worth seeing. Of other teams the Magpies (soldiers past and present), Handley Cross, and the Tigers will all be seen out next Saturday. After this week we shall probably, if the grounds are playing well, have a very fair idea of the form of most of our leading players of 1905. It is too early to write yet of the newcomers, but great things are hoped from one or two players who came out last year. Messrs. Carr, Garland, and Barrett should all be valuable additions to the strength of English polo. We are also looking forward to seeing Mr. Crane, who belongs to the famous Dedham, Mass., Team, more than once winners of the American championship. Like Mr. Foxhall Keene, who, by the way, is also over here, Mr. Crane is an all-round sportsman. As Mr. Agassiz is also coming, and Mr. L. McCreery must be allowed to be an American, we ought to have one or two international matches of considerable interest to give variety to the season. Writing of American polo, I am not surprised that the American Polo Association has allowed stick crooking. It was an open secret that several of their leading players were in favour of this change, and it has been expected for some time. At the same time, however, that this change was made, the associations made known their objection to anything like an "off-side" rule. As it is well known, that while the majority of players in England and India are agreed on the desirability of retaining "off-side," there are many people who consider that the present rule requires some modification, it is hardly likely that the American Polo Association will consider the matter until we have made up our minds in this country. Perhaps a less severe penalty in cases where No. 1 is put off-side in consequence of a defensive manœuvre of the opposite back would be the best solution. Then, again, "off-side" should not be allowed merely because it is claimed, but only when the umpire has seen the rule violated with his own eyes.

The Ranelagh Polo Committee—Lord Harrington (in the chair), Major Milner, Captain Fitzgerald, Major Stanley Barry, Mr. Gill, and Captain Jenner—met last week to consider the conditions of certain leading tournaments. The Army Cup, which is a challenge cup presented by Colonel Frowde Walker, C.M.G., for officers past and present, will be played for June 12th—17th under the following conditions: Teams may be composed of officers past and present of Household Cavalry, Dragoons, Dragoon Guards, Hussars, Lancers, Royal Artillery, Royal Engineers, Brigade of Guards, and Infantry. The idea is that teams will be selected to represent these different branches of the Service. But if a regimental club wishes to enter a complete team, they can do so provided two players are selected from past officers of the regiment. The winning team is not to be eligible for the Novices' Cup. The Subalterns' Tournament (July 10th to 15th) will be open to all regiments, whether of the Regular Army or the Auxiliary Forces. Two battalion regiments or those quartered in London or within a forty-mile radius can enter composite teams. In the same way the Hunt Tournament conditions have been altered and improved. A player to qualify must have hunted ten times with the Hunt he represents, or have subscribed not less than £5 to its funds. Only one man whose name is on the recent form list can play in each team; the winners in the Hunt Cup, which remains an open tournament, are not eligible to play. These two tournaments, the Hunt Cup and the Hunt Tournament, ought to prove attractive to the many polo players who are also members of the various Hunts. The restrictions are wise, for just now the Warwickshire Hunt could put a team of overwhelming strength in the field. X.

RACING NOTES.

THE First Spring Meeting at Newmarket is always looked forward to with pleasurable anticipation by those who take a real interest in racing for its own sake, and to lovers of the thorough-bred horse there is the added interest of seeing for themselves to what extent the candidates for classic honours have improved since they retired into winter quarters, and of endeavouring to discover amongst the two year olds, now making their first appearance in public, some colt or filly whose name may become enrolled for ever in the annals of equine fame. Dealing first with the two year old form, it would appear that too much reliance should not be placed upon the result of the First Spring Two Year Old Stakes, a remark which probably will be found applicable to not a few of these abominable four furlong scrambles, which for some inscrutable reason have received the approval of the Jockey Club. As far as the two year olds seen out during the Guineas week are concerned, Noisy Bill Crathorne (the recently named colt by Donovan out of Lady Lena), and Gemma were the best of the known lot which took part in the First Spring Two Year Old Stakes on Tuesday. The first-named has made decided improvement since his first appearance, and he is such a beautifully bred colt that he may be expected to show even better form in the future. Gemma although possessed of a tremendous turn of speed, is none too powerful of build, and her defeat was principally owing to the fact that she could not give the weight away. Crathorne is a really good colt; he will be better served by races over a longer distance, and ran well under the substantial burden of 9st. 6lb. In Black Auster, by Persimmon out of Crusado, Sir E. Vincent owns a colt of great promise; he is a fine upstanding animal, with plenty of substance and racing-like quality, and is sure to be well worth following. Parlamante, a chestnut daughter of Simontault and Star, is also a useful filly, and was running on strongly at the finish. The Maiden Two Year Old Plate brought out, amongst others, Sir J. Miller's colt by Sainfoin out of Aida, and Lord Howard de Walden's Peter Jackson. The former is one of the most perfectly balanced and symmetrical two year olds one could wish to see; if he has a fault it is that he is, if anything, too "set," and too much developed to leave much room for improvement, but taking him all round he is a remarkably nice colt. Peter Jackson, on the other hand, is very lengthy, and has size, scope, and quality enough to develop into a really high-class racehorse; both of these colts were beaten in the race itself by Mr. L. de Rothschild's Sonnet, by Lactantius out of Zobeyde, an extremely sharp and active filly, but it is doubtful if she will ever again finish in front of either of the other two. Snow Glory, by Ayrshire or Ninus out of Perce Neige, who ran second in the Wilbraham Plate for two year olds on Wednesday, is a very nice filly, who will win plenty of races, but neither she nor any of the other competitors had the slightest chance of beating Sweet Mary, a flying daughter of Cyllene and Auricula. I did not notice any two year old of much account in the Maiden Two Year Old Plate, but there was no mistaking the racing capacities of Black Arrow, the winner of the Newmarket Two Year Old Plate, for which, although there were eighteen runners, 11 to 8 was freely laid on this son of Count Schomberg and Black Cherry, who spread-eagled his field in remorseless style, and cantered home with his ears pricked six lengths in front of his nearest attendant. He is certainly the best two year old colt seen out up to now, and many congratulations were offered to his popular owner and breeder, Mr. W. Hall-Walker after the race, only to be renewed with even more heartiness when Cherry Lass, by Isinglass out of Black Arrow's dam, placed the One Thousand Guineas to the same gentleman's credit.

With regard to the three year olds which took part in the Two Thousand Guineas, little that is good can be said, and unless Cicero should come to the rescue, it is difficult to see from whence will spring a champion capable of withstanding the onslaught of the French-bred son of Flying Fox. Vedas won, it is true, by two lengths, but to my way of thinking he had had quite enough of it, and taking a line through Signorino on the book he could never expect to finish in front of Jardy, who in the Middle Park Plate last year gave 7lb. to Signorino, and beat him in hollow fashion. Mr. Henning's Rouge Croix is a very commanding colt, with every appearance of a racehorse of the highest class, but he was palpably backward, so much so that he looks more like being ready to run for the St. Leger than for the Epsom Derby; be that as it may, unless he totally belies both his looks and his breeding, he will win more than one good race for the Heath House stables.

The First Spring Meeting commenced very quietly on Tuesday with the Two Thousand Guineas Trial Plate, which Mr. R. Hanbury's Sauterelle won by a head from Mr. G. Lambton's Zanoni. The victory of Sir E. Cassel's Exchequer proved to be but the first of a series of terrible disasters for backers, who experienced a severe blow in the following race, the First Spring Two Year Old Stakes, in which Kempton Cannon brought off a 20 to 1 chance on Mr. Homan's Noisy Bill, who won by three-quarters of a length from Black Auster, with Parlamante just beaten into third place by a head. In the betting Gemma was a hot favourite at 11 to 10, 7 to 4 was the best offer against Crathorne, 100 to 8 Black Auster, and 20 to 1 any other. It has already been pointed out in connection with this race that too much reliance must not be placed upon the order in which the horses finished, and from a betting point of view it would be advisable to treat the book form of the race with the utmost caution. Lord Dalmeny had the satisfaction of seeing his recent purchase, Ritchie, win the Hastings Plate of 500 sovs. at the remunerative price of 8 to 1, Mr. D. Baird's Fusilier and Lord Durham's Flashlight filling second and third places respectively. The prettiest race of the day was that for the Maiden Two Year Old Race, and, curiously enough, Kempton Cannon once more was on a winner which started at 20 to 1, his mount, Mr. L. de Rothschild's Sonnet, by Lactantius out of Zobeyde, just beating Sir J. Miller's beautiful colt by Sainfoin out of Aida by the shortest of heads, with Lord Howard de Walden's slashing colt, Peter Jackson, third, two lengths behind the leaders. The concluding race of the day, the Apprentices Handicap Plate, brought no relief to backers, for another complete outsider, in the shape of Mr. D. Marnes's mare, Guilty, upset the favourite, Gay Gordon, who could only struggle into third place, two lengths behind Sir Willliam, who was beaten a length and a-half by the winner.

"Full of those items of First Aid Knowledge, both surgical and medical which are indispensable to the Household."—LONDON DAILY EXPRESS.

ELLIMAN, SONS & Co., SLOUGH, ENG.

The match between Lord Cadogan's Frusquinette and Lord Wolverton's filly by Ugly out of Bramble Jelly, with which proceedings commenced on the Wednesday, savoured somewhat of a farce, for it is difficult indeed to know how bad either of the performers are. It is, however, worth noticing from the fact that by permission of the stewards the use of the starting-gate was dispensed with, and that badly as both of these animals had started in the First Spring Two Year Old Plate on the previous day, they were infinitely more difficult to start without the gate than with it. Two of the races on the day's programme consisted of the new four furlong scrambles, to which the Jockey Club are evidently giving a thorough trial, and it is most earnestly to be hoped that, apart from their own opinions, they will give some heed to the almost universal outcry against this useless and misleading form of racing. In the Wilbraham Plate for two year old fillies, Mr. D. W. Clarke's charming filly, Sweet Mary, gave us another exhibition of her speed, and won by two lengths from Snow Glory, to whom she was conceding 9lb.; Queen Camilla was only beaten a head for second place, and should be worth remembering at Kempton Park. The runners for the Two Thousand Guineas have already been taken stock of, and there is but little to add, except perhaps to notice how accurately the result of the race bore out the opinion of an eminent trainer, who remarked, as they went down to the post, "They are all bad, and the fittest of them will win." With one exception, I quite endorse his opinion that they are a very moderate lot, and, as regards condition, there is no sort of doubt that Vedas was the "fittest" of the lot; in fact, his trainer, Robinson, received numberless congratulations, not only upon winning both the Two Thousand and the One Thousand Guineas, but also upon the splendid condition in which he sent his horses to the post throughout the week, with regard to which it seems that the great majority of the Newmarket trainers are of opinion that they are under great disadvantages in their endeavours to get their horses fit to run, owing to the needless and arbitrary restrictions placed upon the use of the different gallops on the Heath, and, as far as one can see, they are perfectly justified in their complaints. As to the race for the Two Thousand Guineas, it can only be described as disappointing and uninteresting; the two year old form of last year, which was anything but good, was reproduced quite in accordance with the book, and Vedas, quietly and steadily ridden by H. Jones, won by a couple of lengths, with a head dividing Signorino and Llangibby for second and third places. The apprentice Evans showed to great advantage in the Selling Plate, when he drove the Braw Lass filly home a short head in front of Tongue Tied, ridden by Otto Madden. Captain J. Orr Ewing's Song Thrush by Missel Thrush—of whom, by the way, an excellent picture appears in another part of this week's COUNTRY LIFE—won the Three Year Old Handicap by a head from Sir E. Paget's Singaway; and Mr. H. Lindemere wound up the day by winning the Mildenhall Plate with Outbreak.

No one had been found possessed of sufficiently sporting instinct to challenge for the time-honoured Whip, for which Lord Durham's Osbech was indulged in a walk-over by way of starting the racing on Thursday, which does not call for much comment, except to notice that Nabot, with a tremendous pull in the weights as compared with the City and Suburban, cantered home for the March Stakes in front of Whitechapel and Flower Seller, the latter of whom ran sufficiently well to draw attention to his chance in the Kempton Park Jubilee Handicap. Black Arrow won the Newmarket Two Year Old Plate in grand style, and Mr. G. Thursby rode his first winner at Newmarket in the Mile Selling Plate on his own horse Aggressor.

Few trainers have hitherto had the satisfaction of training the winner of both the Two Thousand and the One Thousand Guineas. Matthew Dawson did it in 1875 with Camballo and Spinaway, and again in 1879 with Charibert and Wheel of Fortune. Pilgrimage, trained by T. Cannon, won both these races in 1878, and in 1885 Charibert and Wheel of Fortune were sent out to win these races by John Porter, and as recently as 1902 both of these classic contests were won by the famous Sceptre. Vedas and Cherry Lass have now accomplished the feat for the famous Foxhill stables, presided over by W. Robinson.

Nineteen fillies went down to the post for the One Thousand Guineas, and when, after a short delay, the barrier flew up Koorhaan was the quickest beginner and got well away, followed by Lindal; then came Cherry Lass on the left, Queen of the Earth, Renaissance, Chain Stitch, Jongleuse, Chiavenna, Galantine, and Amitie; so they ran to the Bushes, where Cherry Lass was apparently beaten, and swerved on to Queen of the Earth, and I rather think that Koorhaan was a sufferer also. McCall, however, straightened Cherry Lass, and, riding with the utmost determination, the filly answered gamely to his efforts, and, forging ahead once more, wore her opponents down and won rather easily by a length from Koorhaan, who beat Jongleuse into third place by three lengths. The successes of the Foxhill stable and the brilliant riding of George McCall were the principal features of the week's racing, and, curiously enough, Melayr, also trained by Robinson, and sold only the day before the race, won the Bretby Stakes for his new owner, Colonel Kincaid-Smith. At Kempton Park, on Friday, Ravilious may win the Manor Plate, Noisy Bill the Spring Plate, and Roseberry, if reports are true, should run well for the Stewards' Handicap; and on Saturday Romer, Ambition, or Flower Seller should supply the winner of the Jubilee Handicap. TRENTON.

SUNRISE ON THE MARSHES.

DAY is breaking over sea and earth, and the world seems filled with a great cold greyness. The slow-growing light is dimmed and strangled by heavy mists that roll in from the sea, hugging every hollow, blurring every line, and chilling every object with their clammy touch. The waning moon still struggles to shed a thin and sickly light that pales before approaching day, and one by one the stars die out. A deep stillness reigns over the low-lying levels, and only the distant droning of a steamer's foghorn can be heard on the damp-laden air. Meanwhile the mist-billows

"Soap deferred maketh the dirt thick."
The Proprietors of WRIGHT'S COAL TAR SOAP offer
£10 IN PRIZES.
A Sovereign will be given to each of the 10 persons sending the BEST EXAMPLE of a PERVERTED PROVERB suitable for advertising a Soap.
EXAMPLE: "Hope deferred maketh the heart sick."
PERVERTED PROVERB: "Soap deferred maketh the dirt thick."
All replies will receive very careful consideration. Any number may be sent, but each one must be attached to the outside wrapper of a Tablet of Wright's Coal Tar Soap. Ladies competing to use a wrapper of the Toilet Soap, and gentlemen a wrapper of the Shaving Soap. Sold everywhere, 4d. per Tablet.
The decision of the Managing Director must be considered final.
Latest date for receiving replies, May 31st.
Address—
Proverb Competition, Wright's Coal Tar Soap,
66 & 68, PARK STREET, SOUTHWARK, S.E.
The result will be advertised in the "Daily Mail" on June 30th.

creep on and on, drenching the grass and covering the clothes with minute beads of moisture that look like a mildewy rime. The grey grows lighter, but the mist increases; and now a gentle patter, as of falling rain, can be heard along the waterways as heavy drops roll from the dank-withered reeds that bend beneath their weight, and the growing grass straightens but slowly where the boot has pressed it down.

Further on the clang of a closing marsh gate is answered by the startled bleating of young lambs, and shadowy forms are seen on all sides, the munch, munch of grazing ewes being plainly audible in the breathless stillness. But soon the murmuring sea is heard, then the distant cries and pipings of wildfowl on the misty ooze-flats; and grass gradually gives way to sand. Suddenly, like a miniature mountain range, the dunes rise up in front, and the rich marsh pasture becomes more coarse—till now spiky herbage and tussocks of wiry grass are all that sparsely clothe the sand. The murmur grows to a dull roar, for the top of the hills is reached, and a breeze blows gently in from the sea, driving the fog before it—and suddenly the world is light. To either side the sand-dunes stretch away in tawny, undulating mounds, and straight ahead the creamy breakers pound upon the open beach. The cool air strikes sharply on the brow; grey turns to white, white to yellow, and then the mist disperses around, recoiling inland before a flood of light. From under the clear horizon come great glowing beams, and the sea turns a deeper blue. Crowds of gulls stand packed on the gleaming spits and hail the morning with loud, hoarse calls, while others skim and drift above like spectres, light as thistledown. Further off, where the ooze lies deeper, a herd of curlews is gathered at the water's edge, some feeding, some sleeping, but the inevitable few alert and keen for any sign of danger.

And now there is a burst of gold, and the edge of the sun has appeared. Up and up he comes in a blaze of dazzling light, and soon stands over the sea to stare at an awakening world. The sullen mists creep inland and disappear in filmy wisps, and there is in the air a tremor of true gratitude. Soaring larks pour out their morning song, and the rich grasslands glisten in the blessed light. The colt's-foot raises its drooping head, and the starry celandine opens timidly to the warm caress. From the topmost branches of the pollard willows mellow-voiced thrushes shout their richest notes, while shank and plover wheel around with wild and joyous cries. A hare, startled from her form near by, bounds off and dashes through the long, coarse grass, scattering the dew in glittering showers. Then a heron, taking warning at her mad race, lurches forward on his ample wings and flies heavily away to a more distant fleet.

It is, indeed, a chorus of joy that rings over the flat, patient marsh. The sweet freshness of the morning air, the cloudless sky, the sights and sounds of early dawn, the timid ripple of awakening spring—what else can equal these when one would be alone, yet not alone, with Nature at her best? The earth seems better, purer, at this hour—the birth of untarnished day.

But now from far away come other figures which cast long shadows after them. They move slowly, and from many points. These are men, men who come to work and toil that they may live—the day is, indeed, begun. WALTER J. FALLON.

ODDS AND ENDS.

THE Midland Railway Company send us their annual guide for holiday-makers throughout the British Isles. The principal feature in it is the list of lodgings available in seaside and country districts, which will make the choice of locality an easy task for those who have large parties to consider. The company, having acquired the North of Ireland railways, draw special attention to that district and the Isle of Man, and this illustrated book will be sent free to anyone on application.

—o—

ONE does not usually accuse the merry little wren of having apiarian tastes, but a gentleman who keeps bees, says that, noticing some of his hives becoming weaker and weaker, he kept a look-out to try to find a cause. Seeing that a couple of wrens were almost constantly about the hives he shot one of them, and opening it was surprised to find it stuffed with bees! It is a pity to think that this pretty little bird should take to such naughty ways, but it was evidently a "true bill" in this case, at all events.

—o—

As a locality for feeding at lunch-time, the Strand is already unrivalled; and yet, no doubt, a blank has been apparent to old frequenters of it during the time that the Gaiety Restaurant has been closed for rebuilding. This last week has seen the reopening of this famous house, and, apart from its cuisine, the visitor cannot but be struck by the luxurious and rich way in which the interior has been furnished and decorated by Messrs. James Shoolbred and Co.

—o—

THE roads are getting into good order; the parks hint to the cyclist how delightful he will find the country lanes in the lengthening evenings; and in good time Messrs. Rudge, Whitworth, Limited, send us their catalogue of "cycles" for this season. The name of this firm is a guarantee that the workmanship will be found reliable, and their highest price stands at £15 13s.; while the fact that each new design has had to face a final riding test of some 5,000 miles in a month, is a proof that no pains are spared in their efforts to provide a really good machine at whatever price it is listed.

Made in one quality only.

Dewar's
The Whisky of MANY Merits.

I HAVE just returned from Paris, whither I ran over for a few days to inspect the latest ideas in frocks and millinery. It is in the hats that the dominant note of the year has been sounded. The dresses are exquisite this year, the authorities having wisely restored to us the long close-fitting lines which make every woman look her best; but there is not so distinct and complete a change in the dresses as in the hats. The tilt, the slant, and the perpendicular are the three most salient features of Parisian headgear at present. The tilt is universal; every hat on a fashionable head, whether in the Bois, at Ritz's for tea, at the races, or at the theatre in the evening, is tilted on one side and forward to an amazing degree of Louis XV. impertinence. With hats at such an angle, it would be impossible to place feathers or aigrettes in an upright position; hence the slant of all trimmings. This is most accentuated in the sheaves of straight feathers, such as quills of all sizes, or peacock's tail feathers, which are most popular. The brim of the hat (all the brims are very narrow in front, and very wide at the back, which suggests at first the idea that the hat has been put on hind side before!) is pinched up over the left eye, and the sheaf of quills laid thereon, slanting almost horizontally backwards. The back of the hats are built up, whether the brim is turned up or not, with bows of soft ribbon or flowers to about 6in., which gives the forward tilt desired. An exceedingly smart woman had a hat of electric blue straw built up in this way to such a degree that the hat, viewed in profile, was very nearly perpendicular. It is curious to compare in one's mind's eye a silhouette like this with the mushroom hats and early Victorian bonnets of last year! Many of the hats have been evidently inspired by, if not actually copied from, pictures by Watteau, Lancret, or Nattier. Their shepherdesses would certainly have found these pretty, tilted, rose-wreathed, be-feathered little hats altogether to their taste; and one in Leghorn straw with pastel blue velvet ribbon, shaded blue ostrich feathers interwoven with a sheaf of silver and gold wheat-ears, looked altogether appropriate in one of the boxes at the Variétés during the sumptuous scene at Versailles under Louis XV., for which all the exquisite costumes were designed by Gerbault. I have never seen more lovely dresses on the stage; and if they caused a revival of the paniers, and the square-cut, long-pointed bodices, which make the bust look so full and the waist so slender, it would not be surprising. In the meantime, however, though we have the long-pointed effect in our corselet belts and bodices, we are still allowed the slender lines of hip; and I was particularly delighted with a dress of Doucet's, whereof the skirt was cut entirely on the bias in two pieces, which were joined in front and at the back in the only two seams the skirt possessed. The material was the finest satin cloth, in colour between champagne and apricot; the cloth moulded the hips like wax, but swept out round the feet in the fullest folds. The cut and fit were the whole beauty of the skirt, which was absolutely devoid of all trimming; and to be worn with it was a bodice of silk muslin in the same colour, heavily gauged on thick cords where the fronts crossed over, and trimmed with a tiny frill of kilted apricot silk, with an edging of Valenciennes lace. The bolero, to be worn out of doors, was of the apricot cloth, a mass of mysterious folds, and trimmed with very fine embroidery in self-coloured silk and silver. All the wraps for afternoon and evening wear in Paris at present are exceedingly voluminous; the sleeves are mostly copied from those of kimonos or Chinese coats, and nothing could be more truly feminine than these masses of drapery in delicate colours. One in brilliant orange cloth gave me an even greater spasm of envy than Mlle. Lender's cloak of ruby velvet, with gold embroideries and sable, that she wears in "L'Arge du Foyer," and that set all Paris gasping. My orange cloak (alas! that the possessive pronoun should be simply figurative!) was very long, and a voluminous mass of folds; the fronts and the kimono sleeves were edged with a wide band of silk embroidery in shades of dull Chinese blues, the opening of the sleeves where the hand emerged being marked by cascades of lace. Large silk tassels of blue, orange, and gold weighted the different points of the sleeves; and the cloak was lined throughout with kilted pale blue chiffon, which gave a shimmer of colour over the orange lovely beyond words. This cloak, of course, was for

AN ORIGINAL DRIVING WRAP.

evening wear; but another cloak, which would serve equally well for the afternoon or for the evening, is the one illustrated on this page, which was unusually graceful and original in design. It was of very fine cream satin cloth, lined with taffetas

glacé in the palest young leaf green. The skirts of the cloak were cut in three receding steps in front, and again in smaller points at the breast, the outline being marked by two rows of trellis braid of white silk intermixed with silver threads, the wider braid at the edge and a narrower one following it with about 1½in. of space between. The sleeves were somewhat like the shoulder-piece of an Inverness cape, cut in one with the rest of the cloak in a mysterious but most graceful fashion; and they, too, were finished in square steps like the fronts of the cloak, and edged similarly with the double line of braid. The fronts of the cloak did not meet; and in between was a little waistcoat of bright green velvet not quite reaching to the waist, over which it hung in bolero fashion. This little velvet vest was edged with silver braid, with simulated knots like buttons, though the vest really fastened with invisible hooks and eyes. The pointed fronts of the cloak were finished with large tassels of white silk and silver. The gleam of the pale green taffetas lining, visible whenever the wearer moved, had a most charming effect, and the velvet waistcoat made the cloak a good deal warmer garment than it looked. For wear in a carriage or at a smart race-meeting, such as Longchamps or Auteuil, nothing could have been better devised; and many were the compliments received by the happy wearer, for originality and grace in so hackneyed a garment as a driving wrap are not always easy to attain. I should like to see this cloak copied in fine black cloth, with black silk braid, lined with blue taffetas glacé, and a waistcoat of Royal blue and silver; it would be a delight to the eye and a far more useful garment for daily wear than the original in cream cloth and pale green.

There is nothing in which contrast is so attractive as in the great question of clothes; and after having drunk deep at the fountains of Doucet, Beer, Paquin, and all the other big houses in Paris, I returned to London with a distinct desire for one of those workmanlike tweed dresses which are alone to be obtained with satisfaction in England. Burberry's, therefore, claimed my attention at once; and I give a sketch of a tweed dress for country wear or travelling, which quite delighted me. It is the perfection of the true "tailor-made," admirable in cut and in workmanlike smartness. The material is a tweed, soft to the touch, but of a hard close make, greenish grey in colour, with a dull golden brown line outlining the big squares of the woven pattern. The skirt is quite plain, except for a stitched panel in front, with tabs and buttons at intervals, and a double pleat inserted below the revers to give extra width and comfort in walking. The half-length coat is tight-fitting at back and sides, with transverse pockets in front, and is fastened with two buttons placed rather low, which has a becoming effect in lengthening the waist-line, which is also increased by the long revers of the turned-down collar. The sleeves are perfect in their simplicity, and are finished with a neat cuff. As the coat is intended to be worn over a plain shirt, there is no vest, for such things are not needed in summer. The hat is made of the same tweed, with a soft stitched brim that can be turned up according to the pleasure of the wearer, and is trimmed with a band and knot of satin ribbon and an upstanding wing. It is a delightfully complete and smart costume, which would be invaluable for hard wear, and has quite as much individuality in its outline as all the "creations" I saw in Paris, for in this particular section of dress nothing can equal a London tailor.

SKETCHED AT MESSRS. BURBERRY'S, HAYMARKET.

It is the way of modern commerce to operate on a large scale, but it is not often that some £35,000 worth of art furniture is offered to the public in one sale, and at a rate of reduction which brings these beautiful objects within the reach of persons of moderate means. This is what Messrs. Oetzmann and Co. of 62-79, Hampstead Road have done and are now doing; for they recently purchased for this large sum the whole of the stock of Messrs. Norman, Stacey, and Co., Limited, of Tottenham Court Road, and are now offering it for sale at reductions that vary from 30 to 50 per cent. off the original prices. In addition to this, purchasers can, if they prefer it, pay on the deferred instalment system, which is often particularly convenient to young couples who are starting housekeeping. To those who cannot visit the sale personally, Messrs. Oetzmann will send, post free, on application a fully-illustrated sale catalogue, from which they can make their choice without further trouble. The catalogue covers the whole range of house furnishing from garret to basement, and particular attention may be called to the beautiful drawing-room furniture, the immense range and variety of carpets and bedroom furniture, and the admirable specimens of antique furniture from the well-known collections of the late Duke of Cambridge, Marquise d'Auban, and others.

Talking of furniture reminds me of the triumphant success which has been achieved by Messrs. Shoolbred in the new Gaiety Restaurant, which everyone is rushing to see. The furnishing has been particularly happily treated, as regards being in keeping with the Adam style which prevails throughout the building. The pearl velvet hangings of the Masonic Temple, the comfortable curule chairs in green morocco, and the splendid blue carpet accentuate the beautiful proportions of the room, with its marble columns and frescoed ceiling; and the three private dining-rooms, alongside the green and white Adam

Suction Gas Producer.

GENERATION OF ELECTRICITY BY

SUCTION GAS

PLANT.

Recent Test of a Typical Plant, from August 6th to November 5th, 1904, 1628 units used, 330 lights fixed, showed a cost for fuel consumption of about ONE-THIRD OF A PENNY PER UNIT generated.

N.B.—The results usually published are apt to be misleading, for they omit such items as loss in conversion, labour, oil, etc., which will raise the total working cost to about twopence per unit.

2d. per unit is approximately equivalent to lighting by coal gas, at 1/6 per 1,000 cubic feet.

A unit equals 15 lamps of 16 c.p. burning for one hour.

The earliest of our installations with Suction Gas Plant has been working successfully

SINCE 1899—

being one of the first installations erected on this principle in England.

PRACTICAL ENGINEERS are sent, free of charge, to obtain particulars and advise generally.

THE **S.S. SYSTEM**

of Electric Lighting
—the result of 20 years' experience—
is fully described in

47, Spring Gardens, Manchester; 50, Wellington Street, Glasgow.

banqueting hall, are furnished with a degree of taste worthy of the three former stars of the old Gaiety, Nellie Farren, Kate Vaughan, and Fred Leslie, whose names are inscribed in letters of gold over the doorways.

The rage for silk is one of the most notable features of the fashions of this year, and Messrs. Liberty's latest creation in silks is likely to create a sensation, so distinct and original is it in every way. This "Aurora" silk is not a glacé, but is delightfully soft and yet substantial, taking most beautiful folds in draperies; it has an opalescent surface, and is made in a great variety of parti-coloured "shot" tints which are quite beautiful in effect. One of the loveliest is a silver grey, shot with rosy mauve and pale green; and another is a wonderful blending of copper, gold, emerald, and turquoise, all blended so subtly that the general effect is subdued though magnificent. For day and evening dresses and blouses the "Aurora" silk would be difficult to surpass in effect, and the price of 4s. 6d. a yard, with a width of 28in., is distinctly moderate for so original and uncommonly beautiful a material.

The medical authorities have recently been launching out into diatribes against the use of alcohol for fatigue and depression; but now that the ruck of the season is upon us, something is needed by most people to help them through the fatigues of social life. Nothing will supply this want better than Fry's Pure Concentrated Cocoa, which is both a stimulant and a food at the same time. Our forefathers recognised its benefits, as far back as 1656, when the fashionable chocolate houses and the famous "Cocoa-Tree" were first established; but then it was a luxury for the rich alone. Now the popularity of the beverage is universal, for its great benefits have been recognised by science. In Fry's Cocoa the consumer has a light refreshing beverage of most easy digestion and rapid assimilation, and a cup of fresh cocoa will be found the very best kind of "pick-me-up" imaginable, for there is none of the reaction caused by the momentary fillip given by alcohol; on the contrary, the sense of exhilaration is accompanied by the nourishment of the body, so that the result is unalloyedly good. LAMIA.

LITERARY NOTES.

IT is a very great pleasure to have on our table at one and the same time two books of poetry, written by contributors to COUNTRY LIFE. Mrs. Tennant has happily chosen for her book of verse the title *Windlestraw* (the Chiswick Press), and she has modestly taken for her motto three lines from Herrick:

"A little stream best fits a little boat,
A little lead best fits a little float,
As my small pipe best fits my little note."

Of her work our readers are very well able to judge. The best she has done in our opinion are those verses in the Wiltshire dialect, some of which appeared originally in our pages. "The Fire o' Logs," "The Bee and the Butterfly," and "Jack o' Lantern" would all be worthy of a place in any collection of dialect poems. Next to them we would be inclined to place those verses which have some local reference. Mrs. Tennant's mind is, indeed, full of her neighbourhood, and one of the men with whose memory it is closely associated has, undoubtedly, been an inspiration to her. We mean George Herbert. One of her poems to him is entitled "With a Volume of the Temple," but Herbert's influence is felt more in those which have no direct reference to him. As an example of the rest of her work we cannot do better than quote the legend of the Ass:

"'What means the mark upon thy back, dear Gris?
I trace it on thy shoulders as I ride,
Slender the cross it seems that shadowed is
Even to thy side.'

'Well may'st thou ask of me who bear'st this sign,
Albeit unseen upon thy tender brow,
Are we not signed with the self-same sign,
Even I and thou?

Behold an heritage; and who may know
What mystic virtue the great sign contains?
Where is the hardship of the cruel blow
Of whip and reins?

Nay, when Life's bondage is so harsh and rude,
Dawns a far vision that all sorrow calms,
We hear the shouting of the multitude,
We see the palms—

And all else falls from us. It matters not
If we with suffering keep patient tryst.
We, as a race, O child, may share thy lot,
We have served Christ.'

The grey ass halted in her pattering pace,
High-hoofed and obdurate, sleek-eared and mild,
A world of wisdom in a velvet face
Turned to the child.

'So have we patience. And in fortitude
Do thou wax stronger as the years pass on,
So shalt thou in thine heart, a living rood,
Carry God's Son.'"

Mrs. Tennant is entitled to the credit of having written a thoughtful, unconventional, and inspiring book of poems.

The other lady contributor whose new book is before us is Miss Ethel Clifford, whose "Songs of Dreams" must live in the memory of many readers. She dedicates it to her mother, and the first two lines are a little wistful and pathetic:

"I think the spell is gone from out my singing,
The music from my songs."

But Miss Clifford may take heart of grace. She endeavours perhaps to do too much, and might do worse than remember the old command, "To do but little, yet do that little well." In *Love's Journey* (Lane) she is a little given to harping on one idea. Such a sequence as "The Song in the Orchard," "The Song on the Hill," "The Song by the River," "The Song by the Willow," "The Song in the Beech Wood," "The Song by the Mill," "The Song by the Larch Wood," "The Song in the Valley" appals the reader by its very appearance in the "Contents." But that the music is not gone from her singing will be apparent to anyone who reads the following:

"THE SENTENCE.

Oh! to be leaving the green earth
And the skies above;
The gladness of sleeping and waking
And the glory of love.

To be losing the still waters,
The rivers and streams,
To be losing hope and remembrance,
Thoughts and dreams.

To be dead to the wonder of winter,
The miraculous spring,
The marvel of sunlight and moonlight,
Of leaves and of blossoming.

To hear nor the wind's whisper,
Nor the song of rain,
To be one with those that are vanished,
And come not again.

To be passed beyond the rose-trees
And their shadows beneath,
To yield life's certain kingdom
For uncertain death."

Miss Clifford possesses a very great talent, but she requires to bring the exercise of it under control, and to be a little more self critical.

A poetess of quite another description is Lady Mary Sackville, whose *Hymn to Dionysus, and Other Poems* (Elkin Mathews) is now before us. Her work is all at a high, but none of it at the highest, level. As an example we may quote one verse from "A Ballad of Change":

"O where is Greece and all her power,
Her songs and her philosophy,
Her gods who shed a golden shower
Of beauty over earth and sea?
All past, all vanished utterly;
Plato, the great Republican,
Aspasia eke and Pericles:
Time lays them all beneath his ban;
And every man shall pass as these."

The Carthusian Memories (Longmans), by Dr. Haig Brown, transports us into another world. The book consists of trifles done by a scholar. There are prologues to plays, occasional verse, hymns, translations, school songs, and other compositions such as we might expect from a leisured scholar, who is able to rhyme in four or five different languages. As a specimen of it we may give the following verse written for an album:

"Dear Mariquita, if my skill
Bore due proportion to my will,
I'd write you for your album's proem
A bright and charming picture-poem;
But four score years have dulled my wit,
And age has left me all unfit
To make such dainty verse as might
Be pleasing in a lady's sight;
Let me, my want of power confessing,
Give you herewith an old man's blessing."

There are many other minor poets lying on our table, but from a casual glance they would be worth noticing only to gibbet, and doing that is rather a thankless task. They belong to that class of warblers whose productions go to fatten the waste-paper basket. One often wishes it were possible to convey to them some such rules as the following: 1. No poem will be accepted that has for its subject spring, summer, autumn, or winter. 2. The months of the year are also barred, and it is useless to indite melodies to January, February, March, April, May, June, July, August, September, October, November, or December. 3. Short shrift will be given to every poem beginning with Alas! Oh! or Beloved. It would easily be possible to extend these rules, because there are several others that might be attended to with advantage, both to the contributors and the recipients of their favours. But the main objection to the minor poet still remains to be stated. He and she, to use a slang expression, always go for the subject in a manner that is too bald-headed. They are of the four-and-four-make-eight style of writer. They wear their hearts on their sleeve. They are entirely lacking in what the French call *esprit*.

In case they do not know what we mean we will, for their benefit, quote what is, in our opinion, one of the finest examples of minor poetry extant, viz., John Dunlop's song:

"Oh! dinna ask me gin I lo'e thee,
Troth, I dar'na tell;
Dinna ask me gin I lo'e ye,
Ask it o' yersel'.

Oh! dinna look sae sair at me,
For weel ye ken me true;
Oh, gin ye look sae sair at me,
I dar'na look at you!

And bonnier lassies see,
Oh, dinna, Jamie, look at them,
Lest you should mind na me.

For I could never bide the lass
That ye'd lo'e mair than me;
And oh, I'm sure my heart would break
Gin ye'd prove talse to me!"

THE PRINCE OF WALES'S PHEASANT.

LAST YEAR'S BIRDS.

OF all the sportsmen interested in the proposals to add to our stock of wild pheasants some of the fine breeds of Central Asia and Mongolia, Colonel Marsden Sunderland is, we believe, the only one who has practically succeeded in doing so. It should be said, by way of premise, that the Mongolian pheasants constantly mentioned in the reports of the United States Game and Fisheries Commission are only the ordinary Chinese, or ring-necked pheasant, Phasianus torquatus. That very fine pheasant, Phasianus Mongolicus, with white shoulders, and an interrupted and very broad neck-ring, though procured and turned down by the Hon. Walter Rothschild some years ago, does not seem to be obtainable, pure bred, anywhere in the country. Doubtless, when the war is over, the demand—which, judging from the number of enquiries sent to COUNTRY LIFE, is considerable—for the pure-bred Mongolian breed will be met. A large variety of the torquatus, with an interrupted ring, much wider than that of the ordinary Chinese ring-necked pheasant, is pretty common in pheasant farms, and is sometimes advertised as Mongolian, but it is not. The Prince of Wales's pheasant has much in common with the Mongolian in its appearance, though it is not so large and heavy. On the other hand, it has the white wing coverts, or shoulders. But whereas in the Mongolian a creamy white (over the whole of the wing coverts) and a splendid deep bronzy red are the main theme of the colouring, the Prince of Wales's pheasant, though it has the white wing, has, as a rule, no ring round the neck whatever.

At the same time, it cannot be considered certain that this pheasant *never* has a white ring. It has a fairly wide distribution, and probably where it comes in contact with ring-necked breeds there will be signs of a ring. Of the members of the Afghan Boundary Commission with whom Colonel Sunderland has corresponded, three feel pretty sure that some of the cocks had white feathers on their necks, while another is equally positive that they had not. The colouring is also made very rich by the spangling with blackish purple or black. The Chinese ring-necked pheasant is the hardiest of the two species now common in our coverts. But there is very good reason to think that the Prince of Wales's pheasant is a very hardy bird also. This is inferred from its great abundance in the places where it is indigenous. With every kind of vermin eager to attack it, and no check upon any of them, from eagles and kites to wild cats and leopards, the life of a pheasant in the reed-beds of the Marghab River cannot be altogether a happy one. Yet when the officers of the Afghan Boundary Commission were able to snatch a moment from their arduous labours in the service of their country, they sometimes bagged fifty in an afternoon. "It is extraordinary what a number of pheasants there are in the reed-beds of this valley," was the remark of one of the officers. "This year they seem more numerous than last. I know no country in the world where one can get such good wild pheasant-shooting as here. On the 21st we brought in a bag of seventy-two birds, and as on the first day lost a good many wounded." While marching thirty miles up the river 500 were killed. Yet the climate is severe in winter, and the summer no longer than ours. It would seem particularly well suited to wet and low-lying coverts, for it is reported to be so fond of water as even to swim.

After failing in an experiment with imported eggs in 1901, Colonel Marsden Sunderland went out himself, in 1902, to Asiatic Russia, and obtained a number of these pheasants. He brought them back safely and established them in very large enclosures, rather than pens, at Conholt Park in Hampshire, at the end of February, 1903. It is evidence of the good constitution of the species that they stood the journey well, and quite recovered before the spring from their long confinement. They were a little late in laying, as might be expected, but, beginning at the end of April, laid freely. In one pen the average was thirty eggs per hen. They hatched very well, and were quite as easy to rear as the chicks of ordinary pheasants.

AUTOMATIC FEEDING TROUGH.

Colonel Sunderland wisely carried out his experiment on a very considerable scale, with the object that the fine breed he was introducing should not be regarded as, or become, what is known as "aviary pheasants." He enclosed whole fields as pens for a few birds each, with wood and arable inside the enclosure. This answered admirably; indeed, though the first lot were pinioned, it was most difficult to catch them. The pens were sown with buckwheat and corn, which were allowed to stand, and were surrounded with wire-netting 10ft. high. The hens, which acted as foster-mothers, ran at large with the broods.

Towards the end of the year the birds were moved to Findon, near Worthing, where enclosures on the same ample scale were made. Each contains three acres of arable land, wood, and pasture, and the arable was sown right out with corn and buckwheat early in the year. Consequently, the birds bred this year will be as wild as those of the first season. The ground has been so

CARTRIDGES OF EVERY DESCRIPTION A SPECIALITY.

selected that each pen runs through three sections of a different surface. The site is on the slopes of the South Downs facing the sea, by no means remarkable for a mild climate, but rather the contrary. Even the little poults are wilder than hawks. Unlike the ordinary tame pheasant poults, which will run up to a stranger if he throws food, these are mainly invisible after being turned out with the hens. Even when very small, in the coops they are nearly as shy. C. J. CORNISH.

THE GAME LAWS.

ALTHOUGH an owner of land is, generally, absolutely entitled to everything above and below it, and it is a maxim of the law that "he to whom the soil belongs, to him also belongs all above it, even up to the sky (and all under it to the depths below)," yet, legally, there can be no absolute possession or property in wild animals until they are captured; a person can only have a qualified property in them so long as they remain on his land. The basis of the law of property is physical possession, and we can have no power over wild animals in a state of Nature, though, of course, with regard to domestic animals—such as horses, cows, sheep, etc.—a man may have as absolute a property in these as in any inanimate thing. Wild animals reclaimed or confined become qualified property, but immediately they escape from confinement the property is gone, and the rights of the owner are lost. "Bees which fly from, and out of, my hive are mine so long as I can keep them in sight and have power to pursue them. If a swarm lights on my tree I have no more property in them till I have hived them than I have in the birds which build their nests there." So wrote Bracton in the reign of Henry III., and such is the law to-day. It may be observed that the Game Laws have not made this qualified property absolute, as they mi ght have done. The Acts do not give the absolute ownership of wild animals to the landowner, so as to make their taking larceny; the various Acts only give special rights to the owner and others for the protection of the game.

The means adopted have been to make trespass a criminal offence, punishable with great severity, and to restrict, by a system of licences, the right as well of killing as of selling game. As regards the acquisition of title to beasts and birds, the following points are worthy of notice: "If a man starts any animal on his own ground, aud follows it into another's and kills it there, the property remains in himself. If (being a trespasser) he starts it on another man's land and kills it there, the property belongs to him in whose ground it is killed. If a stranger starts game in one man's chase, and hunts it into another's liberty, the property belongs to the owner of the chase."

Anciently none was permitted to take or sell game unless duly qualified in respect of property, the qualification having been the ownership of lands of inheritance of the yearly value of £100; or for life, or for ninety-nine years or upwards of lands of the yearly value of £150. This qualification was imposed chiefly to preserve the different species of game, and was repealed by an Act of William IV., called the Game Act, which defines game as including hares, pheasants, partridges, grouse, heath or moor game, black game, and bustards. It was subsequently made necessary for sportsmen to take out a yearly game certificate attesting the payment by them of a certain amount of duty, and now the exclusive right to kill game upon any land is vested *ratione soli* in the owners of such land, who may, of course, let or grant the right to others. By 23 and 24 Vict., cap. 90, all persons killing game are required to take out a yearly excise licence, in substitution of the old game certificate, and persons who deal in game are required to take out an excise licence for the purpose. By a later Act an excise licence of 10s. has been imposed upon every person, with some exceptions, using or carrying a gun.

There are many penal provisions (too numerous to mention here), intended for the better preservation of game, and for the protection of landowners against poaching, and generally against unlawful trespasses in pursuit of game. The Game Acts are also directed to deer, woodcock, snipe, quails, landrails, and rabbits. Of course, an agreement between a landlord and his tenant generally contains a clause reserving the game to the former; apart from this, the right to the whole of the game would belong to the tenant.

As regards hares and rabbits, by two Acts of Parliament (11 and 12 Vict., cap. 29, and 23 and 24 Vict., cap. 90) it is provided that, in the absence of agreement to the contrary, any occupier of enclosed lands (or any owner with the right of killing game there) may kill hares on such land without an excise licence; and anyone may pursue hares with greyhounds, beagles, or other hounds without an excise licence, subject, of course, to any question of trespass. No licence need be obtained by one who is merely assisting another in pursuit of game which his employer is licensed to kill.

The Ground Game Act, 1880, was passed "in the interests of good husbandry, and for the better security of capital and labour invested by occupiers of land in the cultivation of the soil." By this Act it is provided that the right of the occupier to kill hares and rabbits (*i.e.*, ground game), concurrently with the landlord or other person entitled under him to such game, is made a right inseparable from his occupation. The occupier cannot contract himself out of this concurrent right, and need not procure a licence to kill such game, and may let the right to any third party. The method of exercising such right is, however, subject to certain limitations. Traps must not be set except in rabbit burrows, nor may poison be used. Firearms may not be used at night (between one hour after sunset and one hour before sunrise), nor may they be used at any time except (1) by the occupier himself, and (2) with his authority by some one other person. The occupier may authorise the taking of hares and rabbits by other means by members of his own household resident on the land, persons in his ordinary service on the land, and persons *bonâ fide* employed for reward in taking and destroying ground game. The authority must be in writing, and must be produced on demand to persons who have a concurrent right to the game, or to an authorised agent.

In conclusion, we may observe that, owing to the almost indiscriminate slaughter of hares, a close season has been provided (by an Act of 1892), extending from March to July, both inclusive, during which period hares may be killed but not sold; and that a measure of protection has been afforded to tenants by a judgment of the High Court, to the effect that persons who overstock with game lands over which they have sporting rights are liable for damage thereby caused to the crops of the occupiers.

ON THE GREEN.

TAYLOR is the man whom the critics pick out, with a unanimity that is rare, as most likely to win the open championship. This is the opinion of St. Andrews critics themselves. Andrew Kirkaldy told me he thought Taylor would win, giving as his reason that Taylor's two shots, especially two long shots, are better than the two shots of any other man. It is only another way, but rather a striking and forcible one, of saying that Taylor is a better player than any other man; for these two shots, especially the second of them, are the shots that count and make the difference. A few years ago one would have said that Harry Vardon had this advantage—a small one, but appreciable—over the rest of the best; but he is not quite the man he was, and Taylor, in the meantime, seems to have put some yards on to his driving, which makes him still more terrible than he used to be. He has won before at St. Andrews, so will start with a good confidence, which goes for much. His work at Northwood and West Drayton also ought to give confidence both to himself and his backers. It is true that at Northwood Toogood beat him by a putt, but at West Drayton he beat everyone, including the previous record. Toogood, perhaps it should be said, was not there; but there were Vardon, Braid, and White, a goodly company enough. St. Andrews, stretched out as it is to make up for the wearing away of the whins, and the introduction of rubber-cored balls, still tests the two shots more shrewdly than any other green. The result will be interesting to see. Taylor's two rounds of 73 each at the Lytham and St. Anne's competition were wonderful, both being only a stroke above the highly-tested record for the green, which is held equally by Mr. Ball, Mr. Hilton, and Harry Vardon. His total was no less than seven strokes better than Braid's, who was second, and Braid was three strokes in front of Tom Vardon, who was third. Harry Vardon was fourth, at two strokes behind his brother, and these four qualified for the subsequent tournament play. How curious a game golf is was strikingly shown by that subsequent play, in which Tom Vardon comfortably beat Taylor and Braid beat Harry Vardon. Tom Vardon is never one to be dismayed by the weight of the artillery brought against him. Nevertheless he was roundly defeated by Braid in the final heat. It was a well-deserved win, for Braid has been a little unlucky lately. He will play all the better for the encouragement it will give him. Had it not been for one disastrous hole one of his rounds would have beaten both Taylor's score and all previous records. He would seem to be just coming to the top of his game, and to be coming to it just at the right time. Seeing that we are talking of long drivers, it may be noticed that Mr. Edward Blackwell is in good form. He did not play well for the St. Andrews medal, but was playing a good game during the week, and later has been winning the Midland Counties' competition, with scores of 79 and 76, at Handsworth. These returns put him four strokes ahead of Mr. Ashton, who was second. Mr. Osmund Scott was third, at a stroke more than Mr. Ashton, and Mr. Denys Scott fourth, at a stroke more than his brother. So Mr. Blackwell's win was against a field that there was honour in beating. Another incident of the same meeting was a team match between amateurs and professionals, both of the Midlands. Mr. Blackwell was the leader of the former and Tom Williamson of the latter. The professionals won, but the amateurs made a very good fight, and are, I think, to be congratulated on the goodness of it, for there are some very useful professional players in our Midland Counties.

And now every amateur who aspires to be a champion is on the move towards Prestwick. The last time that the amateur championship was held there the occasion was historical. The final was between Mr. Ball and the late Mr. F. G. Tait, and Mr. Ball won, after the thirty-six holes had ended in a tie, by holing the thirty-seventh hole, that is to say, the first of the Prestwick course, in three, which is just a stroke too good, for it is a four hole. He had started the second round with a disadvantage of four holes, lost on the first eighteen, so his win was a very fine one. Regret is a vain emotion, but one cannot think of that gallant fight without the keenest sorrow for the loss which makes it impossible for us to see these two, so well matched, playing against each other again. HORACE HUTCHINSON.

THE AUTOMOBILE WORLD.

THE more important provisions of the Motor-car Act are fairly well known to the majority of motorists, but it would appear from some of the questions recently asked in the House of Commons, and from letters which have been published in the newspapers, that a surprising degree of ignorance exists on the subject among the general public. It is difficult to believe that anyone who is fully acquainted with the law could call for any further increase in the severity of the restrictions with which the motorist is encompassed on every side. To begin with, no one may drive an automobile a yard in this country without providing himself with a licence from the authorities. It is true that a licence will be granted to any person above the age of seventeen years, without any enquiry into his proficiency, but those who declare this to be a defect in the law are apt to overlook the real purpose of the licensing system. In the first place, it provides a means of identifying the driver of a car as distinct from the owner, who alone is indicated by the number. The licence must be carried on the car, and failure to produce it, when demanded by a constable, is in itself an offence. Moreover, every conviction, however trivial or technical the breach of the law, is endorsed on the licence, so that a driver is always accompanied by a full record of his motoring indiscretions. Once convicted, even if it be merely for failing to observe that a lamp has blown out, or for allowing the engine to run when the car is stopped, the endorsement follows as a matter of course, and can never be erased. Of far more importance, however, from the public point of view, is the power of the magistrates to suspend a licence for an indefinite period. For reckless driving, or even for exceeding the legal limit, an offence which may be committed unintentionally by the most law-abiding and considerate of drivers, a man may be deprived of his livelihood or prevented from enjoying his favourite pastime. This provision of the Act is thus in itself amply sufficient to rid the roads of the motor hooligan, and within the last few weeks several drivers of this class have been rendered incapable of further mischief for a period of several years. The test of proficiency, for which so many people clamour, would prove a purely illusory safeguard, as it is not want of skill, but absence of care and consideration for others, that leads to accidents and brings motoring into disrepute.

THE SCOTTISH TRIALS.
Cars waiting at the foot of the Cairnwell Pass.

In other respects the Act is equally severe. It is popularly supposed that so long as the motorist does not exceed a speed of twenty miles an hour he is beyond the reach of the law. Nothing is farther from the truth. He may drive his car at a maximum, not an average, speed of twenty miles, only when the road and the state of traffic on it are suitable for such a speed and no person is endangered thereby. Such, in effect, is the substance of the first section of the Act, and a bench of magistrates can rule, in any particular instance, that even five miles an hour is too high a rate of speed. The punishment for a breach of this section can hardly be said to err on the side of leniency. A fine of £20 may be inflicted for a first offence, while any subsequent offence, however wide the interval of time between the two convictions, may result in a fine of £50 or a term of imprisonment not exceeding three months, besides the suspension of the driving licence.

We have summarised above only a few of the more important regulations by which the motorist is governed, but they suffice to show that the existing law, if properly administered, is fully capable of eliminating the reckless driver from the ranks of automobilists. There is little fear of the local magistrates and police failing in their duty to the public in this respect. On the contrary, there is a strong probability of the motor driver being treated with undue severity. After a period of sensible

A HILL-CLIMB CONTROL IN THE SCOTTISH TRIALS.

and impartial administration of the Act there has been a regrettable recrudescence in many districts of that spirit of unfairness and intolerance which, in the past, has brought discredit on Courts of Petty Sessions. Once again one hears of the refusal to listen to evidence which any other tribunal in the country would treat with respect, and of motorists, innocent and guilty alike, convicted and heavily fined on the flimsiest excuses.

HINTS FOR BEGINNERS.—II.

CONTINUING the important subject of lubrication, it must not be supposed that the motor and gear-box are the only portions of the mechanism that require constant attention. The wheels demand particular care, and where screw-down grease cups are not fitted to the hubs, the wheel caps should be removed periodically and the oil replenished. It is usual to place, in addition, a certain amount of grease in the recessed portion of the cap, so that, in the event of the axle heating, the grease would melt and run into the bearing. Every precaution should be taken to prevent grit finding an entrance into the hubs when the wheel caps are removed, as it will quickly play havoc with the wearing surfaces. In the case of most gear-driven cars, the rear axles are automatically lubricated, and, therefore, hardly require such constant attention, but a careful driver will always place his hand on all the hubs in turn, at the end of a run, in order to feel whether there is any indication of heating.

Another portion of the mechanism that requires careful treatment is the steering gear. All the exposed joints, especially those at the extremities of the distance rod in front of the car, should be well smeared with grease and encased in leather. With this precaution they may be left for six months or more without further attention. All grease cups should be kept well filled, and the screw cap given an occasional turn, which should vary in frequency as common-sense dictates. Oil-holes will also be found scattered about the car, none of which should be neglected. It must not be supposed, however, that the time required for these operations is a long one. The preliminaries to an ordinary run need not take more than a few minutes, and in the case of a modern car, in which all the important wearing surfaces are automatically lubricated, the oil-can is only required occasionally.

There are certain legal preliminaries to be observed before a new car may be driven on the public roads. Application must be made to a county or borough council to register the vehicle and allot it a number. The fee is £1 in the case of a car, and 5s. for a motor-cycle. The applicant will be required to fill in a form asking for certain particulars, such as the make, horse-power, and description of the car, and the position in which it is proposed to place the number plates. It is not necessary to apply to the council of the county or borough in which one resides, though it is usual to do so, as the registration fees go in relief of the rates. If the car or cycle changes hands the number will be transferred to the new owner on payment of 5s. in the case of a car and 1s. for a motor-cycle. Any change of ownership must be notified to the registering council either by the new or the old owner. If desired the registration will be cancelled, and, as a matter of grace, the old number will sometimes be reallotted to a new car acquired by the same owner. In addition to the registration fee, which is only paid once, there is the carriage tax, which, for a car not exceeding one ton in weight, is £2 per annum.

Every person who drives an automobile must obtain a licence from the county or borough council in which he resides. This costs 5s., and must be renewed every twelve months on the date when it was first granted. Application may be made for its renewal before the date of expiry, so as to avoid delay. Any police-constable may demand to see a driver's licence, and as any failure to produce it inevitably results in a summons and conviction, with the consequent endorsement of the licence, an invariable rule should be made of carrying it on the car. No difficulty arises where only one car is kept, but it is an undoubted hardship under the present Act that a driver should be liable to police-court proceedings for a perfectly harmless act of forgetfulness. Many a motorist has been fined for leaving his licence at home or in the pocket of another car.

THE SCOTTISH RELIABILITY TRIAL.

NOTHING so severe in the way of automobile competitions has been held in Great Britain as the Scottish Reliability Trial, which was concluded on Saturday evening. The Scottish Automobile Club have always favoured drastic endurance tests, and their annual Glasgow to London non-stop run has been regarded as a more or less formidable undertaking; but this year the executive desired something that would even more strikingly display the capabilities of the up-to-date car. Accordingly they elected to have a four days' trial, resembling in its control methods the English Reliability Trials that have been held from time to time, but over routes not only averaging a much greater daily distance, but offering distinct obstacles in the way of rough roads and steep and winding hills. The competition was confined to touring cars, with engines not to exceed a stated capacity by formula, in which the cylinder diameter in inches squared, and multiplied by the number of cylinders, was divided by three. This practically limited the cars to those with cylinders not exceeding 5in. bores. As nothing was said in the formula, however, as to length of piston stroke, it would have been possible to introduce a car of higher power than was desired provided someone made an engine with more than average disparity between the bore and stroke. As regards the general conditions of the trial, it may be said that it practically formed a non-stop run, the only stops not causing loss of marks being compulsory, except for tyre troubles, and during these no repairs or adjustments to the car were permitted, save an allowance of 5min. for brake adjustments on the second, third, and fourth days.

The first day's run was one of 136 3-8 miles, from Glasgow to Edinburgh, Stirling, Perth, and Dundee. As on the subsequent days, a minimum time was allowed for each stage of the journey, to ensure the avoidance of excessive speed, under pain of disqualification; on the other hand, there was also a maximum allowance, in order to ensure a reasonable degree of efficiency. The day was almost entirely without incident, tyre troubles, curiously enough, being the

The Motor News says:—

"Nipped tubes are a constant source of trouble, especially to a beginner. The Sirdar air tube gets over this difficulty. It is vulcanised in a **U**-shape, so that when placed inside the cover it springs naturally into the crown of same, and so keeps clear of the edges of the cover, or the tools used for fitting purposes. It is essential, however, that it should not be partially inflated when the cover is being replaced. These tubes are made, if anything, larger than the inside of the cover, and when inflated are compressed both laterally and longitudinally, instead of being stretched as the ordinary air tube is. They consequently afford great resistance to puncturing material."

The Times says:—"Testimonials received by the Sirdar Rubber Company from the Straker Steam Vehicle Company after the 2,000 miles' trial of their petrol omnibus are of a very satisfactory character, and they have many others."

in 3 miles 484yds., an average of 1 in 17 throughout; and it must be borne in mind, of course, that the cars had not only to take this ascent in the course of a day's journey of 166 1-8 miles, but after three previous days of difficult running among mountain scenery, and without any opportunity of attention to adjustments, save under the penalty of loss of marks. Only two cars, however, failed to complete the journey, namely, the 20 h.p. Ford and the 15 h.p. Darracq. As in the case of the Cairnwell ascent, the cars were timed up Loch-Na Craig. The Scottish Automobile Club have decided not to publish the times recorded on each hill separately, but only the mean of the performances combined. In Class A the 6 h.p. Wolseley was easily first with 17min. 33 4-5sec., and in Class B the 12 h.p. Wolseley was also well ahead of the other competitors with 16min. 33 4-5sec. The performances

8—10 *H.P. FOUR-CYLINDER HUMBER.*

in Class C, however, were much closer, and it would be invidious not to mention at least the following: 24 h.p. Thornycroft, 12min. 27 3-5sec.; 24—32 h.p. Mors, 13min. 9 1-5sec.; 24 h.p. Germain, 13min. 34 2-5sec.; 20—25 h.p. Ariel, 13min. 51 4-5sec.; 20 h.p. Vinot-Deguingand, 14min. 29sec.; 30—40 h.p. Belsize, 14min. 35 3-5sec.; 18 h.p. Siddeley, 14min. 38 2-5sec.; 8—10 h.p. Humber, 15min. 29sec.; 16—20 h.p. Beeston-Humber, 15min. 34 2-5sec.; 14 h.p. Minerva, 16min. 7 1-5sec.; 18 h.p. Chenard and Walcker, 16min. 7 4-5sec.; 12—14 h.p. Gladiator, 16min. 41 4-5sec.; and 16—20 h.p. Argyll, 16min. 46 3-5sec.

As regards non-stop performances throughout the entire trials, it may be mentioned that the number was naturally small if tyre troubles be included. Excluding these, however, and taking into consideration stoppages from mechanical causes only, non-stop runs were scored on each of the four days by the following cars: 8 h.p. De Dion, 9 h.p. Cadillac, 6 h.p. Light Wolseley, 16 h.p. Albion, 16 h.p. Beeston-Humber, 20 h.p. Ariel, 24 h.p. Mors, 24 h.p. Germain, 24 h.p. Thornycroft, 12 h.p. Richard-Brasier, 30—40 h.p. Belsize, 15 h.p. Brooke, 20 h.p. Vinot-Deguingand, 12 h.p. Gladiator, and 12 h.p. Argyll. On three out of the four days the following had clean sheets: 12 h.p. Pipe, 8 h.p. Darracq, 12 h.p. Gladiator, 8 h.p. Humber, 18 h.p. Chenard and Walcker, 14 h.p. Minerva, and 16 h.p. Argyll.

A Club for Marine Motorists.

THE Marine Motor Club of Great Britain and Ireland, whose formation we foreshadowed last week, is an accomplished fact. On Monday last, a well-attended meeting was held at the Automobile Club, at which the new body was inaugurated, the rules passed, and a committee appointed. Dr. Boverton Redwood was elected vice-commodore, and Lieutenant Mansfield Cumming, R.N., rear-commodore. On a ballot, the following members were appointed to the committee: Major Lindsay Lloyd, Captain Dixon, and Messrs. Gorham, R. G. Rouse, Linton Hope, Boverton Redwood, Bircham, Tower, L. de Rothschild, H. E. Clarke, and G. F. Sharp. Further appointments will be made at the next meeting of the club on June 19th. It is proposed to have a floating club-house stationed near Southampton, where sleeping, dressing, and locker accommodation will be provided, and meals can be obtained. Arrangements will also be made for the storage and sale of petrol, and members will have the use of a workshop. The nucleus of an important and useful programme for the forthcoming season already exists in the Reliability Trials and the Selection Race for the British International Cup, which will be held in the Solent in the first week in August. The preliminary work in connection with these events has, of course, been carried out by the Automobile Club, which has now handed over its interests in motor-boating to the new organisation. The parent body has generously undertaken to provide a sum of £600 for the first year and £300 for the next two years towards the establishment of the club-house and other necessary expenses, so that the financial position of the Marine Motor Club is fully assured from the commencement. The subscription is £3 3s. per annum, except in the case of members of the Automobile Club, who will pay a reduced subscription of £2 2s. The first 250 members will be founder members, and will pay no entrance fee. Full particulars can be obtained on application to the hon. secretary of the club, 119, Piccadilly.

An Inexpensive Four-cylinder Car.

A year ago the four-cylinder motor was a luxury for which the motorist had to pay a high price. In cars costing from £200 downwards the single-cylinder engine was the rule, and below £500 the purchaser's choice was almost entirely confined to vehicles with two or three cylinders at the most. Acting, perhaps, on a hint from one or two foreign firms who had brough

out some surprisingly cheap machines, several British makers set themselves the task of producing light four-cylinder cars, at a price little higher than the standard 6 h.p. or 8 h.p. single-cylinder vehicles, to which the motorist of limited means had hitherto been restricted. Prominent amongst these enterprising manufacturers were Messrs. Humber, who startled the automobile world by staging an 8—10 h.p. four-cylinder light car at the Stanley Exhibition last autumn, which they priced at the very low figure of 215 guineas, with two-seated body. It was a neat and attractive-looking little machine, and excited favourable comment. It is true that the prices were subsequently increased to a slight extent, but the 8—10 h.p. Coventry Humber still remains, we believe, the cheapest four-cylinder car on the market.

Its designs follow conventional lines, which in itself is a point in its favour, as experimental variations from accepted practice are undesirable from the purchaser's point of view. The four cylinders, which are cast separately, have a bore of 3 1-8in. and a stroke of $3\frac{3}{4}$in. The inlet valves are mechanically operated, and the ignition is on the high-tension, coil and accumulator system. The motor is a neat, compact piece of work, and the question of accessibility has been carefully studied. A leather-covered cone clutch transmits the power to the gear-box, which gives three speeds forward and a reverse, the drive on the top speed being direct to the rear live axle. The brakes are of ample proportions and power, and the steering gear is carefully designed with a view to taking up any wear which may occur.

We recently had an opportunity of taking a short run on one of these cars, and were much impressed with the power and "life" of its engine. Although fitted with a very comfortable four-seated body, the car showed a remarkable turn of speed and a degree of flexibility in traffic which was an eloquent testimony to the excellence of the motor. The ascent of Netherhall Gardens was accomplished without a falter, and only on the steepest portion was the lowest gear required. Generally speaking the 8—10 h.p. Humber appeared to us to be a smooth-running, flexible, and powerful little machine, which should undoubtedly be examined and tried by anyone in search of a light four-cylinder car at a moderate price.

MIDLAND AUTOMOBILE CLUB'S CONSUMPTION TRIAL.

On Saturday the Midland Automobile Club conducted a Consumption Trial on the lines foreshadowed in our issue of last week. The distance to be covered measured 93 miles, over an irregular course starting from Wishaw Hall Farm. At the close of the trial it was found that the first prize, a gold medal, fell to Mr. C. W. Dixon; the second prize, a silver medal, to Mr. R. R. Brown; and the third prize, a bronze medal, to Mr. Cecil Edge. The following table shows the principal results:

	Weight. *cwt.*	*lb.*	*Spirit used (gallons).*	*Points gained.*
C. W Dixon, 12 h.p. Lanchester	28	7	2·50	7·85
R. R. Brown, 16 h.p. Wolseley	25	63	2·61	6·84
C. Edge, 15 h.p. Napier	29	7	3·04	6·69
A. E. Crowdy, 12 h.p. Wolseley	28	35	3·27	6·06
G. H. Lanchester, 12 h.p. Lanchester ...	31	49	3·87	5·68
C. V. Pugh, 12 h.p. Lanchester	29	92	3·75	5·55
A. Luff-Smith, 14 h.p. Wolseley	26	70	3·64	5·11

THE CROSS-MEDITERRANEAN FIASCO.

The Algiers-Toulon motor-boat race, in spite of all the promised precautions, has ended in a catastrophe. As we recorded last week, the seven boats which started from Toulon arrived at Port Mahon, about half-way across, and thus successfully completed the first portion of the journey. Then for five days, the weather conditions being unfavourable, the boats were detained at Port Mahon until, on Saturday morning, the officials gave way to the importunities of the competitors, and allowed them to resume the race at 4 a.m. A light breeze was blowing, but the barometer was very unsteady, and those who had had experience of these waters were very dubious about the wisdom of the proceeding. Within six hours a violent gale had arisen, and the sea was running exceedingly high. Fiat X. quite early signalled to her accompanying torpedo-boat destroyer for help, and she and her crew were hoisted aboard. To this fact is due her salvation. One after another the competing boats were taken in tow, and in each case the crew had to be rescued, Mme. du Gast being nearly drowned as she was being removed from Camille, and the captain of the Malgre Tout getting his leg broken. In the end, Fiat X. was the sole survivor, and such fine boats as Mercédès-Mercédès, Mercédès C.P., Camille, Quand Même, Malgre Tout, and Heracles II. were sunk.

ITEMS.

We have received from Messrs. Joseph Lucas, Limited, of Birmingham a catalogue of their British-made "Motoralities" for 1905. Most of the accessories carried on every car are illustrated and described in this list, and the world-wide reputation of the firm is a guarantee of the excellence of their productions.

We reproduce on another page a photograph of a 14 b.h.p. single-deck Maudslay omnibus, taken while ascending Birdlip Hill. The car carried a full load of twelve passengers, and climbed the hill at an average speed of five miles per hour. The length of the climb is two miles, the average gradient being 1 in 7, while the steepest portion is said to be 1 in 5.

CRICKET NOTES.

WHEN one comes to sum up the form of the Australian team as compared with that of any eleven we can put in the field against them, there does not appear to be any clear indication of a marked superiority on either side. No one can deny that our visitors are exceptionally strong in batting, and although some experts consider that they are weak as regards their bowlers, they have certainly five or six men who can all bowl well. Mr. Cotter is somewhat of an unknown quantity, but he can send down a very fast ball, and although, as far as we have been able to judge at present, he is, to say the least of it, erratic in the length of his deliveries, on a bumping and fiery wicket he is sure to want a great deal of watching. In the match between the Australians against Surrey his analysis

as a bowler compares unfavourably with that of McLeod, Armstrong, or Laver. Whatever Mr. Cotter may be as a bowler, as a bat he is a mighty "slogger," and if ever he gets the chance of tackling some loose bowling the fun will probably be both fast and furious.

It would be a source of much regret if anything should militate against the popularity of the present tour arranged for our Australian visitors That they are most heartily welcome they know, or, at least, we hope they do, but the proposal which they have put forward curtailing the hours of play is meeting with much adverse criticism. On the face of it, one is inclined to think that a strong and healthy man should not find the strain upon his physical powers too great if asked to play cricket from 11.30 to 6.30, especially if one takes into consideration the fact that there is a luncheon interval of forty-five minutes, and an interruption of the game for tea, which accounts for another quarter of an hour. Moreover, one side does not, as a rule, spend the whole of the day in the field, and more often than not there are plenty of opportunities for rest in the pavilion. If the proposal of the Australian captain is to be enforced, play will commence at twelve o'clock and stumps will be drawn at six o'clock in all games other than the test matches. Under these rules three matches have already been drawn, and it appears to be inevitable that a similar result will obtain in many other matches during the season. It should also be remembered that there is a numerous class of cricket lovers who are unable, from a variety of circumstances, to devote more than a hour or two to their favourite amusement of watching first-class cricketers. To such as these the proposed alteration would come as a veritable hardship. It is much to be hoped that the Australian team will reconsider their decision, and that they will not ask for that which, simply as a matter of courtesy, is sure to be readily granted.

The chief item of interest in the competition between the counties has been the complete and decisive defeat of Middlesex by Gloucestershire. Even if the wicket was as bad as it was made out to be, all the more credit is due to Board for his brilliant century; then, too, Gloucestershire were certainly handicapped by the accidents which happened to their captain. On the other hand, it is urged that if Mr. Warner had not failed to score in either innings the result might have been different. That may be so, but the fact remains that he did not make any runs, and that a well-won victory remains to the credit of Gloucestershire. Bowley played a really fine innings for Worcestershire, thanks to which they made a capital stand against the powerful Yorkshire team; and Mr. C. B. Fry, who is playing in the most brilliant style, made another of his big scores for Sussex against Nottinghamshire. Mr. Fry appears to be able just now to make runs whenever they are most wanted, and it is much to be hoped that for once the Australians may get a taste of his quality.

RACING NOTES.

ANOTHER subject of exceeding interest to all those who are interested in any one of the many various branches of sport is the Street Betting Act. The different sections of this Act were published in these notes, and the insidious nature of the attack upon all forms of sport was pointed out at the same time. If the meaning of the provisions of this Act is clearly grasped by the public at large, there is not the slightest chance that this faddist attempt at class legislation will ever become law; but the fear is that, being looked

upon as a matter of no great importance, it may be allowed to slip through the House of Commons unopposed. Mr. Keswick, the member for the Epsom Division of Surrey, has given considerable attention to this Bill. I believe I am correct in saying that this gentleman is by no means inclined to look very favourably upon betting. His very able and clearly-expressed opinion with regard to the Street Betting Act is, therefore, the more to be appreciated, and his view of the subject seems to be so thoroughly fair and practical that there can be no hesitation in giving some extracts from a letter addressed by him to the hon. secretary of the Sporting League. He says: "I thank you for writing me so clearly on the subject of the Betting Bill, which may shortly be claiming the attention of the House of Commons. The evils that unfortunately accompany betting I do not believe that legislation will cure, any more than the measures for meeting other undoubted evils will cure them, and I am, therefore, not in favour of action founded merely on opposition to a deep-seated and sporting characteristic of our people. I consider it is desirable to prevent abuse of privilege rather than to legislate for the suppression of what is, more or less, a universal instinct, and I have no intention of being a party to passing what, if enacted, would be a law in restraint of the free exercise of their judgment by working men, any more than I would approve of depriving any other class of the community of the right of doing what they please, so long as no interference with the peaceful and lawful pursuits or amusements or practices of others is involved." It is certain that the views, with regard to the Betting Act, of the member for the Epsom Division of Surrey will receive the cordial approval of his own constituents, and of the vast majority of the electors of Great Britain.

During the past week the principal race-meetings have been those held

at Chester and at Kempton Park. The Chester Meeting, with its old associations, is one of those time-honoured gatherings which have managed to retain their hold upon the affections of racing folk, but in these days of mammoth stakes and race-meetings all over the country, it may not be an altogether wise policy to be content with living upon a past reputation, and one cannot help seeing unmistakable signs that a more liberal policy is much needed in the management of the race-meetings held on the famous old Roodee course. If ever there was such a thing as a certainty in racing, it was that St. Ives would win the first race on the opening day of the Chester Meeting, and the good thing duly came off, as Mr. Homan's chestnut filly made the whole of the running, and won the Mostyn Two Year Old Plate by a couple of lengths. In the Roodeye Maiden Plate backers were again on the right track, and Mr. S. H. Darling's Lady Yatesbury, shaking off the challenge of Tyntesfield, won cleverly by half a length. Desert Chief, the steeplechase horse, made a more than creditable show in the race, and coming into the straight was actually leading. He was beaten for speed in the run home, but managed to finish fourth. Just a dozen horses turned out for the Wynnstay Handicap Plate of 500 sovs. For some reason or other, that very bad horse, Rydal Head, was made favourite, but, as might have been expected, he had nothing whatever to do with the finish of the race, for which Powder Puff (8st. 9lb.), Sir Laddo (7st. 5lb.), and Longford Lad (8st. 8lb.) finished in the order named. The Cestrian Selling Welter Handicap was noticeable from the extraordinary feat accomplished by Chon Kina, who won the race for the third year in succession. Attalea was a very fortunate winner of the Stamford Two Year Old Plate, which, had it not been for what looked like a stumble coming round the bend, would certainly have been won by Lord Coventry's Coup de Grace.

Never, even in its most palmy days, has there been a more brilliant company assembled to witness the decision of the race for the Chester Cup than on Wednesday, the 10th. As to the race itself, all one can say is that both in numbers and in quality the field was anything but worthy of the occasion. Throwaway, the Ascot Cup winner of last year, was amongst the beaten lot, but he can hardly be classed among the best of the winners of that much-coveted trophy. Palmy Days is a beautiful mare, but she was palpably backward, and others of the competitors had been hurdle-racing during the winter months. In a prettily-run race, Throwaway made practically the whole of the running until fairly in the line for home, when Imari, served by his light weight and vigorously ridden by W. Saxby, forged his way to the front, and won by three-quarters of a length, relegating Mark Time and Throwaway to exactly the same positions which they filled in the race last year, when they finished respectively second and third behind Sandboy. Mark Time ran probably the best race of his life, and I

Modern House Decoration.

Hall's Sanitary Washable Distemper

Hall's Distemper is now the popular wall decoration in all good class houses. It is more artistic and cleaner than wall paper or paint, and saves 40 % of the cost of labour.

Hall's Distemper is applied with a whitewash brush and dries with a uniform surface, superior in appearance to flatted paint. It sets hard, is unaffected by heat or damp, does not crack or peel off, and is washable.

It contains no lead, and therefore does not turn black with age. Made in a wide range of 70 colours, which do not change or fade.

Free Sample with particulars from Sissons Brothers & Co., Ltd., Hull.

HARDY BROS., ALNWICK.

cannot help thinking that had a little more use been made of him he would have won outright; but George McCall is riding in exceptionally good form just now, and he knows the horse well, so that it may not improbably be that, try as he would, he could not give the 23lb. away to Imari. After the race for the Cup, the remainder of the racing was comparatively tame, and calls for little notice, except, perhaps, to remark that everyone was pleased to see the popular colours of the Duke of Westminster carried to the front in the Prince of Wales's Welter Handicap Plate by the aid of Eageress, by Eager out of Last of the Queens.

W. A. Rouch. *AMBITION.* Copyright

The only item of much interest on Thursday, the concluding day of the meeting, was the race for the Great Cheshire Handicap Stakes of 500 sovs., for which Catty Crag (9st. 5lb) was at once made favourite at 5 to 2, and his backers never had cause for uneasiness, for he came out with the race in hand five furlongs from home, and won in a canter by four lengths, a head dividing Palace Yard and Lady Yatesbury for second and third places.

A very fashionable, well dressed, and numerous assembly put in an appearance at the popular Kempton Park "Jubilee" Meeting to greet the arrival of His Majesty, who seemed to thoroughly enjoy himself, so much so that a well-known trainer was heard to exclaim: "Look at our King; God bless him! Wouldn't the Czar of Russia like to be able to do that!" Happy indeed is the monarch whose safest place is amongst his own subjects, and fortunate are the people who own him for their ruler. One of the prettiest finishes ever witnessed was that for the Stewards' Plate of 1,000 sovs., for which seventeen horses came under the starter's orders. When the barrier went up, Out o' Sight jumped off and made the running for about two furlongs, when Airlie took it up, in close company with Brother Bill, Aspendale, and St. Brendan, of whom the latter raced to the front about 300yds. from home, but was challenged by Thrush and Brother Bill, and a tremendous finish ensued; Mr. Daly's horse, however, fought out the battle unflinchingly, and, maintaining his advantage to the end, got home by a short head in front of Thrush, who finished just about the same distance in front of Brother Bill.

On Saturday the only race of any importance, with the exception of the Great Jubilee Handicap, was the Hampton Handicap of 500 sovs., but then the "Jubilee" is so popular an institution that were it the solitary item on the card the various enclosures would be well filled for the occasion. It is seldom, even for a big race, that so many horses are strongly fancied and heartily backed, and the result of the race was probably anything but favourable to the majority of backers. Fermoyle's splendidly-trained appearance in the paddock gained him a host of friends. Ypsilanti never looked better in his life. There is not much of Lancashire, but what there is is all quality. Union Jack stripped hard and full of muscle, Flower Seeker did not like the look of at all, Dean Swift looked commoner than ever, and L'Aiglon was not by any means as fit as his trainer would like to see him. The picture was a very pretty one when the fourteen horses came out for the parade, and then turned for the canter. There was little delay at the post, and a good start was effected. Some jostling took place at the bend for home,

in the course of which Ypsilanti was carried very wide. Two furlongs from home Housewife, who had made most of the running, had had enough of it, and Ambition took up the running. Inside the distance Fermoyle challenged, but failed to get up by a head; Union Jack was third, two lengths away. Not a little credit is due to W. G. Evans for his cool and resolute riding of the winner, and the lad should have a prosperous career in front of him.

ODDS AND ENDS.

LATELY the question of birds singing at night has been frequently brought up, and there can be little doubt but that in some places it is quite common for them to do so. In spring and summer in Canada, birds keep the woods awake most of the time, but then out there, with the long winter and short summer, the feathered songsters might be expected to make the most of their opportunities. Here at home, however, it is different, and it is rather strange to hear of blackbirds (in the County Down, Ireland), keeping up a regular chorus, a little after midnight, in the month of February. The night was calm and cloudy, and the gentleman who formed the audience to the concert says it sounded very weird. About a dozen blackbirds took part in the chorus. The cuckoo may often be heard at night in Ireland, but it is unusual to hear other birds. When electric light was first installed in the Dublin squares robins were frequently to be heard singing away by night to the unusual light, but they became accustomed to it and gave it up.

—o—

COLLECTORS of old garden ornaments and sundials will be interested in Messrs. Robinson and Fisher's sale at Willis's Rooms on June 1st. Included in this sale are an old and fine set of English wrought-iron park gates, an early Georgian portico from Fair Oak Park, Hants, and a well-head of the Foscarini family, date *circa* 1450.

—o—

MR. ALLAN JONES of the Hatherley Works, Gloucester, and 96, Leonard Street, E.C., is making a speciality of light and handy tables for use on verandahs, in the garden, or in houseboats, where space is limited. He calls our attention specially to those named respectively "Tsit al-tee" and "K" and "B" patterns, and to another specially designed for bridge.

—o—

WE have received a notice from the Great Northern Railway of the publication of their guide to hotels, furnished lodgings in farmhouses, and at the seaside in Norfolk, Lincolnshire, Yorkshire, and elsewhere. This should be most useful to intending visitors to these parts during the summer, and they will also have the advantage of travelling on a line that is well known for the completeness of its arrangements for the comfort of its passengers and the reasonableness of its return fares.

—o—

THE HUMBER COMPANY are publishing two testimonials which tend to substantiate their claim that "A light bicycle, if built by a maker of the highest standing, will last a lifetime!" One rider, weighing 15st., has ridden his Beeston Humber, of 25lb. weight, for five years, and says he has not even touched a nut on it since he had it. Another writes that he has ridden one of these machines 18,631 miles with only one minor repair. Those who buy from such a high-class firm escape the thousand annoying little mishaps that the cheap and nasty makes bring in their train.

The Princess of Wales has ordered it.** But it is not expensive by any means. **Can be obtained of all Tailors.** Send for Booklet:—APPERLY, CURTIS & Co., Ltd., Dudbridge Mills, Stroud, West of England.

MODES AND MOODS

I HAVE again been wandering in tailor-land this week, for I am never tired of admiring the wonderful smartness which can lie in simplicity when it is allied to impeccable cut and finish. I found all these qualities combined in the dress I have had sketched at Messrs. Nicoll's, and which appears on this page. It is the kind of frock one needs at all times of year, for it is equally serviceable for winter or summer, spring or autumn, country wear or travelling, or for early morning walks with one's dogs in the Park. The new-shaped "umbrella" skirt is made of narrow stitched panels widening out round the feet, and made still wider by the deep kiltings which are introduced into each seam, and make the skirt "flow" with excellent effect. The material is a plaid cut on the cross, which adds to the neat effectiveness of the costume. The little coatee is tight-fitting except just in front, where it meets and is held by two buttons and loops at the bust, down to which comes the roll collar of white cloth ending in points. The perfectly plain sleeves are full at the shoulder, and are devoid of all trimming, except a stitched cuff of white cloth. The hat is of a picturesque cavalier shape, trimmed with a long plume of cock's feathers. Worn over a workmanlike linen shirt, with a smart cravat of black satin, nothing could look better for morning wear when walking exercise is meant, and a dress of this kind is an absolute necessity in any well-ordered wardrobe.

That it is not always the strongest-looking things that are the most lasting is a fact which Messrs. Debenham and Freebody's present exhibition of antique lace amply proves. It is, indeed, miraculous how these exquisite cobwebs can have lasted through centuries, enduring use and abuse, wear and washing, and yet preserving their diaphanous beauty through everything. The collection in Wigmore Street should attract every lace-lover, for it is unusually comprehensive, and also the specimens are in beautiful condition and are priced remarkably cheap. A magnificent flounce of old Flemish lace of the eighteenth century, 10in. wide and nearly 3½yds. in length, is only 25 guineas; a superb Point de Venise collar, the most decorative and effective of all kinds of lace, is £40; and a most beautiful Genoese lace berthe of the eighteenth century, 9in. wide, is only 9 guineas. A very unusual flounce of old Italian pillow lace, of the "rococo" style, has the pattern, a quaint design of flowers in pots, rising from the edge to the border, instead of *vice versâ*, as is usual; this piece, 4yds. long and 9in. deep, is priced at 19 guineas. There are exquisite lappets in finest Point d'Alençon and Point de Flandres, as well as in old Brussels (a very different thing to the modern lace of the same name), so delicate and filmy that one wonders how the threads could ever have been woven so fine; and one recalls how these wonderfully fine threads were spun in cellars to keep their delicacy from contamination by the light. The delicate Point d'Alençon flowers were given their high relief on the cobwebby ground by the introduction of horse-hairs in the outlines; and as one examines the marvellous delicacy of these old laces one wonders how human fingers could ever have achieved anything so fine, and one thinks of the human eyes that must have been worn out over them! There is a great collection of old Greek laces, which would be most effective on linen dresses; and also a number of the Empire "hand-run" lace scarves which are now so fashionable and graceful for day or evening wear. A most beautiful set is the Point d'Angleterre

COAT AND SKIRT SKETCHED AT MESSRS. NICOLL'S.

flounce with tunic or train-piece, the latter being 40in. deep, and 2yds. 12in. in width, while the flounce is 7in. deep and 6yds. long. This set would be the loveliest of gifts to a bride, and has been reduced from its original price of 150 guineas to 100 guineas; and it would be a gift that would last not one but many lifetimes. The collection of black Chantilly shawls and squares is beautiful, and among them I found a shawl of black Honiton of the finest design, which was quite beautiful and most absurdly cheap, for if my memory does not bewray me, it was only 7 guineas. Modern laces of all kinds are to be found at Messrs. Debenham and Freebody's; but though very magnificent, they are not, in my opinion, comparable in beauty or effectiveness to the old specimens. The rooms adjoining the lace department are devoted to an exhibition of antique embroideries, and bric-à-brac, including old paste ornaments, Battersea enamels, old silver, and that quaint beadwork which reflects such credit on our great-grandmothers. The embroideries are most beautiful, and include a magnificent set of vestments of the early eighteenth century, from the cathedral of Imola, consisting of embroideries after a design of Raphael's, on cream silk; a beautiful valance of heavy silver embroidery on blue silk; a portière embroidered all over in silk, with a design of bunches of grapes, which is particularly beautiful; and a long panel of Early Italian work on cream silk, as well as numbers of other beautiful specimens of embroidery and old brocades and damasks, which I have not space to mention. The sampler pictures are very quaint; and what woman would not covet the set of forty paste buttons, twenty-four large and sixteen small ones, in their original case? Altogether Messrs. Debenham and Freebody's is a pit of temptation to all who love beautiful old things such as I have described; and the fact that the prices are uniformly moderate makes the temptation all the greater.

Now that the capriciousness of the fickle month of May is almost overpast, we can at last consign our fur garments to the camphor-chests, and bethink ourselves of the frills and furbelows fitted to the approaching dog-days. Feather boas have already taken the places of the fur "beasts" around our necks, and soon the feathers will themselves be displaced by the tulle ruffles, which are quite the most becoming setting to a feminine face that has ever been invented. The prettiest of these tulle ruffles are very wide and upstanding, very full, and very short, ending at either side in front with cascades of satin and velvet ribbon. Many of these ruffles are in pale colours—turquoise, mauve, green, or citron; and they look exceedingly smart if the colour is repeated in the hat of the wearer. Smartest of all, however, to my mind, are the ruffles in white tulle, piped with narrow white satin or speckled with black chenille, and the all-black ruffles with similar chenille spots. These go with all dresses, and always look well, and though all tulle ruffles are fragile, one may take comfort in the fact that they are not quite so fragile as they look, provided they are not worn on a damp day, which means absolute destruction to them. Another even more important item that should be prepared for the splendours of June is a sunshade, or, rather, many sunshades, for the plural is necessary if one wishes to present a well-turned-out appearance. A beautiful sunshade gives an appropriate finish to a beautiful dress, which is manifestly incomplete without it; and an exceptional opportunity to acquire every kind of sunshade is being offered by Messrs. Shoolbred in the Sunshade Exhibition which they open next Monday, May 29th. The windows of the great establishment in Tottenham Court Road will be given up to a remarkable display of every imaginable variation on the sunshade theme. There are sunshades for every kind of occasion, and especially beautiful are those in lace over coloured glacé silk, lined with chiffon, latticed through satin rings, and those in white "moiré impérial" decorated with motifs in guipure and embroidered bunches of Parma violets, which are also lined with mauve chiffon, latticed through satin rings, a most decorative and original form of lining. These are but two examples out of this extraordinarily extensive collection of sunshades; and as the summer, we are told, is going to repeat its record of sunshine of last year, it is as well to take advantage of the opportunities offered by Messrs. Shoolbred to acquire the sunshades which will be so much needed later on.

AT MESSRS. SHOOLBRED'S.

The "go-aheadness" of Messrs. Hampton and Sons is well known, and they have just given a new proof of it to their clients in the two illustrated booklets on "Furnishing Fabrics" and "Lace Curtains" which they have just brought out. The fabrics are all illustrated in colours by the "three-colour" process, hitherto reserved for art reproductions; and this new departure makes the booklet most charming to the eye, as well as giving an absolutely accurate idea of the colouring and design of the fabrics illustrated. The chintzes and cretonnes look particularly well in the reproductions, as does the charming "myrtle" printed linen, which Messrs. Hampton use with such success as casement curtains; and among other delightful reproductions in the booklets are the "Shelley" velvet curtains (which are remarkably cheap at 37s. 6d. per pair), and the embroidered taffetas "Chateau" curtains, which are one of their special novelties this season, and which have a distinctly original effect from the embroidery being across the top and down the side of the curtain, instead of at the bottom, where it is seldom seen. The lace curtains are immensely varied in design; and both booklets should certainly be applied for by all who are meditating renovating their household draperies.

A RICH DESIGN.

It is one of the truest signs of civilisation to show pride in one's house and home. The savages take but little care or thought of their habitations, so long as they have a pile of skins or branches to sleep upon, and the desire to decorate their homes is one of the surest proofs of their feeling the influence of civilisation. In our modern hurried existence it is given to few to build our own houses, but we can, all of us, decorate our homes and give them the note of personality which may be lacking to the exterior of the building, by choosing our furniture with discrimination and taste. Both these faculties can be admirably exercised at the sale Messrs. Story and Triggs are now holding at 152-156, Queen Victoria Street, E.C., of a manufacturer's stock of furniture, carpets, and curtains, which they are offering at most remarkable reductions of price. Notable items in this collection of goods are the "Grecian" and "Ambidexter" settees, well upholstered, and with ends that can be let down, thus converting the settee into a most comfortable couch; the great variety of overmantels, at about half their usual price; the solid oak bedroom suites, which are incomprehensibly cheap at £4 15s.; and the selection of carpets—Wilton, Axminster, Brussels, and Oriental—which offer an unusual opportunity for acquiring a valuable carpet at a low price. Those who would wish to know more about Messrs. Story and Triggs's sale should write for their illustrated catalogue, which will be sent on application.

For those who are still abroad or detained in the country, yet who want to put their dresses for June in hand at once, I would advise a postcard being sent to Mr. Ernest, 185 to 189, Regent Street, with a request for his new summer booklet, illustrated in colours. It is most charmingly got up, and the many designs included in its pages give an admirable idea of the beauty and elegance for which Mr. Ernest's dresses are particularly famous. Coats and opera cloaks are also illustrated therein, and the booklet will be found not only charming to the eye, but most stimulating to the imagination of any woman who is renovating her wardrobe.

Now that the summer, it may be hoped, is coming on, it is not inappropriate to call attention to Pearson's most excellent series of antiseptic articles; for hot weather is apt to make such things necessities in a household. Pearson's Antiseptic is world-renowned as a non-poisonous disinfectant, and it is a germicide as well, for it quickly destroys microbes in air, soil, or water. Its non-poisonous character makes it particularly applicable for household use, obviating the accidents which so often occur with carbolic acid. It is the traveller's best friend for protection against the undesirable attentions of insects, mosquitos, and poisonous flies; and in all kinds of epidemics it is invaluable, for experts have declared that "the potency of this disinfectant is beyond all doubt." For bites and stings of horse-flies, wasps, bees, and reptiles the immediate use of one drop of Pearson's Antiseptic, rubbed pure into the wound, will at once destroy the poison. It is a delightful invigorator in the bath, for which one teaspoonful is sufficient; and it is also excellent as a dentifrice

Diet v. Cosmetics.

A Good Food Clears the Complexion.

The best "Beauty Doctor" in the world is a good, pure food. Rich, greasy, or poorly cooked foods will ruin the finest complexion a woman was ever blessed with, and all the cosmetics and treatments she may give it will only cover up, not remove the blemishes.

The treatment must come from the inside, for the pores of the skin must have the proper food to be healthy.

A lady living in the West of London writes as follows :—

"Grape Nuts Food has done me a world of good. Some years ago I fell a victim to a serious illness, which did great damage to my constitution. I gave up hope of ever recovering my natural good health until last winter, when tempted to try Grape-Nuts more from a liking for that kind of food than from any hope of it doing me good.

"I found to my surprise after a week or two's trial that I was getting quite plump, my voice and chest much stronger, and my complexion beautifully clear. In fact, since taking the Grape-Nuts my friends say I look ten years younger, and I believe them, as my glass tells me it is true."

Name given by the Grape-Nuts Co., Ltd., 66 Shoe Lane, London, E.C.

for preserving the teeth and purifying the breath. When a disinfectant is required to penetrate the skin it can be had in the form of Pearson's Antiseptic Liniment, for it is readily absorbed, thus introducing an effective subcutaneous antiseptic action immediately. These invaluable articles are sold in all parts of the world, or can be had direct from Pearson's Antiseptic Company, Limited, 254A, High Holborn, W.C. LAMIA.

LITERARY NOTES.

IN the series of little masterpieces published by Mr. Heinemann, three new volumes have just appeared, viz., *The School for Scandal*, *The Critic*, and *The Rivals*, all by Sheridan. Each is supplied with a preface by Mr. Edmund Gosse, of which the most interesting is that to *The Rivals*. Mr. Gosse shows that without being directly autobiographical this play is coloured from prologue to epilogue by Sheridan's personal history. He says:

"He had lately been a part of the sham chivalry and the sham romance of which he made such immortal fun, and the impressions of the absurdities of life were fresh upon his memory when he wrote *The Rivals*. He had been twenty years of age when he eloped with Elizabeth Linley, exactly as Lydia Languish hoped to fly with her Beverley. He had been twenty-one when he fought two ridiculous duels, which were evidently in his mind when he invented the inimitable scenes in the fifth act of the play. He had suffered 'inexpressible torments,' and had indulged in 'sheets of unintelligible rhapsody.' At the house of Mrs. Miller, in Bath, he had met with pretension and incongruity and fashionable flutter enough to rig out a dozen Mrs. Malaprops. He had poured verses into the celebrated vase, dressed with pink ribbons and myrtles, which crowned the fair of Parnassus at Bath Easton. Throughout his tumultuous, absurd, romantic youth, Sheridan had seemed to be rather acting than observing, but his keen eyes were open to the world of folly, and he was still but twenty-three when he sat down to write this immortal picture of it all."

It is good news that the firm of Macmillan is reprinting the works of Sir Walter Scott, Thackeray, and Charles Dickens in their 2s. series. These books are beautifully printed and very elegant in appearance, though we are not sure that we altogether approve of everything in the Waverley Novels. For example, Mr. Andrew Lang's Waverley is a very beautiful and accomplished bit of writing that we would not lose for a great deal, but the notes interspersed throughout the text appear to us out of place. For instance, after Chapter V. there follows this note: "These Introductory Chapters have been a good deal censured as tedious and unnecessary. Yet there are circumstances recorded in them which the author has not been able to persuade himself to retract or cancel," and after Chapter VIII. we are told that "There is no particular mansion described under the name of Tully-Veolan; but the peculiarities of the description occur in various old Scottish seats. The house of Warrender, upon Burntsfield Links, and that of Old Ravelston, belonging, the former to Sir George Warrender, the latter to Sir Alexander Keith, have both contributed several hints to the description in the text. The house of Dean, near Edinburgh, has also some points of resemblance with Tully-Veolan." It is a pity to put this information in the text, just because it destroys the illusion of those who read Sir Walter for the first time. Why could they not have been relegated to the end of the book, like the other notes of author and editor? None of them is really necessary to the enjoyment of Scott; yet they are pleasant and readable, because Mr. Andrew Lang, like Sir Walter, is an extremely well-read man, and here produces some of the most interesting notes he has picked up in the course of his journeyings.

The Golfers' Year-Book (Nisbet) has an interest to all those who wield the mashie and the cleek. It is edited by that excellent golfer John L. Low, and contains the Rules of Golf—concerning which there is always so much dispute on every course—the Golfer's Calendar and Directory of Golf Clubs, not only in Great Britain and Ireland, but on the Continent and in the United States as well. On the various events and topics which have interested players during the last twelve months, articles are written by such well-known authorities as Harold H. Hilton, Jack White, Horace G. Hutchinson, Miss Mary Hezlet, and J. H. Taylor; while bringing up the rear of these contributions is one that is, perhaps, more valuable than the others, viz., "How to Keep a Golf Course in Good Order," by Peter W. Lees, green-keeper to the Mid-Surrey Golf Club. Many of our readers will remember the excellent articles from his pen which appeared in our own pages.

Mr. Percy Bate is to be congratulated on an excellent subject in *English Table Glass* (Newnes). The drinking glass is the very instrument of good fellowship, and he who possesses one that has survived the festive perils of some half-dozen generations of ancestors, is the guardian of a shrine of memories which he will do well to cherish. It deserves well of us, and the honour of a record of its life. In many cases it offers some small fragments of history whereon the loving student may work, and so help to the writing of the whole story. No one would desire that we should, for instance, be without the fine series of Jacobite glasses, and especially the splendid specimen (No. 200) bearing the cypher of the Old Pretender, and two verses in the familiar strain and spirit of our present National Anthem, exquisitely cut with a diamond on a perfectly-shaped wine-glass, or that of the "sober" club of Glasgow, at which nothing but water was drunk. The collector will find this handbook to be a very practical and convenient guide, not only to this, but to all other branches of the subject. Further research may enable Mr. Bate to add, in a later edition, to his somewhat meagre account of sixteenth and seventeenth century glass; for one thing, the noble standing covered cups now exhibited in the Victoria and Albert Museum might have been referred to. But the eighteenth century, to which belongs nearly all the best glass extant, made for table use, is quite adequately dealt with. The author gives a classification of glasses, based on the shapes of stem and bowl, which appears quite sound, and should be of great use; and the same may be said of his practical and successful method of photographing his specimens. The chapter on frauds and forgeries is a suggestive warning against the wiles of the dealer, whose shop-windows nowadays are far too frequently filled with Dutch imitations. The text is pleasantly written and without pedantry, and the 250 odd illustrations are well-chosen, representative, and effectively reproduced.

Plague is a formidable subject to write a book upon, but the feat has been achieved by Professor W. J. Simpson, in his *Treatise on Plague* (Cambridge University Press), dealing with the historical, epidemiological, clinical, therapeutic, and preventive aspects of the disease. He deals with his subject in English, as opposed to the Oriental method—that is to say, he examines it coolly, scientifically, dispassionately, with the object of finding out how it can be prevented or cured. This may seem to be the simplest possible course, but, as he reminds us in his preface, there is much apathy to be overcome among those who consider that plague is Nature's scourge and necessary to prevent the over-population of the world. They are not far removed from the fatalists of the East. Happily, it has never been the way of Englishmen to bow their head to misfortune in this fashion; and Professor Simpson has here written a book that is likely to become a classical authority.

In a small volume called *Insect Life* (Methuen), Mr. F. V. Theobald gives an account of the life history, structure, and classification of insects. The condensed nature of the work enables the reader to grasp the more important characteristics of insects and insect life, without having to read any unnecessary general matter. The book is divided into four sections, each section being independent of the others. The first two deal with the metamorphosis and structure of insects, the third section treats with the eight orders of the class insecta, a separate chapter being devoted to each order. The last section, which consists of one chapter, includes an account of the various insecticides and their uses. The chapter on the metamorphosis of insects opens with a description of the embryonic development, showing what changes occur inside the egg. After this follows an account of the post-embryonic development, which includes those changes undergone by an insect after its emergence from the egg, that is, its metamorphosis. The chief points emphasised in this chapter are the process of moulting, the quiescent and active pupæ, and the difference between complete and incomplete metamorphosis. The internal changes that go on during the life of the larva and pupa are compared, and the manner in which most of the larval organs are broken up on passing into the pupal stage, and new organs formed, is described in detail, the description being accompanied by illustrations of these changes. The chapter on the structure of insects first deals with the external structure and then with the internal anatomy, both parts of the chapter being profusely illustrated by descriptive diagrams. In the chapters on the orders, each chapter commences with an account of the general characters of the order with which it deals. This account is followed by a system of classification, which classification is then enlarged upon by the description of various types, treating of their economic importance at the same time. Numerous woodcuts are inserted in the text, which will assist such readers as are not acquainted with the types in nature. Most of the insects described are injurious ones, and there is suggested in nearly every case a method of keeping their numbers down when the natural agencies are not sufficient for the purpose. In the last chapter the author gives a list of the various poisons which are used to kill these insect pests, and pictures the machines by means of which these poisons are scattered. Both entomologists and agriculturists will find this volume of interest, from its practical as well as from its scientific point of view.

SHOOTING NOTES.

THE GROUSE HATCH.

PROPRIETORS of unlet moors are congratulating themselves that the season so far is excellent, and justifies a hope that moors will let later in the summer, even if no one has so far been anxious to take them. The time of laying varies very much, some birds having eggs before the end of March, while others, whose first nests have been destroyed, do not lay till June. But the average grouse has hatched by the middle of the third week in May, if not before. One of the most disastrous seasons known occurred after a very heavy fall of snow, which lay on the hills during the second week in May, and killed all the embryos in the half-hatched eggs. This season there have neither been late snow, nor yet (as last year) heavy cold rains and Scotch mists in the last weeks of April and the first of May. There are practically no complaints at all based on weather conditions, consequently where a stock has been left the prospects are excellent; but it must be remembered that on very many moors, both in England and Scotland, the stock is deplorably low. Late hirers of moors should insist on seeing the records of the bags of the two last seasons in any case.

THE CARE OF PARTRIDGES' NESTS.

Partridges are exceptionally early this year. As a rule the full number of eggs is not laid before the end of the third week in May, and in many nests not before the close of the month. This year nests with five or six eggs in them were noted in many parts of the country as early as the end of the first week in May. It is not too much to say that more than one half of the season's sport depends upon the care taken of these nests during the next five weeks. By June 21st most of the young birds will be hatched. But until then the eggs are exposed to every kind of natural and artificial danger, even if the "artificial" peril (that from egg stealers) of earlier days be passed. On ordinary enclosed land, especially where the fields are large, as usually happens on the best partridge ground, a good keeper will find nearly every nest upon his beat. Mr. C. Alington makes the excellent suggestion that a rough map should be kept, with the whereabouts of each nest marked and numbered, and that the successful hatching or failure of each should be recorded, and the reasons. He gives a most interesting

table of results (in his work on "Partridge Driving") on an estate in Lincolnshire, in which the results on a single keeper's beat are recorded. The beat, a rather large one, was 1,200 acres, 400 of which were of little value for partridge land, being mostly grass and liable to disturbance.

In one season about 85 per cent. of the nests were found. In all, 104 nests were found. In the following table Mr. Alington gives the results in a good year:

Nests	104	Eggs bad	157
Eggs hatched	1,031	Eggs destroyed	401

NESTS DESTROYED AND CAUSES.

Foxes	8	Brought forward ...	28
Hedgehogs	7	Farm hands	2
Drowned off	4	Livestock	2
Deserted	2	Stoat	1
Dogs	3	Rat	1
Rooks	2	Mole	1
Mowed over	2	Uncertain	1
	28		36

This was in 1902, a good season *quâ* weather. It is noted that the proportion of nests destroyed by farm labourers, mowing, and cattle is very much below the average. The way in which partridges perish, even when the nests are known and carefully looked after, will be judged by the history of the shoot in the very next year, 1903. It was the "deluge year"; 107 nests were found, only 311 eggs hatched, and no less than 1,402 eggs were destroyed; 65 nests were deserted owing to wet, and 21 were destroyed by various vermin, livestock, or accidentally by labourers.

MAPS OF NESTS.

The advantage of noting the place of the nests on a reduced field map of the various farms is great. In the first place it is a guarantee that the keeper finds the nests. In the next it enables his master to be taken into council, and informs him where the birds are thick, where there are too few, and gives him a chance of intervening if mistakes are made. It also affords a useful gauge of the number of birds on a beat. Each nest will be numbered on the map, and a notebook, with entries corresponding to these, will be kept. It also is a very useful check on the keepers, because the owner can at any day ask to be shown any particular nest.

PROTECTION FROM FOXES.

Foxes are the great difficulty in many counties, and probably the most complete means of stopping the mischief is to substitute celluloid eggs for the partridges. Keep the real eggs under hens until they chip, and put them back under the partridge at the last minute. Reynardine is excellent till the foxes learn to associate its smell with the presence of eggs, when it simply acts as a signpost. A sportsman, whose marked success in improving a partridge estate last year was described in COUNTRY LIFE, mentions an excellent scare for foxes. They usually hunt for partridges' nests on moonlight nights. If a nest is in a hedge a couple of ordinary bright glass gin bottles laid near the fence on their sides, one a few yards on one side of the nest, and the other the same distance on the other, reflect the moonlight, and cause a fox to give them a wide berth.

KEEPER AND JUDGE.

In a remote part of Sussex the shooting on an estate had been a good deal neglected, and poaching was rife. The agent for the property, who resided at a distance, decided to rent the shooting for a term himself, and to see whether he could not improve it. He made his head-bailiff head-keeper as well, and gave him plenary powers to prosecute. The nearest magistrates' meeting was a long way off, which no doubt made it extra unpleasant for anyone who was summoned, as he had either to walk nine miles there and back or hire a trap. In the course of a few weeks the agent received the following note from the old keeper-bailiff: "Sir,—I have caught Giles Snelling poaching. I have fined him one pound. What shall I do with the money?"

EFFECTS OF LATE FROSTS.

The extreme cold of the third week in May has caused great anxiety as to the fate of the partridges' eggs in exposed and open districts. In the year 1901-2 frosts late in May destroyed three-quarters of the partridges' nests, the vitality of the eggs being ruined by exposure to cold in the early mornings when the hen birds went off to feed. When the hay, and later the corn, crops were cut the nests were found quite intact, full of "addled" eggs. As a rule partridges which have lost their eggs in this way do not nest again.

CUTTING DOWN WOODS DURING NESTING-TIME.

A case in which the defendant was described by the judge as sailing "very near the wind," reminds us how necessary a carefully-drawn lease is if an important shooting is taken. The lessee took over 1,200 acres of shooting with a house, but the shooting, not the house, was his main object in the bargain. On it were some 150 acres of woods, in separate coverts. As soon as the spring came on, to his horror the owner began to cut down the principal woods, especially those where his new stock of pheasants might be expected to nest, or to be turned into. It was poor partridge country, and these woods were practically the chief asset for shooting. It appeared that the defendant never informed the shooting tenants that he meant to cut the woods, though he admitted that when he let them that was his intention. What was worse was the fact that they were let on a lease. The plaintiff got no redress, though the defendant was prohibited from cutting more coverts down during the remainder of the tenancy. The moral is—insert into all agreements a clause guaranteeing that the woods shall not be cut down, and specifying the limits of the underwood to be cut, as well as the latest date of removal of the faggots and poles.

A GREAT FRENCH SHOOTING ESTATE.

At Vaux-le-Penil, near Melun, and thirty miles from Paris, that well-known French sportsman, M. Michel Ephrussi, owns an exceptionally fine shooting estate, on which as many as 4,000 partridges are bagged in a good season, mainly by driving. Last year 1,000 birds were successfully reared from eggs laid by birds kept in pens on the French system, by which the bird lays and hatches under cover and in safety, and then carries off its brood after hatching to bring the chicks up naturally. But though the keepers are so successful in making use of this system, in which so many failures have been incurred lately in England, the wild stock is gradually reinforced during the months of March and April by hen birds let loose in different parts of the estate. The cover afforded by sugar beet, lucerne, and sanfoin, which disappear as the season goes on, is supplemented by a rational creation of permanent remises, planted with osiers and hawthorn. Something in the nature of permanent butts for driving is afforded by lines of shelters of shrubs, planted in the best positions for driving over, and kept cut back to a height of 10ft., which screen the guns and loaders.

FRENCH POACHERS.

As it is so near to Paris poaching is a serious menace, with such a concentration of game. Apparently French poachers from the capital are more dangerous even than the gangs which come out from our Northern and Midland manufacturing centres to raid the ground game in the coverts. A large number of keepers have to be employed, and after harvest the whole force is engaged solely in protective work, and especially on night duty. Before harvest half the staff are on night duty, while the other half look after the nests, rearing, etc. So serious is the risk from encounters with poachers that the strictest orders are given that never less than three men together shall go the rounds after dark.

ARTIFICIAL PARTRIDGE EGGS.

A correspondent writes: "For some years I have noticed that the percentage of losses in partridges' nests other than by accidents caused by field work or by the destruction of the sitting bird by cats, dogs, and foxes is very large. If artificial eggs are not objected to by the sitting bird, I can see no objection whatever to their substitution while the real eggs are being hatched out under a hen, when they can be returned in the 'chipped' state to the parent bird, who has been sitting on the artificial eggs. But I should like to know what has been the latest experience in regard to these. 'East Kent,' in your columns some time ago, found the artificial eggs very useful. On the other hand, one authority thinks that birds will not own them."

RACING NOTES.

BIG fields and comparatively poor sport were the chief characteristics of the Second Spring Meeting at Newmarket. The main attraction of the meeting is the Newmarket Stakes of 50 sovs. each, with 1,500 added, which this year possessed more interest than usual from the fact that it was generally understood that Lord Rosebery's crack colt Cicero, who had not been seen in public since he

ROWLAND'S MACASSAR OIL

FOR THE HAIR.

Nothing produces such a dressy appearance of the hair, **stimulates its growth** so much, or prevents its falling off so effectually. If you have never used it you are strongly advised to procure a bottle immediately, and always use it for **your own** and **your children's hair**; it is a sure **preventive of baldness,** and is also sold in a golden colour for fair and golden hair. Sizes 3/6, 7/-, 10/6 (equal to four small).

ROWLAND'S KALYDOR

A **Lovely, Delicate, and Pure Complexion,** soft and fair hands and arms are assured to those who use this most soothing, healing, and refreshing preparation for the face and arms. It **removes freckles, redness, roughness,** and heals all cutaneous eruptions. Bottles 2/3 and 4/6.

ROWLAND'S ODONTO

White and Sound Teeth.—For preserving and beautifying the teeth, preventing their decay, and eradicating all tartarous adhesions to the teeth, there is nothing to equal this, the **purest** and most **efficient dentifrice** ever used. It imparts a **pearl-like whiteness** to them, and induces a healthy action of the gums; 2/9 per box, sold by stores, chemists, and A. ROWLAND & SON, 67, Hatton Garden, London.

won the National Breeders' Produce Stakes at Sandown Park last July, would be found among the starters. Last year the son of Cyllene out of Gas was the only colt with any pretension to be absolutely in the first class. A good many rumours had been in circulation to the effect that he had not grown during the winter, and that he was no longer the fine free mover that he was as a two year old. All doubts on the subject were, however, completely dissipated by the style in which he closed up with Llangibby and beat him easily by a length and a-half, with Signorino beaten into third place by six lengths. The result of the race proves that Cicero has retained his two year old form, but it does not prove by any means that he is good enough to defeat Val d'Or and Jardy, two sons of the expatriated Flying Fox. It will be remembered that in the Middle Park Plate Jardy beat both Llangibby and Signorino, who ran a dead heat for second place, by two lengths, in a common canter, and also that on that occasion he was giving 7lb. to Signorino. If we are to take that race as a guide, there is nothing to indicate that Cicero can lay claim to any marked superiority over Jardy, who is reported to have improved considerably since last year. The other French-bred colt, Val d'Or, is stated to be rather better than his stable companion, and it is the present intention of their owner, M. E. Blanc, that they shall both run for the Derby, which promises to be an unusually interesting race this year. As far as Llangibby is concerned, there is no doubt that he has made great improvement since last year, but I cannot look upon him as a good horse. Signorino, if the Newmarket Stakes running is correct, prefers a mile to a further distance, and the style in which Vedas won the Two Thousand Guineas "gives one to think" that a mile is as far as he cares to go. It may be that Rouge Croix will be at his best when the time comes to think about the St. Leger, but as far as the Epsom Derby is concerned I am afraid that, however reluctant one may be to do so, he must be considered as an animal of no importance. To sum up the situation, everything points to Cicero as the best of our representatives. Can he defeat the French colts? That is the question, and one which it is extremely difficult to answer. The old-fashioned Payne Stakes no longer possesses the attraction of other days, and this year's winner, Cape Verde, would cut but a sorry figure in the company of many former winners of the race. He was receiving 9lb. from Shah Jehan, and just won by a head, and personally I should not class Shah Jehan as 9lb. better than a smart plater.

Of the racing on the opening day of the meeting there is not much to say. Some of the "Rosebery luck" seems to have descended to Lord Dalmeny, for whom Caravel brought off quite a useful coup in the Trial Plate of 400 sovs., and was bought in for 900 guineas. Quite a respectable field went to the post for the Newmarket Handicap of 1,000 sovs., which resulted in a really fine race, the feature of which was the running of Pharisee, who carried his 9st. 9lb., which included a 12lb. penalty, like the game, honest, and thoroughly-trained horse that he undoubtedly is. A word of praise is also due to the winner, D'Orsay, who, hard ridden from the Bushes, and challenged right and left by Antonio and Pharisee, held his own to the end, and won all out by three-quarters of a length.

On the Wednesday backers who remembered what took place at Sandown Park had a capital opportunity for recovering their money with interest, for Mr. A. H. Ruston's Early Bird made ample amends for the previous mishap, and fairly worried Sermon out of the Flying Handicap, which he won in decisive style by a length and a-half, starting at the very useful odds of 6 to 1. The race for the Newmarket Stakes has already been alluded to, and the remainder of the racing calls for little comment. To give 7lb. to such a horse as Nabot is no light task, but Imperial II. had apparently no trouble in doing so in the Abingdon Plate, which he won by a couple of lengths, after making all his own running, and thus he fully bears out the opinion expressed some time ago in these notes, to the effect that he was probably the fastest sprinter in training. The race for the Breeders' Stakes of 200 sovs., which was won by Sir J. Miller's Alcanzor, the recently-named colt by Sainfoin out of Aida, brought a very uninteresting meeting to a close.

A charge of venue found most racing people assembled at the cheery and popular Gatwick Meeting, which was favoured by the most ideal weather conditions. Sweet Mary continued the unbroken series of her victories by cantering home at her leisure for the Worth Stakes six lengths in front of Fruitful and Fairlawn. Lord Farquhar's Airlie improved upon his position of fourth behind St. Brendan and Thrush and Brother Bill at Kempton Park, and by winning the Alexandra Handicap from Melayr and Countermark rewarded those who had noticed and remembered the fine burst of speed which he showed for over six furlongs in the Lincoln Handicap.

Gatwick, under the *régime* of thoroughly capable and enterprising management, is always a popular fixture with racegoers; and that the two days' racing, which commenced on Friday, the 19th inst., were thoroughly appreciated, was clearly shown by the crowded state of the various enclosures. The Alexandra Handicap of 1,000 sovs. constituted the *pièce de résistance* on the first day, and financial support was forthcoming for at least six out of the eight horses which went to the post. Helter Skelter was nominally favourite at 5 to 2, but there was practically no difference in that respect between Mr. Dugdale's horse and Airlie, who was quoted at 3 to 1. Against Edicius, who is invariably a source of trouble at the gate, 8 to 1 was laid, and found some takers, although it is at least that rate of odds against his getting off at all. Owing to his antics there was considerable delay at the post, and when the barrier did go up he whipped round and was left. Airlie jumped into his bridle, and made the running from Melayr, King Duncan, and Countermark. In a strong run race Airlie was never headed, and, winning in a canter, presented his owner, Lord Farquhar, with an acceptable birthday present. Apparently nothing can make Sweet Mary gallop, over these four-furlong courses at all events, and she added to her sequence of wins by cantering home six lengths in front of her field for the Worth Stakes.

Saturday, the second day of the meeting, provided even better racing than that which had been witnessed on the preceding day, and the Messrs. Pratt may be most sincerely congratulated upon the manner in which the public recognise their efforts to provide good sport. There was plenty of speculation when the betting opened for the Prince's Handicap of 500 sovs., but Long Tom was made favourite at 5 to 2, and when it came to racing he amply justified his position. On coming into the straight he drew clear, and, making the remainder of the running, won easily by three lengths, being followed home by Kilteel and Ferment. In the Marlborough Stakes Mr. H. J. King's Esquire made some amends for his bad performance in the Newmarket Handicap, and by beating Lady Yatesbury and Costly Lady recovered a considerable portion of the 820 guineas which his present owner paid for him when he was drafted out of Lord Falmouth's stable last back-end. As a two year old this colt was fairly smart, but for some reason or other he seemed to have completely lost his form, which would now appear to be coming back to him under Felix Leach's skilful management. Mr. R. H. Henning's El Re, ridden by F. Bullock, came in first for the Rook Plate, but was disqualified owing to an objection lodged against his rider for hitting Symmetrician more than once on the head with his whip. Morny Cannon, who rode Symmetrician, is not in the habit of raising frivolous objections; in fact, I believe that during his long career as a jockey he has only made four objections of any sort. There can be no doubt that El Re was justly disqualified, but at the same time I do not think that Mr. Henning's jockey made an intentional misuse of his whip. A very pleasant meeting came to an end with the race for the Apprentices' Plate, which Gamaliel, ridden by Walter Griggs, won by three-quarters of a length for Captain J. G. R. Homfray.

At Haydock Park Catty Crag, who is rapidly becoming a popular favourite after the style of Victor Wild, carried off the Haydock Park Handicap, giving 10lb. to D'Orsay, the winner of the Newmarket Handicap, and beating, moreover, such horses as Bachelor's Button, Whistling Crow, Glenamoy, Sandboy, and others. He had practically won his race all the way; but Wheatley had waiting orders, and only allowed his mount to stride out just before the distance, when he immediately shot to the front, and won cleverly by a length. Just now Catty Crag is quite in the first class of handicap horses, and if he could be sent to the post for the Cambridgeshire in anything like his present form, he would require a great deal of beating.

A cold snap has set in again, and at the time of writing it is snowing hard in parts of France. As at present arranged M. E. Blanc's horses, Val d'Or, Jardy, and Caius, will cross over during this week. Muskerry, who was to have accompanied them, ran so badly in the French Oaks on Sunday that she will not make the journey, and it is a curious fact that whereas nearly all the Flying Fox colts are good, he has not yet sired a really good filly, though I am told that Queen of the Earth was unlucky to be beaten in the One Thousand Guineas.

THE AUTOMOBILE WORLD.

A NOVEL point in connection with the use of motor-cars has arisen in consequence of the sudden death from heart disease of a gentleman who was driving his own car the other day at Horley. The question has therefore been raised in the Press as to what can be done in similar circumstances by a passenger in order to stop the car. "I frequently ride on a friend's motor," says a correspondent of a daily paper, "with my friend driving. I know nothing of motor mechanism. If my friend had a fit or were suddenly to expire while the car was travelling at twenty miles an hour, I should be helpless. What handle am I to pull, what wheel am I to turn, to stop the motor? Surely some simple explanation could be given to the public generally as to the method of stopping the car." One would have thought that the writer of the letter referred to might preferably have interrogated his friend in the first instance; and, in any case, he must have been particularly unobservant ere he could write such a phrase as "what wheel am I to turn to stop the motor?" The only wheel turned by the driver of a car is the hand-wheel by which the steering is controlled, and obviously it has no relationship to the management of the engine.

That the position would be awkward if a driver did become incapacitated is undeniable. It would be far from hopeless, however, and for the benefit of those who may consider the possibility of such a happening in their own case, I may proceed to analyse the factors in the equation with a view to showing what it is possible for the passenger to accomplish. Parenthetically, I may remark that incapacitation is rarely, if ever, of instantaneous occurrence. Inasmuch as the driver is necessarily more or less always on the alert, and as his finger, as it were, is always on the pulse of the engine, the moment he felt his physical or mental powers failing in any way, he would himself as far as possible stop the car. Nearly every car has a clutch-pedal, which has only to be pressed to disconnect the engine from the driving gear; every car, moreover, has a brake-pedal, which is powerful enough to pull the car up when the engine is disconnected. The driver's feet are always actually on or in close contact with these pedals, and pressure of either or both is practically instinctive when occasion requires. I remember a case at Southport when the speed trials were held there in 1903. At five o'clock in the morning two or three of the competitors were making a preliminary trial of their cars on the track. A high wind was blowing, and as Mr. W. du Cros was turning out of a side street on to the track, a gust of wind lifted up the bonnet, which was not strapped down as usual to the frame of the car. On touring cars the bonnet never comes further backwards than a vertical position, but as the bonnet in this case was exceptionally long, owing to the size of the engine, and the dashboard was low, the bonnet swung far enough back to strike the driver in the face and effectually stun him. Just before lapsing into unconsciousness, however, he instinctively pressed the pedals and stopped the car, even before his mechanic took charge of the situation.

AN ENTRANT FOR THE FRENCH ELIMINATING TRIAL.
The new Renault racer with under-slung body.

Let us assume, however, that the driver has become unconscious with dramatic suddenness. We must also assume that there is a passenger to his left, for if he had only one companion he would probably be in the front seat. From his position he could not conveniently reach the hand-brake. The clutch-pedal, however, would be quite accessible, and possibly he could apply the brake-pedal also. Absolutely the quickest way, however, of bringing a car to a standstill is to turn off the electric current and stop the engine instantaneously; not only, in fact, is the engine stopped, but it would then itself act as a powerful brake upon the car. The switch is usually placed upon the dashboard—not invariably within easy reach of the driver himself, though oftener than not, but certainly always in a position which is accessible to the passenger. Any person, therefore, who is

H.R.H. PRINCESS CHRISTIAN'S CAR.
A 24 h.p. Thornycroft with landaulette body.

apprehensive on the subject should ascertain, when he mounts a car, where the switch is placed. After moving the switch, in case of our imagined dire extremity, the passenger should seize the steering-wheel and keep the car as straight as possible until it has come to a stop. If he has a cool head it would be far better for him to do this first before thinking about the switch, or about stopping the machine at all. He could not steer it accurately, of course, but on a country road the probabilities are that if nothing were in the way he could keep the car from actual collision with the side of the road until it had come to a stop. He must bear in mind, however, that if he has not been able to switch off he must keep the clutch-pedal down, or the engine will take up the running again; per contra, if he has been able to switch off he should not touch the clutch-pedal, or he will get no benefit from the braking power of the engine, but must try to depress the foot-brake, if he can get at it, instead of the clutch-pedal. On most cars, unfortunately, the brake-pedal is on the right-hand side, and therefore less accessible in the peculiar circumstances under discussion; on the Orleans, Wolseley, and one or two other cars, however, this position is reversed, and the brake-pedal is the one nearest to the passenger.

Speaking generally, however, the situation is by no means as critical as it may appear on paper. Anyone who wants to know how easily a car can be stopped under normal conditions has only to ask the driver at any moment to bring the car to a standstill. He simply depresses both feet, and the thing is done. The only new factor in the situation, therefore, in the possible event of a driver suddenly succumbing, is the fact that his body is to some extent in the way of the passenger who wishes to assume control, and that the car may have swerved aside before he can do anything practical himself. If the car is in the middle

THE INCOMPARABLE

"WHITE"

From the "AUTOCAR,"

APRIL 22ND, 1905.

"All the ancient disadvantages of a steam car—to wit, the failure to make steam after a rush uphill, the frequent stoppages to replenish the water supply, etc.—are past and gone with the 15-H.P. White. Fitted with a most efficient fan-cooled condenser, one tank full of water suffices for a run of 150 to 200 miles. Steam is seldom, if ever, shown, and the manipulation of the throttle valve alone serves to vary the pace of the car from a veritable crawl to the maximum speed obtainable. The brakes, moreover, though powerful and efficient, are only required for emergency stops; the throttle is sufficient and to spare for all ordinary purposes. The silent running is too well known to require emphasis, while the improved springing and lengthened wheelbase of the 15-H.P. make the car as comfortable and easy riding as any in the market.

"There are other points in relation to a White steam car with which I have no space to deal, but I may summarise the total of my week with a White by the remark that in the driving and handling of one of these cars those whose experience of automobilism has hitherto been restricted to the explosion engine will find many pleasant experiences."

HARRY J. SWINDLEY.

BROTHERHOOD

. . CAR . .

(20 H.P. 4 CYLINDERS).

"We had an opportunity of trying the new Brotherhood, under the expert control of Mr. Percy Richardson, who has been mainly responsible for its production. The point which struck us most was the excellence of the Carburetter, which allowed of the engine running efficiently at something like 150 revolutions per minute. In fact, Mr. Richardson drove us for miles through traffic without ever taking the clutch out, and at times the pace was a regular crawl. The control is altogether effected by a side movement of the right foot. There could not possibly be an easier way of application or more instantaneous. In fact, taken altogether, the control of this car is perfect. We noticed, too, that it picked up with extraordinary rapidity. At one moment we would be crawling through dense traffic, then an opening would suddenly occur, and a slight movement of the toe would send the car bounding forward like a projectile, only to be pulled up further on, as the traffic closed in, almost as quickly. The way Mr. Richardson handled the car was a liberal education in what can be done with a good motor. In this car the flexibility of the engine was good, while for power it seemed extraordinarily efficient, to judge from the one or two short bursts we were able to indulge in."—*Extract from MOTOR NEWS, March 4th, 1905.*

of the road, however, its natural tendency will be to keep straight, as is shown by the fact that one may see drivers putting on their gloves while maintaining full control over the vehicle at the same time. COMMUTATOR.

HINTS FOR BEGINNERS.—III.

A NEW car, fresh from the hands of the coach-builder, is usually "a thing of beauty," even if the remainder of the quotation is not always equally applicable; for the beauty, alas! is apt to be of a transient nature when subjected to the ministrations of the average paid driver. To clean a car is a long and tedious job, and not one man in half-a-dozen will carry out the work in a thorough manner if left to his own devices. It may be want of skill or want of energy, but the result is the same. Personally, I always judge a man very much by the condition in which he keeps his car, as, although it sometimes happens that a good mechanic and a skilled driver is a very poor carriage-washer, and *vice versâ*, yet, as a rule, the man who takes a pride in the appearance of his car has the makings of a good motor servant, even though he may for a time be wanting in mechanical skill or driving experience.

CRAIG WILLIAMS HILL.
An open stretch on the Isle of Man course.

The most critical period, as I have said on a previous occasion, in the life of the mechanism of a car is the first few weeks of its existence. The same rule applies to the carriage-work, though it is surprising what rough usage the varnish will stand when it has once got thoroughly hard. For this reason, cars bought from stock, after standing some weeks or months in a showroom, will often retain their pristine appearance far longer than those which are taken from the coach-builder by impatient purchasers before the varnish has had time to set. In either case, however, the greatest care should be taken over the washing process on the first few occasions that the car is used, and if it can be prevented, neither mud nor rain should be allowed to dry on the carriage-work. It is a curious fact that rain-water will sometimes leave almost indelible stains on new varnish, while certain kinds of mud, particularly from limestone roads, are even more fatal in their effects.

It may appear somewhat superfluous to deal with the actual process of washing down, but there are certain precautions which should be observed which are unnecessary in the case of an ordinary carriage. In the first place, separate leathers, sponges, and brushes should be used for the body, and the wheels, axles, and framework. Oil and grease are certain to be splashed from the mechanism on to the latter, and if the same washing utensils are used for every part of the car, the whole of the exterior will quickly acquire a dull and greasy appearance. Oil is most injurious to varnish, and it is therefore necessary to prevent it encroaching on the panels and other conspicuous portions of the body, and also to remove it as thoroughly as possible from the framework and wheels. Water alone is almost useless, and little good results from mixing a small quantity of petrol with the washing water, a remedy which is often recommended. Petrol or paraffin undiluted are perfectly efficacious, but do more harm than the grease which they remove. On the whole, the best plan to adopt, after the mud and dust have been washed off in the ordinary way, is to go over the oil stains with a little soap on a sponge, and give a final rinsing with rain-water if it is available. This will leave the varnish spotlessly clean, although in time it may have a slightly dulling effect.

Generally speaking, the more frequently a new car is washed the better, as the water has a hardening effect on the varnish. If a hose is used, the pressure of the jet should be very slight, as any force will cause the mud and dust to scratch the surface. Care should, of course, be taken to prevent the water getting inside the bonnet; and a car should never be washed when the tyres are deflated, as it would inevitably result in the rotting of the fabric of the covers. A really good motor man will take just as much pride in the appearance of his engine and transmission gear as he does in the exterior of the car. No one who has a real fondness for machinery would tolerate rust and dirt for an instant, and an ill-kept motor is a sure sign of a slovenly and careless driver. For the benefit of the owner who proposes to be his own mechanic, I may say that old rags are pleasanter to use than waste for cleaning purposes, and that a painter's brush, of the kind known as a sash-tool, and a bowl of stale petrol will greatly assist him in the operation. The latter should be used only in the open and away from any light, and the engine should not be started until the petrol has thoroughly evaporated, as the external spark-gaps, still fitted on some cars, or the heat of the exhaust-pipes might ignite the vapour. F. P. A.

ROAD MAXIMS FOR MOTORISTS.

THE formation of a Considerate Driving League comes at an opportune moment, when the misbehaviour of a small minority of motorists, and the occurrence of a regrettable number of accidents, have caused a recrudescence of that anti-motorist feeling among the general public which in the past has done so much harm to automobilism. The maxims to be observed by members of the league have been drawn up by the Hon. John Scott Montagu, M.P., and though their propriety may appear obvious to every careful motorist, and there may be a disposition to regard the new association as superfluous on that account, yet we think that the deliberate acceptance of the code by all reasonable motorists would greatly help to convince the public that they are anxious to observe the courtesies and traditions of the road. So far as paid drivers are concerned, concrete suggestions are infinitively more effective than vague admonitions, and the presence of the regulations, hung in a conspicuous position in the motor-house, may serve to remind them of their duties towards those who are restricted to less modern forms of locomotion. Much of the reckless and inconsiderate driving that takes place is due to ignorance and want of judgment rather than to deliberate disregard of the safety and convenience of others. The mechanic taken from the shops and placed at the wheel of a powerful car, as a rule, has had no previous acquaintance with the traditions of the highway, save such as he may have acquired by riding on a tram or omnibus. The results are only too well known; but henceforth, with a definite code of road maxims before him, the driver-mechanic will have little excuse for want of consideration for

"A VERY EXCELLENT CAR."

Automotor Journal, Feb 10th, '05.

"This new vehicle is—as we have previously been able to mention—well worth the attention of those requiring a really good all-round car for general work and for touring purposes, for, although it possesses nothing startling in the way of radical departure from the best accepted practice, it has obviously been designed by those who are thoroughly acquainted with what has already been done by other automobile manufacturers, and who possess a thoroughly sound engineering knowledge that has stood them in good stead. Possibly the two characteristics that stand out most prominently are the unusual strength of the entire chassis, and the remarkable facility with which all vital parts of the mechanism have been rendered accessible from beneath, for both these features are very strongly marked."

Drive Slowly

(1) Through towns and villages.
(2) When approaching cross-roads or turning corners.
(3) When passing schools, cottages, and churches.
(4) On dusty or muddy roads when passing cyclists or pedestrians.

A PETROL CAR FOR TOWN USE.
Lady Tenterden's 16 h.p. James and Browne landaulette.

(5) When meeting or overtaking lady cyclists, and do not steer too close to them.
(6) When entering a main road from a side road.
(7) When you see a drunken man in the road.
(8) When passing any live animals on the road—cows, sheep, dogs, etc.

Stop

(1) When an accident of any kind occurs. Render all the assistance in your power, and, as a safeguard against future proceedings, ascertain the names and addresses of a few witnesses.
(2) When you see any likelihood of a horse becoming restive. If necessary, do this even before the driver holds up a warning hand.

Always Assume

(1) That other road-users may do the wrong thing, *i.e.*, a driver may pull the wrong rein, or a pedestrian hesitate and try several courses.
(2) That it is your business, not the other man's, to avoid danger.

The road is free for all; therefore, be courteous and considerate, and always drive like a gentleman.

THE CONTROL OF COMPETITIONS.

In the general chorus of praise which has greeted the new competition rules of the Automobile Club one dissentient note has been heard. It is contended that their application is too wide, and that the stringency of their provisions will tend to prevent the holding of minor and semi-private events by the smaller and less wealthy provincial clubs. We think that there is much to be said in support of this contention, and we hope that the club may see its way towards some relaxation of the rules in certain clearly-defined circumstances. Great care, however, will have to be exercised if the usefulness of the competition rules is not to be destroyed. Owing to the non-existence of any proper code and the absence of central control, automobile competitions, hill climbs, speed tests and the like, were in danger of falling into disrepute. Many abuses had crept in, and quarrels and even legal proceedings were no uncommon sequel of provincial meetings, which sometimes appeared to be run mainly in the interests of one or two particular firms. As a result the amateur element was becoming rare, and the public were beginning to regard all motoring events purely as a form of trade advertisement disguised under the name of "sport." The Automobile Club has been handicapped in its attempt to check abuses by the want of a code of rules applicable to every circumstance, such as exists in the case of horse-racing. After more than a year's constant work a special sub-committee has recently finished the compilation of the new competition rules, which have been approved by the club committee and made public. They are certainly of a stringent nature, but not more stringent than experience has shown to be necessary when the bulk of the competitors are striving for victory, not from a love of sport, but purely in order to advance their business interests. There are competitions of another character, however, which are worthy of every encouragement, and we would suggest that where an event is restricted to cars which are driven and owned by members who are not directly or indirectly engaged in the motor industry, the full severity of the club's rules might well be relaxed.

The cars are mentioned in the order in which they will start, but it should be explained that the numbers 5 and 8 have not been allotted, as it was thought that they might be confused with each other, or with number 3, when the cars bearing them were travelling at high speed; such, in fact, was actually the case last year.

The course to be used will be identical with that of the Trial of 1904; sundry suggested alterations have been considered, but have not been found to be desirable. The total distance round the circuit, including controls, is 51 miles 1 furlong, and in all probability the cars will traverse these as many times as possible within a given period of eight hours. In addition to the data afforded by the finishing times, the Selection Committee will also be influenced by speed tests against time over a mile on the flat in each circuit, and speed tests against time in climbing a hill in each circuit. Due notice will also, of course, be taken of the skill and suitability of the respective drivers, and also of the condition of the cars at the finish of the trial. The latter, however, will be confined to one day, and there will be no hill-climbing trial at Ramsey, as was the case last year, nor speed trials on the Parade at Douglas. Wednesday will be devoted, however, to a motor-cycle race, in the nature of an Eliminating Trial, for the selection of the British team for the International Motor-cycle Cup Race, and also for a race for the *Motor* Cup. The best place for seeing the race is at the summit of Snaefell, to which access is easy, as there is an electric railway up the mountain-side. Those who wish to see the cars in full flight should certainly take their stand on Snaefell. On the other hand, Quarter Bridge will be the chief centre of activity throughout the trial, and will witness both the start and finish.

Motor Union Inter-club Meet.

The most interesting automobile gathering that has been held for some time was the Motor Union Inter-club meet at the Dukeries last Saturday. It brought together a record muster of no less than 150 motor-vehicles, of which all but nine were cars. Visitors came from all points of the compass, the clubs represented including the Automobile Club, and the following among other affiliated clubs: Midland, Yorkshire, Sheffield, Nottingham, Leicester, Manchester, Derby, Leicestershire, Eastern Counties, Southern, Berkshire, and Huddersfield. A meeting of the general committee of the Motor Union was held at Nottingham in the forenoon, the members of the local club providing seats on their cars for those members of the committee who did not drive down. In the afternoon large numbers of other cars arrived, and a procession of formidable proportions left the Victoria Station Hotel about two o'clock for Mansfield and Welbeck Abbey, to which the Duke and Duchess of Portland had kindly extended an invitation. Other cars had been steered direct to Welbeck without passing through Nottingham, and the final muster attained the dimensions already stated. On arrival the visitors were welcomed by the Duke and Duchess in person, and were conducted by guides over the subterranean galleries, etc., for which the Duke's estate is famous. Subsequently the procession was re-formed, and, headed by the Duke and Duchess in their Mercédès landaulette, set off for Edwinstowe, where afternoon tea was taken. Nature was looking her best in Berkland Forest and Sherwood Forest, where several fine herds of deer were encountered, and the journey proved enjoyable in the extreme. At all turning-points along the outward journey, and again on the road from Edwinstowe to Nottingham, the Nottinghamshire police were stationed, and rendered valuable assistance, in acknowledgment of which the guests at the dinner, which was held later in Nottingham, subscribed a sum of £20 to be devoted to whatever object the police preferred. The Hon. Arthur Stanley, M.P., chairman of the Automobile Club, presided at the dinner, and expressed the opinion that automobilists were suffering for the sins of the few, and that every effort must be made to suppress the motor hooligan.

Alcohol *v.* Petrol.

At the Hotel Cecil, on Friday evening, the Society of Motor Manufacturers and Traders held a dinner, with a subsequent discussion on the Alcohol Committee's report. Dr. Ormondy, the chief apostle of the industrial alcohol movement, was present, and made out as good a case as he could for the substitution of that spirit for petrol. It became clear, however, after hearing the speeches of two members of the Alcohol Committee—Mr. Scott Montagu and Mr. Tyrer—that that body had had no option but to condemn the use of alcohol, for the present, at all events. It cannot be produced a cheaply as petrol, nor has its efficiency been proved to be equal to the spirit now in general use in cars. All the reasons, in fact, in favour of the use of alcohol are sentimental. It would benefit agriculture, it would be home-grown instead of imported, the increased cultivation of the potato would increase our food reserve in time of war, and also prevent the fear of a spirit famine; and in various ways alcohol would theoretically be preferable to petrol. Unfortunately, however, circumstances at present are all against it, and it will undoubtedly be a long time before anything is done in the way of effecting the vital change that has been suggested.

The Auvergne Circuit.

For some weeks past the question of the suitability of the Auvergne Circuit for racing purposes has been keenly debated both in this country and in France. All the drivers who have practised on the course have described it as extremely difficult, but opinion has been divided as to the necessity of establishing controls, some maintaining that they are absolutely necessary if disaster is to be avoided, others declaring that the original plan of

THE
DE DIETRICH

Three extracts from letters received from our customers who are delighted with the 1905 Models.

London, May 13th.
16 h.p. in Traffic.

"Miss —— writes to say that she is very pleased with the 16 h.p. car, and **the way it can be used in the traffic of the streets is most satisfactory.**"

London, May 6th.
24 h.p. on the hills.

"I am very pleased to tell you that the 24 h.p. De Dietrich that you supplied me with has now run 2,000 miles, and I have never had a stop. On the hills **she is very fast, and simply magnificent,** and the way the car can be **controlled in traffic, even on the top speed, surprises all my friends whom I have taken out with me on the car.**"

Edinburgh, May 12th.
40 h.p.
Running beautifully. Giving entire satisfaction.

"I am very well pleased with the 40 h.p. **She is running beautifully, and is giving me every satisfaction.**"

These extracts are selected from many letters which we have received, all speaking in the highest possible manner of the running of the car, and also of its silence and reliability. (THE ORIGINALS CAN BE SEEN.)

an interrupted race from start to finish was to be preferred, as imposing a more severe test on the competing cars. The dispute has been finally settled by the intervention of the Minister of the Interior, who has insisted that there shall be three enforced halts in each round of the course. These will be at Laqueuille, Pontgibaud, and Rochefort. At the two former places the cars will be stopped and started again at intervals of 3min. Where a car is more than 3min. behind its predecessor it will be allowed to proceed immediately. At Rochefort the competitors will be required to make merely a momentary halt. There is no question that the precautions insisted upon by the French Government will diminish the dangers of the Auvergne Circuit, as they will greatly lessen the amount of passing on the more narrow and winding portions of the road. It must not be supposed, however, that the possibility or even the probability of serious accidents has been eliminated, and the opinion has been freely expressed that the results of the French Eliminating Trials will be of such a disastrous nature, that the Gordon Bennett race itself will never be held. This is, perhaps, an extreme view to take of the dangers of the course, but the results of the trials will be awaited with no small amount of anxiety. In response to repeated complaints from the inhabitants, the Minister has also forbidden any further practising on the course.

THE MIDLAND AUTOMOBILE CLUB HILL-CLIMB.

This event, originally fixed for May 27th, has been postponed until Saturday, June 3rd, when, with the kind permission of Baron Max de Tuyll and Mr. A. D. Flower, it will be held in the private grounds of Middle Hill, which is about 1½ miles from Broadway, Worcestershire. The contest will be open only to cars entered and driven by members of the club, and will, of course, be run under the competition rules of the Automobile Club of Great Britain and Ireland. The cars must be fully-equipped touring vehicles, and carry the number of passengers for which they are built. Three classes are provided: For cars not exceeding 8 h.p.; for cars exceeding 8 h.p. and not exceeding 18 h.p.; for cars exceeding 18 h.p. and not exceeding 25 h.p.; for cars exceeding 25 h.p. Horse-power for the purpose of this classification shall be the maker's stated horse-power. The hill-climbing formula is as follows:

$$\frac{\text{Time in seconds} \times \text{H.P.}}{\text{Total weight in lbs.}}$$

The horse-power will be ascertained as follows:

$$\frac{(\text{Cylinder dia. in ins.})^2 \times \text{no. of cylinders.}}{3}$$

A MOTOR-CYCLE PENALTY RUN.

A most interesting competition for motor-cycles was recently held under the auspices of the Auto-Cycle Club. Nineteen riders on motor-bicycles and tricars (the latter numbering three) were despatched from Thames Ditton at 2.30 p.m. upon a 100-mile out-and-home run on the Portsmouth Road, any dismount or stoppage of the road-wheel (except for traffic and for the turn) entailing a fine of 6d., whilst any failure to complete the distance in six hours would result in a fine of 2s. 6d. Five hours was the minimum time, and any faster time than this meant disqualification. At the expiration of two minutes over the minimum time four men returned, and within a quarter of an hour sixteen riders had aarived, the last man to finish being a quarter of an hour later. Seven had completed the run without a stop of any sort, five had stopped to replenish their petrol tanks, one of them losing an extra 6d. for stopping to pick up his hat. The other stoppages were of a paltry character, a choked feed pipe, a broken high-tension wire, a puncture, a stoppage of the petrol feed, and a slipping belt being characteristic. The only one of a more serious nature was a cracked bearing cone of a tricar's side wheel. One rider finished the last half mile *à la* hobby horse, his petrol having run out and his machine being minus pedals. A further competition amongst the successful seven will probably be arranged in order to decide the destination of the prizes.

ITEMS.

It would appear that the belt-driven car is by no means extinct, as the Russian Government has recently placed an order for fifty Delahaye cars of the old belt-driven type, as it was found, after exhaustive tests, that this system of transmission was the only one which would stand the strain of running over the very bad Russian roads. The Delahaye firm is one of the oldest in the motor industry, and, needless to say, their modern cars are in every respect thoroughly up to date. The British agents in this country for Delahaye cars are Messrs. Perman and Co. of 29A, Charing Cross Road.

The Hon. C. S. Rolls and Mr. Charles Jarrott have tendered their resignations as members of the British Empire Motor Trades Alliance. Whilst strongly sympathising with the objects of the alliance, they consider that their trade interests do not justify their continuing as members under present circumstances. For the same reason Mr. Claude Johnson, to whose initiative the Alliance owes its formation, has tendered his resignation as honorary secretary.

Cannstatt Mercédès, Limited, have issued a useful little pamphlet entitled "Mercédès Points," which gives a short *resumé* of the principal features of a Mercédès car with driving instructions. Thus, the novice is told, when starting the car from rest, to "advance the spark a quarter-turn and shut the throttle. Press the clutch pedal firmly down and push the speed lever into the forward portion of the middle quadrant. Take off the side brake and let in the clutch gently but without any hesitation. . . . The car should *not* be driven on the clutch, *e.g.*, when slowing up for a corner, etc., do not declutch, but shut the throttle." The little book should be of interest to owners of Mercédès cars, and can be obtained on application to 127—130, Long Acre.

The Sirdar Rubber Company wish to state that although they have not yet made any increase in the price of their tyres, yet they are seriously considering the matter in view of the rise in the market price of rubber.

At the hill-climbing competition held by the Royal North of Ireland Yacht Club at Cultra, the fastest time for all classes was accomplished by Mr. R. E. Workman's 14 h.p.. four-cylinder Minerva, which beat many well-known cars of higher horse-power.

The New Engine Company has opened a large repairing workshop at Acton, opposite the tramcar depôt in the Uxbridge Road.

AUTOMOBILE CORRESPONDENCE.

SIR,—No one can deny the fair and temperate manner in which you deal with the unfortunate accidents due to the ever-present motor; but to compare those which are owing to the few motors which at present exist to those due to the much more numerous horse-drawn vehicles is, I submit, neither here nor there, because every accident should be traced to its true cause. In the case of motors, four out of five of the accidents, not to mention the danger and annoyance to others, can be traced to the speed having exceeded the legal limit; and one can foresee no remedy until the general tone of motorists—I mean those of the better class—is, as regards this portion of the law, altered. I suggest, as a beginning, that the Automobile Club should deny their certificate and refuse further membership to those who have been found guilty of exceeding the legal limit of speed.—HEDGEROW.

CRICKET NOTES.

IT is a well-known fact in boxing that it is no use being able to take punishment if one is not also capable of administering a fair share of the same to one's opponent. The same thing applies in cricket. If batsmen are content to remain entirely on the defensive and are afraid to have a go at the bowling, it is certain that, if there is anything at all in the attack, the defence will come to an ignominious end. A bowler who finds that his loose balls are not punished, and that the greatest respect is shown to an ordinary ball of fairly good length, can afford to try experiments, and, if he has a head on his shoulders, will not be long in discovering the weak spot in the defence. On the other hand, a free hitting, resolute batsman who not only punishes the slightest mistake on the part of the bowler, but forces runs from really good balls whenever possible, often succeeds in taking the sting out of the attack and in demoralising the bowler.

The performance of the Gentlemen of England on Friday can only be described as flat, stale, and utterly unprofitable. Things might have been different, perhaps, if C. B. Fry had not experienced another slice of the bad luck which seems to pursue him when playing against the Australians. The bowling, although good, did not seem to be particularly deadly, but Warner was the only batsman who had the courage to tackle it. Captain Wynyard managed to put together the respectable total of 61; but his cricket was anything but free and clean, forcing strokes were few and far between. Perhaps the less said the better about the way in which Beldam and McDonell were run out, but such things should not occur in first-class cricket. In the second innings matters were even worse. The pitch, it is true, may have been slightly affected by the rain which had fallen during the night, but not sufficiently so to account for the wretched exhibition of cricket which took place. The score is the best comment that can be made on the performance—"Gentlemen of England all out for 66!" It sums up the situation, and speaks eloquently of the "rot" which set in.

Armstrong's great innings of 248 not out on Friday was a magnificent display of batting. He scored freely all round the wicket, and is evidently master of every kind of stroke. From 12.15 till ten minutes to six he not only set a strong attack at defiance, but literally "went for" the bowling. Few batsmen can hope to rival this wonderful performance, but many can imitate this brilliant player by refusing to content themselves with simply endeavouring to keep their wickets intact. There are occasions, it is true, when the stone-walling style of play is of the greatest service, but when not absolutely necessary such cricket is very unattractive.

The pace at which the ball comes off the ground on some of the pitches at Lord's is apt to be very deceptive, and Newland, who was deputy wicket-keeper for the Australians in place of Kelly, was constantly at fault in his timing of the ball. For the Gentlemen, H. Martyn kept wicket well throughout the innings; many of the fastest balls were taken cleanly and close up to the wicket, and the catch by which he dismissed Syd Gregory was a brilliant example of the wicket-keeper's art. Considerable credit is due to Brearley for his bowling; he maintained his pace consistently throughout a long and tiring day, and, in spite of unusually severe punishment, sent down very few loose balls. The fielding of the Gentlemen, taken as a whole, was distinctly above the average.

Defeated but not disgraced, the Oxonians, all things considered, made a respectable show against a much stronger eleven in their match against the Australians. In the first innings the Hon. C. N. Bruce played sterling good cricket, and in Udal the 'Varsity evidently possess a fast bowler considerably above the average. Not only did he get wickets, but he often got the batsmen into difficulties. Taking it all round, it was no mean feat on the part of the Oxford men to get rid of their opponents for 241 in the first innings and 266 in the second.

The announcement that the Hon. F. S. Jackson has accepted the captaincy of the English team to meet the Australians at Nottingham on Monday, May 29th, is a very welcome one. Not only is he sure to make an excellent captain of the team, but however hard pressed his side may be, and however badly things may be going, nothing can ever shake his nerve and confidence. One can always be sure that he will rise to the necessities of the occasion.

C. B. Fry is in wonderful form this season, his record of 608 runs for six innings, of which two were not outs, with one score of 201, and an average of 152, will take a good deal of beating. He has not yet, however, equalled the performance of W. G. Grace, who, if we are not mistaken, had made 1,000 runs before the end of May in 1895.

Fine scores were made last week by W. W. Armstrong at Lord's, 248 not out; Iremonger, 239, at Nottingham; Hirst (not out), 187, at Leicester; C. J. B. Wood (not out), 117, also at Leicester; and E. W. Mann and Baker 147 and 102 respectively at Cambridge.

The match between Yorkshire and Leicestershire will long be remembered in the annals of cricket. It is a noticeable characteristic of the Yorkshire eleven that such a thing as a "rot" setting in is practically unknown; if some of them fail, others take up the burden and come to the rescue, and one and all they play for their side. Thanks to some fine batting by C. E. de Trafford, C. J. B. Wood, Whitehead, and Coe

Dewar's

The Whisky of MANY Merits.

Leicestershire compiled the satisfactory total of 419 runs, to which the Yorkshiremen responded with the still better one of 515, out of which George Hirst was responsible for no less than 341. This is the sixth highest individual score on record in first-class cricket, the others being 424 by Mr. A. C. Maclaren for Lancashire *v.* Somerset, at Taunton, July 16th, 1895; 365 by Mr. C. Hill for South Australia *v.* New South Wales, at Adelaide, December, 1900; 387 by R. Abel for Surrey *v.* Somerset, at the Oval, May 30th, 1899; 344 by Dr. W. G. Grace for the M.C.C. *v.* Kent, at Canterbury, August 4th, 1876; and 343 (not out) by Mr. Percy Perrin for Essex *v.* Derbyshire, at Chesterfield, July 19th, 1904.

Hirst's great innings can only be described as superb cricket. He maintained a complete mastery over the bowling, was hardly ever at fault in timing the ball, and his placing was remarkable for its accuracy. Playing with extraordinary confidence and freedom, he hit all round the wicket with equal strength and certainty, and during an innings which lasted nearly seven hours gave only one chance, and that a very hard one, to Reginald Crawford, who just failed to hold a left-handed catch at short leg. Some idea of the forcing tactics adopted by Hirst may be gathered from the fact that he hit one 6, fifty-three strokes for 4, seven for 3, and twenty for 2. A tremendous and well-deserved ovation greeted the Yorkshireman when he was at last caught in the slips by Crawford. A word of praise is due to Myers, who played for over three hours with wonderful patience, and helped to put on 183 for the seventh wicket.

ON THE GREEN.

TOOGOOD has lately proved himself to be so fine a golfer that it was no mean performance that Thomson, the successor of Braid at Romford, achieved in beating him at Galleywood in Essex the other day by no less than 6 up and 5 to play. This is rather a catchy course, where terrible things may happen to a man who is a little off his game, and probably we may take it that Toogood was just a little off, and that terrible things did befal him. Still, Thomson must have been doing good work.

The accounts of certain matches in the early days of the week in which the amateur international match was played did not read at all pleasantly for the English side, for they represented both Mr. Maxwell and Mr. Graham as playing very strong golf indeed. In a team match of the Royal Liverpool against the Hoylake Village Club Mr. Graham was round Hoylake in a score of 72, which is just a little too low, and though it is possible that the course was not at its full length, one has a measure of the merit of this score in the fact that Mr. Ball was 78, and nobody except Mr. Graham was better than 78 The Royal Liverpool Club won by eight matches to three—by how many holes is not on the record. Then Mr. Maxwell, too, at North Berwick, in a three-ball match with Mr. Laidlay and Mr. Gairdner, was in great form. Both morning and afternoon he beat both the others, Mr. Gairdner beating Mr. Laidlay in the morning, and Mr. Laidlay turning the tables on him in the afternoon. Mr. Maxwell's win, to be sure, was at the expense of compatriot Scots, but still it was terrifying evidence of his form, for he won easily in both matches. The same two tackled him again at Prestwick, but the result was identical. He would not be beaten.

It was fortunate for all would-be amateur champions that the decision of the contest for this championship happened to be on a grassy West Coast green. Even at Prestwick the greens were very dry and keen. I think the selectors of the international teams had hard work on both sides. The rising merit of young players of either nationality compelled them to exclude from the teams one or two who have done well for their respective countries before. As for the arrangement of the order, that Mr. Ball and Mr. Maxwell should meet at the head of either side seemed ordained, but the hand of fate was less kindly emphatic in saving trouble about the order of the two bodies and tails. The final outcome is, of course, matter of history. My own part in the entertainment was restricted, by unkindly rheumatism, to that of a somewhat painfully interested spectator. England suffered severe defeat, by six matches to three, and if the tale of total holes by which she was defeated were to be told it would be a heavy one. Mr. Ball was not in his best driving form. He did well in reducing a lead of four holes that Mr. Maxwell scored in the beginning of the first round to all square at luncheon-time, but in the end Mr. Maxwell won by just 4. Since his recent attack of sciatica Mr. Ball's driving has not been quite right. Mr. Fowler, coming in as first reserve man to take my place against Mr. Graham, unfortunately found the latter at the top of his game, and was very heavily beaten. Mr. Hilton beat Mr. Robb after a good fight, and Mr. Fry, who putted very well on the fast greens, always had the whip-hand of Mr. Laidlay, and won by 5 or 6. Mr. Hutchison and Mr. Pease had a very good match, as they always have. Mr. Hutchison won on the last green, repeating almost exactly the story of the same match in the international last year. Mr. Angus Hambro was not lucky at his first try in this match. He held his opponent, Mr. Edward Blackwell, tightly enough for twelve holes, but then seemed to lose grip of his game, and of his opponent likewise, altogether. In the end Mr. Blackwell won by 9. Mr. Osmund Scott had a very good match with Mr. Harris, a new player in the international, winning by 3 for England. Of all the new men none other justified his choice so fully as Mr. Andrew, a local Prestwick player, who put up a very sound game against Mr. Darwin, and beat him by 7. Of course, he was very much at home, but still, taking all that into account, his play was distinctly deserving of praise. Mr. Worthington, a new English choice, did not do well in his first round against Mr. Dick, and was 7 down at the luncheon interval. Afterwards he stuck to his hard job well, but Mr. Dick finally won by 5 and 3.

So that is the tale retold, and nothing can be said in excuse of a story so sad. England was beaten on her merits. It looks very much as if Scotland was learning to play golf. She has now won two out of three of these international contests, not counting the first not-officially-recognised match at Hoylake, which also was placed to her credit.

POLO NOTES.

THE most interesting event of the week was the determination of the Hurlingham Club, after a thorough discussion of the matter at the annual general meeting on May 20th, to abolish the pigeon-shooting enclosure. Without going into matters which do not concern us here, we can see in this resolution a sign of the progress of polo. It is formally recognised that the game is sufficient to provide entertainment for the members of the club. The additional space which will be obtained by the removal of the enclosure will probably be laid out in croquet lawns. Indeed, the polo at Hurlingham could not be improved except by the addition of a new ground, which is impossible. The existing match ground, in spite of the irregularity of its outline, which has been much improved by the present managers, is a remarkably true ground to play on, and one of our leading players told me last week he liked it quite as well to play on as any ground in London. But with the existing ground the present polo management has done the utmost, and the various tournaments, especially the Social Clubs Cup and the County Polo Association Cup, have grown immensely in popularity and interest. As to the great open tournaments, the Champion Cup and the Inter-regimental, neither has ever been the occasion of more exciting games than during late years. Hurlingham has every prospect now, no longer weighted by the pigeon-shooting, of regaining all its former popularity, and keeping its hold on the respect of polo players at large.

At Roehampton we saw Rugby at its full strength beat Mr. Buckmaster's All-England team—Mr. A. Rawlinson, Mr. F. M. Freake, Mr. Buckmaster, and Mr. P. W. Nickalls. We suppose that this latter team would be the one to meet any combination representing America. But, however that may be, the match revealed to us that the eight players were as level as they could possibly be. There was nothing to choose between them. If anything turned the balance it was Captain Miller's captaincy of his men, but a very little luck might have drawn the game. For three tens there was no score. The backs were absolutely impregnable, in spite of the fact that the forwards on both sides are the best English polo can supply for that position. Rugby by close combination and dexterous passing scored three times before half time; then Mr. Rawlinson got hold of the ball at the critical moment, and twice in succession scored with strokes which illustrated his marvellous power over the ball. If polo players were always at the same level the final victory of Rugby by 3 goals to 2 would seem to mark out that team for this year's championship; but so long as teams are made up of men and horses both subject to change and accident, polo will never lose its interest by becoming a certainty for anyone. The other feature of the afternoon's play was the excellent form shown by the Messrs. de Las Casas, playing for Tiverton. At Ranelagh the Magpies showed a new combination of old soldiers—the Duke of Westminster, Captain L. C. D. Jenner, the Duke of Roxburghe, and Mr. U. O. Thynne. To meet them the Ranelagh polo managers had selected Count de Madre, Mr. J. B. Dale, Mr. F. A. Gill, and Captain S. F. Gosling. This was a galloping game, with the luck and the play on the side of the Ranelagh Club team. The Duke of Westminster, who has a private ground at Eaton to practise on, has come on since last year, but Captain L. C. D. Jenner was the strong man of the team. He is in brilliant form this season. Having always the best of the game, Ranelagh won eventually by 6 goals to 4.

At Hurlingham a Roehampton team—Mr. M. Nickalls, Mr. R. Grenfell, Mr. C. Nickalls, and Mr. C. Grenfell—walked round a club team—Captain Bellville, Mr. W. McCreery, Mr. E. B. Sheppard, and Mr. L. McCreery. Directly the Roehampton men really got together the match was practically over in the first half, and at the last bell Roehampton's score was 9 to 3. A very much finer game was the club team against the Royal Horse Guards, who were playing what is probably their inter-regimental team, viz., Mr. A. Rose, Lord Ingestre, Captain G. J. Fitzgerald, and Captain H. E. Brassey, against Mr. R. Hudson, Mr. F. C. G. Menzies, Lord Harrington, and Major K. Maclaren. Just at first the soldiers had matters all their own way, and got no less than 6 goals to 1 by half time. But then matters changed, and the game, in which the scoring was rapid for a match of this class, became equal with 6 all. However, in the end the R.H.G. made two more goals, and the match closed with the score in their favour at 8 to 6. X.

A WRAP FOR THE DERBY.

Ladies and Gentlemen, take the **a "PORTSMOUTH"** made in **Q** AND —it lies between **a "ROSCUT"**

PURE WOOL WATERPROOF CLOTHS, LIGHT SHADES, INCLUDING OUR NEW SMOKE TAN.

THE "ROSCUT"

WATERPROOF COAT for Ladies.

The superior features of this coat are of such a pronounced character and are so appreciated by those who wear them, that to-day it occupies a unique position in Fashion's realm.

It is distinctly the "correct thing" in Waterproof Attire.

Some idea of its refined appearance may be realized by a glance at our illustrations which are reproduced direct from photographs. It has **ample folds**—is made from pure wool—in light or heavy weights—and is adaptable for "all-the-year-round" wear.

Such advantages as we have before mentioned, however, are not the only good points about "The Roscut." For instance, it is free from odour, and whilst repelling water in a proper manner is

Perfectly porous and forms a most comfortable Wrap.

In quality and workmanship this production is decidedly superior to the ready-made Waterproof Clothing advertised at much higher prices. The illustrations are reproduced direct from photographs.

PRICE FROM **50/-**

THE "PORTSMOUTH"

is an ideal

WATERPROOF COAT for Gentlemen,

and is indispensable to the sportsman. It also has the advantage of the "Roscut" Coat for Ladies: that whilst perfectly waterproof it is porous and a comfortable wrap. We have no hesitation in saying that our "Portsmouth" Coats, made as they are of pure wool, are the best that can be obtained. They can be always used for travelling, in the Motor, riding, shooting in fact, always and for everything outdoor.

PRICE FROM **55/-**

THE "ROSCUT"

WATERPROOF COAT for Ladies.

Only Measurements required: Height Size round Chest, Length of Inside Seam of Sleeve of Coat or Bodice worn. Send, with Cheque, Postal Order, or Notes, and a

"PORTSMOUTH" or "ROSCUT"

will be sent by return, or made and despatched in three days. Do not let inferior articles be imposed upon you by agents for imitators of our goods.

If there is any difficulty about taking the few measures required, go to the nearest firm of Tailors or Dressmakers, direct them to take and send your measurements to us, and we will return them a handsome remuneration for their trouble.

Hall's Sanitary Washable Distemper

Perfection in Distemper

is attained in Hall's Sanitary Washable Distemper, because it is unaffected by light, heat or damp; is washable, does not crack or peel off, and retains its true colour.

Hall's Distemper is the up-to-date wall decoration. It is pleasing to the eye and insures cleanliness. It is, when first applied, a thorough disinfectant and germ destroyer, and appeals alike to the artistic and practical side of house decoration.

The material is sold in tins and iron kegs and only requires water adding to be ready for use. It is of greatest utility for Estates, Farms, Agricultural Buildings, Out-houses, and for most purposes where oil paint is usually applied.

CAUTION.—See name Hall's Distemper on all packages and refuse inferior substitutes.

Sample, shade card and full particulars from Sissons Brothers & Co., Ltd., Hull.
London Office—199B, Boro' High St. S.E.

Hall's Sanitary Distemper is made in two qualities for inside and outside work.

ODDS AND ENDS.

IN view of the great interest that has been aroused lately by articles on Poultry Farming that have appeared in this paper, and also the fact that at this time of the year all the thoughts of owners of shoots turn to the breeding pens, to which their keepers are devoting so much watchfulness and care, the catalogue of "Modern Poultry and Kennel Appliances" of Messrs. Brown and Lilly, Fohney Works, Reading, reaches us in good season. Every variety of house and run is illustrated, and provision is made by this firm for the sanitary housing of dogs, cats, rabbits, and motor-cars, while they also supply all the accessories that long experience has shown to be necessary.

—o—

EXCEPT for old oarsmen and athletes, to whom it will recall periods of training, beef tea has not very pleasant associations, reminding, as it does, most of the rest of us of sick rooms and doctors' orders to feed up; but how invaluable its properties are, and how indispensable, none will deny. The Liebig Company have spared no expense in making the herds of cattle that range their vast farms in Uruguay, Argentina, and Paraguay some of the best in the world by importing stud sires, which, by the way, are chiefly Herefords, the animal which, for the butcher, has hardly a rival in England. How successful their own-bred stock is may be gathered from the fact that they are now selling sires to the States. The company own 1,100 square miles of country, 160,000 head of cattle, and have the world for their market.

—o—

A SHORT time ago we noticed in these columns the system of house cleaning, rapidly becoming familiar to Londoners, by the vacuum process. The Council of the City and Guilds of London Institute have conferred a Fellowship on the inventor of this machine, Mr. H. Cecil Booth, of the firm of Messrs. Hitchins and Booth, civil engineers, of 25, Victoria Street, S.W., in recognition of the engineering work done by him since his association with that body; and householders who have tested the efficacy of his invention will doubtless feel that such a distinction has been well earned and thoroughly deserved.

LATE SEVENTEENTH CENTURY FURNITURE.

THE amateur who collects old furniture will do well to refrain from too wide an ambition. One sees to often an assemblage of objects ranging in date over a matter of centuries, their diverse styles struggling with each other for the mastery, telling no tale as a whole, but failing utterly to arouse any feeling deeper than that of a casual and ephemeral interest. This is especially the case with furniture. He who sets about the pleasant task of gathering together the chairs of his ancestors should enter upon his undertaking in a spirit of reverence, for nothing is more insistent in its demands. Your silver-ware or pewter, your old china or fine brass, may well be loved for their own sakes, in whatever environment you choose to set them up. But let there be one single false note in the furniture of your room, and every item thereof will cry aloud at the incongruity. There seem to be some small differences of opinion as to the name to be applied to that rather clearly-defined style which prevailed in this country during the closing years of the seventeenth century—a pleasant hybrid of old Stuart types modified by the flowing curves of the French ornamentists of the time. "Jacobean" does not serve—it is too vague, and, in its general application, too early. "Queen Anne," that term beloved of the dealer, is too late, and historically incomplete. A nearer approach to accuracy, coupled with convenience, might be attained by the classification of the whole, as "Orange." The foreign influences which produced the characteristics of the period were, of course, at work before the accession of William III.; but that prince had become Stadtholder of Holland in 1672, and married his English consort in 1677, two years earlier than the mention in Elizabeth Throckmorton's Inventory of December 8th, 1679, of "my lady's chamber, 2 cane-bottom chairs, 5s." These high-backed chairs—sometimes upholstered in tapestry, leather, or cane, and sometimes decorated with rich carving, as in the Hon. W. F. B. Massey-Mainwaring's fine examples from the Old Palace, Richmond; or with the more comfortable turned rods in the very interesting example we reproduce—are in themselves a most interesting study. The use of the "intercepted curve" in the ornament dates most of them, and separates them out from the more formal lines and curves of earlier work. The couch shown is interesting, as being almost, though not quite, identical with one illustrated in Miss Singleton's "French and English Furniture," and taken, we believe, from an American collection. The handsome and well-proportioned example of an arm-chair which also accompanies this note, is perhaps as suggestive a specimen as could be found of the possibilities of the style from the utilitarian point of view.

COUCH, QUEEN ANNE.

"HIGH-BACKE CHAIRE," C. 1700.

ARM-CHAIR, LATE SEVENTEENTH CENTURY.

THE GROWING TASTE FOR ENGLISH WORK of the XVIIIth CENTURY.

IT is said that COUNTRY LIFE has been the means of general attention being drawn of the Old and New Worlds to the charm and character of the English home. Twenty-five years ago English Furniture and Works of Art of the XVIIIth Century were only sought by a few amateurs who could appreciate the qualities of the work of that Century, and it is fairly certain that there are still plenty more Works of Art at present unrecognised, which will be the backbone of the Art dealers' fortune of twenty-five years hence—works at present waiting for a man of discernment and power to lift into popularity.

A very fine example of Work of about 1740 to 1750, at 15, George Street, Hanover Square, W.

Books and facilities in travelling have led to a general improvement in taste. At first a decided tendency for French styles of furniture and decoration prevailed, but at last the English work from 1700 to 1800 has taken a firm hold of the public, and it is remarkable to observe this special development in America. Some of the finest houses, both in the Cities and country, are being reproduced from old Georgian mansions, even the gardens being in many cases faithfully reproduced from COUNTRY LIFE.

A remarkable example showing the influence of Italian Art upon the English designer; a very rare example from Mr. Allom's collection of models at George Street.

We illustrate here a few fine Georgian examples of mirrors from the collection made by Messrs. White, Allom & Co., of London (designers of many of these homes), and from which their carvers work.

The taste for things of this type has so enhanced their value that our Museums are curiously devoid of Works of this period, and the necessity of training workmen to carry out this work has led Mr. Allom to make quite a unique collection to keep his designers and craftsmen up to the mark in carrying out the restoration of old, or decorations of the modern mansions in the old style.

It is well known how many Country Mansions have of late years been destroyed by fire, some of which were fine examples of early XVIIIth Century Architecture, and it is therefore not surprising that there is a strong desire on the part of the wealthier classes, both in this Country and America, to reproduce the work of this period, the originals of which are yearly becoming more scarce.

A refined example of Mirror of about 17 5. Bought 15 years ago for £13, sold 10 years ago for £30, and recently bought for £80, showing the rise in value. Ten years more will probably see this Work worth £200.

This Example is typical of the architectural influence upon the designs of the Georgian period.

In a later number it is hoped that some interesting examples of modern American homes, and the models made for them, may be illustrated, showing how faithfully the character of the old work has been reproduced, and how the many fine pictures and other Works of Art which leave this country, are housed on the other side of the Atlantic [advt.].

MODES AND MOODS

VOILE seems to be even more popular than ever this year, and no wonder, for it is not only beautiful in its variety of colourings, but it is exceptionally serviceable in its wearing qualities. Beer, in Paris, has taken voile specially under his wing this year, and all his smartest afternoon dresses are made in this charming material. I am, therefore, opening my remarks this week by an object-lesson in voile given by the accompanying illustration, which should serve to give ideas to those ordering their summer dresses at present. The skirt is of the most recent umbrella shape, close-fitting round the hips, but immensely full at the hem. Beer puts unmistakable steels in the hem of these very wide dresses, to keep them out round the feet; and this has given rise to a crinoline scare, and the revival of that absurdity, the "Anti-Crinoline League," as if a woman could not decline to wear a crinoline without being bolstered up by a "League" behind her! But even Beer's steels are too apparent, and they give also an ungraceful "wobble" to the skirt as the wearer moves, so I doubt if they will be much accepted; and it is wiser to keep to the heavy piping cords a little above the hem in the under-skirt which Doucet and Laferrière brought out last winter. These keep out the fulness of the skirt quite sufficiently without destroying the grace of outline. The dress in the illustration is of Saxe blue voile; and the skirt is trimmed with two rows of festoons made of gaugings and quillings of the dress material. The same idea is repeated in the very quaint and original little bodice. It is cut very full, but all the fulness is held to the figure at the waist by lines of gaugings on thick cords, which form a corselet belt that rises to a point under the arms and descends low in front. Below the corselet the fulness again escapes in the shape of two frills, kilted flatly so as not to give an untidy appearance, which have a quaint basque effect which is very striking. Similar little kilted frills form a kind of collar on the shoulders, over which are turned collar-like revers of white canvas embroidered with large spots in mauve silk. The transparent vest is of white muslin and lace; and the lace is brought outside at the bust and falls in two long scarves, held in place by two bows of mauve satin ribbon, a bow of which also gives a note of colour at the throat. The sleeves are complicated, as most of this season's sleeves are. They begin with a full puff of the voile, on which appears a festoon of frills and gauging, repeating the trimming on the skirt; the puff ends in a deep-pointed cuff of voile edged with a frill, which again is merged in a narrower pointed cuff of white canvas with mauve silk spots to make the revers, and tiny lace frills terminate the whole sleeve, which only reaches just below the elbow. The hat to match this very dainty gown is in pale blue crinoline, the crown covered with a mass of lilac, which harmonises most delightfully with the whole costume. *Apropos* of the corselet effect of the gaugings on this voile dress, I noticed that all the smartest corselets at the big Paris dressmakers ran up in points under the arms and down very low in front; and certainly nothing could be more becoming to the figure, as this greater height of the belt under the arms made the waist look delightfully round and small.

ORIGINAL DESIGN FOR A SUMMER DRESS.

To return for a moment to the question of voile dresses, there was a detail in connection with them that I saw in Paris which

I think is worth mentioning. Many of them were made up over white silk, but to prevent the somewhat thin effect which the skirt thus treated would present, the white silk was covered all round the hem by a deep band of silk the colour of the overdress of voile, ending in deep upstanding points. For instance, a dress of deep blue voile over white silk had the under-skirt thus treated with deep blue silk for almost half its height, and the effect of this intensifying of the colour round the feet, and the rising points of blue on the white silk under the flowing blue voile skirt, gave a graduation of tint which was both charming and original. There was no need for much trimming on the voile skirt when the silk skirt underneath was thus treated, and I thought the idea was a most happy novelty.

SIMPLE COTTON FROCK

Cloth is very much used as the trimming of these voile dresses, stitched bands or "straps," as the French prefer to call them, being the most popular form. These straps look particularly well when used to cover the puffs, from shoulder to elbow, of the voile sleeves, which show through as the straps fall apart. These cloth trimmings are always of the same colour as the material of the dress, and are very effective, as well as a good deal more lasting than most forms of trimming on summer dresses. But voile, though immensely attractive in its great variety of colour and design, is not the only attractive material for summer frocks with which we are blessed this year. Even more appropriate for morning wear are the charming cottons, which have never been so pretty or so daintily varied in design as this season. One used to think of a linen or cotton frock as a thing to wear a few times, and then send to the cleaner or the laundress; and consequently they were made as plain as possible, with this necessity in view. But these present-day cottons are hardly to be distinguished from foulards or voile; and one of them, of a well-chosen design and colour, will do yeoman service through the summer months without needing to pay a single visit to the cleaner. There are the most charming varieties of the ever-popular checks, both large and small, in dark tones, such as navy blue, violet, and deep reds, which would make delightfully useful, ornamental, cool, and effective frocks for morning wear; and other designs with spots or flowers are also greatly to be admired. I am giving a sketch of one of these attractive cotton frocks on this page, to show how well they deserve the affection which I feel for these inexpensive and useful dresses. The one sketched is of a lilac and white plaid, which is a pleasant variety of the check, and looks particularly well in cotton. The skirt is plain, and cut in gores, each gore, as it widens out in folds around the feet, being marked by a band and upstanding point in lilac cotton, ornamented with tiny mother-o'-pearl buttons. The bodice is made with some shallow pleats to give an easy fulness both in front and at the back, the two centre pleats in front being left loose to give a bolero effect and a prolongation of line, the ends being finished with little kilted frills of lawn. Round the shoulders is a kind of shaped yoke of lilac cotton, edged with the kilted lawn frills, ornamented with pearl buttons which continue in a double line down the fronts. Above is a chemisette of white broderie Anglaise, finished with a tiny knot of black satin at the neck. Two puffed sleeves end in a cuff and point of lilac cotton outlined with the kilted lawn, several frills of which finish off the sleeve at the elbow. A wide rucked belt of soft mauve leather, drawn through a big silver buckle low in front, completes this most charming and dainty little frock. The mousselines de laine (abbreviated generally as delaines) are lovelier than ever this year, and are most excellent summer wear, for they are nearly as cool as muslins, and, at the same time, do not crush as do those charming fabrics. The Louis XV. designs in delaine are really beautiful, and, if made up with innumerable frills of narrow Valenciennes, make most effective dresses for afternoon wear. Often these frills outline a design carried out in arabesques of silk padded with cotton-wool, which are immensely effective, and yet can easily be carried out even by the home dressmaker. The taffetas is cut on the bias in narrow bands, which are stitched round the thin rolls of cotton-wool, and, once these worm-like lengths are made, they can be disposed on the dress in circles, or festoons, or the Greek key pattern (the last-named design being particularly popular in Paris this season, both for day and evening dresses) as desired. Of course the wadded worm must be neatly made, but any little deficiencies are easily hidden by the outlining frills of narrow Valenciennes, and the final effect is extremely rich and decorative.

Another delightful novelty in the way of summer materials is the new voile de soie, which has a sheen denied to the woollen voile, and a substance not to be found in chiffon. This material makes the most lovely dresses for afternoon and race wear; in fact, it is likely to oust chiffon altogether for every form of daylight wear, though chiffon and mousseline de soie will continue to hold their own at night.

The cold snap which has been such a recent infliction has tried many a delicate skin; and more than ever at this time of year, when these sudden changes of temperature are inflicted upon us, is it necessary to be regular in the use of Dr. Dys's invaluable Sachets de Toilette and Sève Dermale. Nothing will guarantee the preservation of a velvety skin and rose-leaf complexion like

the daily and nightly use of one of these sachets squeezed out in a basin of warm water to which a tablespoonful of the Sève Dermale has been added. The Sève Dermale penetrates the tissues and braces them up with its tonic properties, while the milky lotion of the crushed flowers and tropical seeds in the sachets makes the skin soft and velvety, removing all redness and roughness caused by winds or sudden changes of temperature. No woman's dressing-room is complete without these two invaluable toilet articles, which can be procured from Dr. Dys's sole agent, V. Darsy, 54, Faubourg St. Honoré, Paris.

It is not only, alas! our complexions which suffer from the untimely cold and sudden drops of the thermometer, though that is sufficiently disastrous, but if the skin gets chilled, as it is so apt to do, then serious illness may well result. The best way to provide against this is by adopting proper underwear, and there is none better than that of Dr. Rasurel. His hygienic stockinet materials, which are made of pure natural wool and peat, have the great advantage of being warm without being heavy, and as they keep the body always dry, they prevent chills and their fateful consequences, and ensure the healthy action of the skin. They are very soft, elastic, absolutely unshrinkable, and free from dye, and are not subjected to any treatment which might be injurious to the health of the wearer, which is a very important point. This admirable kind of underwear can be obtained from H. Clauzier, 105, Wood Street, E.C., or at Messrs. Doré and Sons' establishments in the City and West End.

The summer is here, and so are white shoes of all kinds, whether for tennis, yachting, or smart feminine wear with light-coloured dresses; and those who adopt this cool and comfortable form of footgear will be glad to know of Messrs. E. Brown and Son's "Parian White," which is invaluable for cleaning all kinds of white boots and shoes, belts, gloves, etc. For feminine use it is particularly recommended, for the ordinary whiting or pipe-clay has the bad drawback of coming off on the hem of the skirt and petticoats; whereas Parian White does not rub off, and shoes cleaned therewith can be worn with dark-coloured dresses, such as blue serge yachting costumes, without causing injury thereto. It can be used for white buckskin, kid, or canvas; and it fully deserves its share of the gold medal which was awarded to Messrs. E. Brown and Son at the Indian Exhibition in London for the excellence of their various preparations. Messrs. Brown, who also manufacture the famous Miltonian Blacking, have their manufactory at 7, Garrick Street, W.C., while their French depôt is at 26, Rue Bergère, Paris.

The annual summer sale of the Royal School of Art Needlework in Exhibition Road, South Kensington, is an event which is looked forward to by many people desirous of obtaining some of the beautiful objects which are therein set out for sale at remarkably moderate prices, considering the exquisite quality of the work and the artistic merit of the designs. This year the sale will take place on Monday, Tuesday, and Wednesday, June 5th, 6th, and 7th, and Her Royal Highness Princess Christian, as president of the school, will open and preside over the exhibition. The school has carried on a very fine work for many years, and thoroughly deserves the warm support of the public. LAMIA.

MONGOLIAN PHEASANTS IN KENT.

WE wonder if our English pheasants share the Kaiser's fears about the "Yellow Peril"? Because they are evidently about to undergo an invasion from Mongolia by the pheasants of that ancient land. Mr. C. E. M. Russell, a retired Indian Forest Officer, has had a happy thought for the employment of some of his spare energy in retirement. The importation of some three or four splendid varieties of pheasants from the Far East, as to the desirability of obtaining which for our coverts everyone is agreed, has "hung fire" for some years, though why it has done so, with an eager demand existing for them here, it is difficult to say. Reeve's pheasant, the most striking, and far the largest of the family, was obtained in considerable numbers, and given a fair trial, with the result that it was acclimatised here successfully enough. But this pheasant has not answered expectation as a sporting

bird. It runs in preference to flying, flies low on ordinary ground, and, besides that, it wanders far and fights desperately in the spring. Then Mr. Walter Rothschild obtained enough pure Mongolian pheasants to make a reliable trial of them in the coverts at Tring. Writing in a contemporary on June 20th, 1903, he said: "I have had a number of the true Mongolian pheasants alive at Tring for two or three years, both pure and half-bred, hatched and reared in our coverts, and those which were shot proved much superior in flavour and size to ordinary pheasants. Cock birds hatched in June were as full plumaged and weighed as much as two year old common pheasants."

About this time Colonel Marsden Sunderland was successfully rearing another beautiful variety from South-Western Central Asia, the Prince of Wales's pheasant, from the region of the Murghab River on the North-Western Frontier of Afghanistan. How he went out himself to the East to get the eggs, and the manner in which they were reared, first at Conholt Park in Hampshire, and now at Findon near Worthing, were described in COUNTRY LIFE of May 20th last.

The Mongolian variety is probably the largest of all the true pheasants next after Reeve's; but unlike that gorgeous creature it belongs obviously and closely to the breed which we call the common pheasant, of which Hagenbeck's pheasant, the Prince of Wales's, the true Chinese pheasant (P. torquatus), the Yarkand pheasant, and the Japanese pheasant with the green breast are all modifications. It is rather of the type of the Chinese pheasant, but is much larger, and has shoulders almost white, and a very broad white collar, interrupted in front, as if someone had put a strap across to hang a locket by, and then forgotten the locket. It is a very bulky bird, with a splash of green down the centre of the breast. Elsewhere the general colour is a magnificent deep ruby claret tint, though the iridescence of the feathers makes it impossible to describe the colouring accurately in the same way as can be done in speaking of fixed hues. But the foregoing will perhaps be enough to show that it is a very fine bird.

Mr. Tegetmeier, writing of later results at Tring, says: "It is very satisfactory to know that the half-bred Mongolian birds have proved successful in the coverts.

THE DRINKING PAN.

Several hundreds were reared and came to the gun in 1903. The male hybrids have much the appearance of the pure Mongolian, though the wing coverts are not so clear or white. But in beauty, hardihood, and qualities on the table they leave nothing to be desired." Mr. Russell quotes Mr. Rothschild's opinion that they are also better fliers than the common pheasant, and show no greater tendency to stray. The Far Eastern region from which they come has also a very cold climate in winter, when frost and snow prevail for months. In summer it is very hot. So the birds, used for ages to these violent changes, are reputed very hardy.

It certainly seems so from the story of Mr. Russell's experiments. He first tried to get the stock from an English firm which advertised them and professed to get them from Hungary—though why from Hungary passes understanding. "Miserable mongrels were supplied, for which, however, a high price had been asked, and these, after their inspection by an expert, were at once returned, the firm advertising afterwards stating that pure Mongolians were not obtainable on the Continent." By this we understand Mr. Russell to mean "not from coverts on the Continent," for he

A HANDSOME FAMILY.

ultimately got his birds from Mr. Carl Hagenbeck of Hamburg, the Moltke of wild-beast importers, who has hunters and catchers of all kinds constantly at work in the Far East, and, among other things, caught and brought to Europe those forty wild horses from the deserts of Dsungaria of which the Duke of Bedford purchased several which were lent to the London Zoo. Mr. Hagenbeck had previously obtained Mr. Rothschild's birds for him. They were costly, but the real article. Most were cocks, but a few hens arrived late in the season, and naturally much the worse for their journey of 6,000 miles. Yet they all lived, and two of them laid a few late eggs. From these, very late—between July 14th and August 4th—fourteen chicks, of which nine were hens and five cocks, were hatched, and every bird was successfully reared. This is one indication of how hardy the chicks are. Another is that a good many half-bred Mongolians have been reared at the Zoo, on the very unfavourable and stale ground there. Subsequently Mr. Russell obtained another set of cocks from Mr. Hagenbeck. The advantages claimed for the Mongolian may be summed up as consisting in hardihood, strong flight, size, early maturity, beauty, and edible qualities.

AT AN EARLY BREAKFAST.

Naturally there is always a tendency to think rather too highly of any new and promising bird. But so far we are bound to say that we have not heard a word against any of these claims. Mr. Russell's Mongolians and hybrids are very well worth going to see. They are at Hempton Lodge, near Hythe, and about a mile and a-half from Westenhanger Station.

The following short table of results shows that the stock will soon be large and really useful:

Hens imported	6
Hatched late last year ...	9
	15
First egg, 1905 (from one of the young hens), April 22nd.	
Total of eggs from fifteen hens to end of April	34
During first week of May ...	67
Thence to May 21st	168
	269

Two hundred and forty-one pure Mongolian eggs were set under hens, the first due to hatch on May 23rd, and by May 22nd many were already chipped. Several of the healthy little chicks are here shown, which every sportsman will hope may prosper. But Mr. Russell also aims at supplying a large number of half-bred eggs from common English hens crossed by the Mongolian cocks. These birds are perfectly fertile, either with other hybrids or with the English or the ring-necked pheasants. The bringing in of new birds for sport and the table is no new thing. Farmyard and covert have many such. Yet one may remark, that whilst we gain birds we lose our beasts. Setting aside the sabre-tooth and the cave-bear of geologists, England has lost, besides lesser beasts, her wolf and her beaver; and the coming of the brown rat is balanced by the loss of our own black rat. Elands and kangaroos find good browsing in certain parks, but the sportsman neither stalks the one nor rides after the other. Macaulay's New Zealander, if he bring his Z-ray gun with him, must be content to find his game on the wing.

BRITISH ELIMINATING TRIALS.

[By Telegram from Our Special Correspondent.]

THE contest for the honour of representing England in the great Gordon Bennett Cup Race has been fought and won, and with what must be conceded to be somewhat unexpected and disappointing results alike. Nevertheless, it produced an eventful and exciting race, and no one knew until the actual finish who would prove to be the winners. That it was an open event had been generally recognised; but during the race itself no one could predict with any confidence the ultimate issue, so closely were several of the competitors pressing upon each other's heels, and so completely were the popular expectations discounted by unlooked-for failures and mishaps on the part of those who, if anything, were favourites in advance. In one sense, it is improper to refer to the event as a race at all—it was rather an eight-hours' high-speed reliability trial, in which various factors besides the mere order of finishing had to be taken into account. The cars, for example, were timed for speed over two sections, of two and a-half miles and half a mile respectively; their hill-climbing capabilities were also noted, as well as their powers of quick acceleration from a stationary position. Their brake efficiency was also a matter for consideration, as also were their condition after the trial and the skill of their respective drivers. All these factors left a loophole for the Trials Committee, which would enable them to select as the best a car which might seem the most suitable to represent this country with credit in the actual Cup Race itself on July 5th next, but which, nevertheless, owing to a temporary failure of one kind or another, due to the luck of the moment, might not finish within the first three. It is unfortunate, therefore, as events have proved, that, even with all these safeguards, one car at least which every expert would regard as the most likely to sustain the British colours with success on the Auvergne Circuit was unable to do itself anything approaching justice or qualify for the coveted representation in the big race. With every car, perhaps, but one there was ample room for possible surprises, but no one thought that the six-cylinder Napier, driven by Arthur Macdonald, would fail to make at least a good show, while it was confidently expected to prove superior to its rivals in almost every particular. The car in question had only three or four months ago annexed a sheaf of world's records at Ormond Beach, in Florida, and though there is no comparison between a kilomètre sprint on the flat and an eight hours' trial on a hilly course, the fact remains that a car of such power, and with a peculiar suppleness, due to the employment of a six-cylinder motor, possessed extraordinary advantages over the Isle of Man course, which is full of awkward, not to say dangerous, corners, at which it is necessary to slow down to a crawl and then pick up speed as rapidly as possible after getting round the bend. That the six-cylinder car had in this respect decided advantage was incontestable, and it is much to be regretted that the fortunes of the day went all against the undoubted favourite. The course was identical with that of last year, being a little more than fifty-one miles in length, with four controls and a compulsory stop and start at the awful corner and level crossing at Foxdale. So dangerous was the latter that even the ordinary slowing down at the discretion of the drivers was felt to be insufficient. The four controls absorbed 11min. of time on each round.

The cars were started at 5min. intervals, as was the case last year, and the whole of the entrants duly presented themselves at the starting-point, Quarter Bridge, outside Douglas, at nine o'clock. The full list of competitors is as follows:

No.	Car.	Entered by	Driver.
1	Star ...	Sir A. Hickman	H. G. Goodwin
2	Star ...	E. Lisle	F. R. Goodwin
3	Darracq	A. L. Guinness	A. L. Guinness
4	Wolseley	H. Austin ...	C. Bianchi
6	Napier	S. F. Edge	Cecil Edge
7	Napier	S. F. Edge	C. Earp
9	Napier	J. Hargreaves	J. Hargreaves
10	Siddeley	J. D. Siddeley	S. Girling
11	Wolseley	H. Austin ...	Hon. C. S. Rolls
12	Napier	S. F. Edge	A. Macdonald

In order to avoid confusion the numbers five and eight were not apportioned. As each car was sped on its way by Major Lindsay-Lloyd, its powers of acceleration were eagerly observed, in order to afford some measure of its speed and chances on the tortuous course. Timed to a given point, the Stars took 23 1-5sec. and 23sec. respectively, and then the Darracq got splendidly away in 18sec. Bianchi and Cecil Edge each did 1-5sec. better, and then Earp equalled Guinness. Hargreaves took 21 3-5sec., Girling on the dark horse, the Siddeley, 2sec. more, and then came Rolls with 19 1-5sec. Macdonald, however, leapt into his stride in magnificent fashion, and reached the distance point in 15 3-5sec., thus justifying at the outset the hopes of his partisans and admirers. As I have already hinted, however, the fates had other sequences in prospect. Even the first round finished with unlooked-for results. Cecil Edge made the fastest time, namely, 1hr. 16min., and the performances of the other competitors were as follows: Guinness, 1hr. 19min.; Bianchi, 1hr. 20min.; Earp, Girling, and Rolls, each 1hr. 24min.; H. G. Goodwin, 1hr. 31min.; Macdonald, 1hr. 35½min.; Hargreaves, 1hr. 37min.; and F. R. Goodwin, 1hr. 53min. Macdonald had been slowed by the losing of a pump-chain, Hargreaves had had to change his plugs, F. R. Goodwin had defective water cooling, and not a solitary one of these first-round records adequately represented the true qualities of the car concerned. The second round was more or less disastrous. Guinness retired outright owing to the breaking of a piston connecting-rod, Macdonald took 3hr. 5min. because of a twisted gear-shaft, and had been given up for good when he finally turned up at Quarter Bridge, and Girling came to grief three miles short of Ramsey owing to the breaking of his steering-gear. He collided with a house, and both he and his mechanic were thrown out; the latter was unhurt, but Girling was somewhat shaken, and sustained damage to a finger. Cecil Edge had coil troubles, and took 2hr. 11½min. On the other hand, Earp did the fastest run of the day, namely, 1hr. 8½min.

The third round produced one more elimination, that of

AT QUARTER BRIDGE.

A Wolseley, starting on its first round.

MERCÉDÈS

"His Majesty the King has recently added to his motor car stud one of the latest creations of the Cannstatt firm, viz., a 40-h.p. Mercédès. The new Royal Car is being housed at Buckingham Palace, and is mainly intended for travelling between London and Sandringham."—*Daily Paper.*

LEVASSOR.

A REMARKABLE HILL-CLIMBING TEST.

The following extract from "The Bristol Daily Mercury," of March 20, shows what a

Four-Cylinder Humber

WILL DO.

"The hill climbing capabilities of a Humber 16-20 h.p. motor car were satisfactorily tested on Saturday morning, when it ascended from Stokes Croft up precipitous Thomas Street to Freemantle Square, to the surprise and admiration of a number of spectators who happened to be in the locality just before noon. This is how the ascent was made. The car, having been brought to a standing position at the bottom of Thomas Street, was set in motion, and at a rate of about twelve miles an hour reached the point where the even gradient of the hill is abruptly broken by a short and steep incline, that is, about half-way up. Here a stoppage was made, and then the car resumed its course, accomplishing the most difficult part of the run at about ten or twelve miles an hour. There must be a deal of reserved power in a car that can be re-started from such a position. Its four occupants kept their seats throughout the journey. The Humber runs very quietly and smoothly, and the 'flexibility' of the engines is a great advantage The car has climbed several noted hills, including Dundry Hill, Blue Bowl Hill (Wells), East Harptree Hill, Blagdon Hill, and the Cheddar Gorge. It was brought to Bristol to be tested in steep Thomas Street, the gradient of which shows an average of one in four."

The 16-20 h.p. four-cylinder Beeston Humber Car made a non-stop record throughout the Scottish Reliability Trial. See reports for complete details of its splendid performance.

THE HAIRPIN CORNER.
Earp making a clever turn.

Macdonald. It appears that outside Ramsey he was making all speed between the town and the foot of Snaefell when he struck a rough place in the road with such force as to cause the car to leap bodily into the air. As he alighted he struck the bank, and, having buckled his near-side front wheel, abandoned the contest. Hargreaves had protracted puncture troubles on this round, and had also screwed his clutch too tight. His time was 2hr. 49min. Rolls made the best round in 1hr. 17½min. The issue now appeared to be between Earp and Bianchi for leading place, with Rolls and H. G. Goodwin to contest the third. Various as had been the failures, the leaders were eclipsing the records of the previous year, and six rounds might be completed by two and perhaps three of the cars, whereas last year none did more than five. There was again a hot struggle for premier honours between Bianchi and Earp on the fifth round, which was completed by the former in 1hr. 14½min., and by the latter in 15sec. less. Rolls came by in 1hr. 26½min., while Goodwin did not finish. To the last Bianchi and Earp fought out the issue, the Wolseley taking 1hr. 25min., and the Napier 1hr. 21½min. Rolls, on completing his fifth round, was not allowed to start a sixth, as he could not have covered the ground before finishing-time. Earp's time totalled 7hr. 52¾min. for the six rounds, and that of Bianchi 7hr. 58¼min. It must be pointed out, however, that these figures represent the net running times between controls, and that no allowance is made for deductions in controls for adjustments or repairs. It is a curious fact that the cars driven by these three were all last year's vehicles, altered and tuned up, and the failure of the newer types is much to be regretted. At the same time, it must be conceded that the experience is by no means new, and it may be particularly remembered that the Gordon Bennett race of 1903 in Ireland was won by an old car.

The following official statement has been issued by the races committee: "Cars and drivers selected to represent the Automobile Club of Great Britain and Ireland in the Gordon Bennett Cup: First, Earp, No. 7, Napier; second, Rolls, No. 11, Wolseley; third, Bianchi, No. 4, Wolseley. Reserve: First, C. Edge, No. 6, Napier; second, J. Hargreaves, No. 9, Napier." It will, therefore, be seen that a detailed examination of the control sheets and timekeepers' records has put a better complexion upon the performance of Rolls, and entitled him to second place in the team instead of third.

AWARDS IN THE SCOTTISH TRIALS.

WITH commendable promptitude, the Scottish Automobile Club has issued its report on its recent trials. It will be remembered that, by the rules, if two or more cars obtained full marks for reliability, the awards were to be decided by the results of the timed hill-climbs as worked out by the club's formula. In Class A, for single-cylinder cars, the gold medal goes to the 6 h.p. light Wolseley, thus adding another prize to the long list of successes achieved by this firm in events of this description. Non-stop certificates are granted to the 8 h.p. De Dion and the 9 h.p. Cadillac, which tied with the Wolseley in the matter of reliability, but gained fewer marks for hill-climbing.

In Class B, for two-cylinder vehicles, the gold medal is awarded to the 16 h.p. Albion, which was the only car to achieve four non-stops. But for the loss of 1min. owing to the sticking of the throttle-valve spindle, the prize would have gone to the 12 h.p. Wolseley, which gained by a large margin the highest marks for hill-climbing in the class. Good hill-climbing marks were also obtained by the 12 h.p. Arrol Johnston, to which is awarded the Glasgow Cup for the car which showed the most economical results in petrol consumption of all the cars which took part in the trials.

In the three and four cylinder class the 20—25 h.p. Ariel obtains the gold medal, and the 24—32 h.p. Mors the silver medal, while non-stop certificates are granted to the 16—20 h.p. Beeston Humber, 24 h.p. Germain, 24 h.p. Thornycroft, 12—16 h.p. Richard Brasier, 30—40 h.p. Belsize, 15—20 h.p. Brooke, 20 h.p. Vinot and Dequingaud, 12—14 h.p. Gladiator, and the 12—14 h.p. Argyll. As we recorded at the time, the fastest speed in the hill-climbs was accomplished by the Mors, but the Ariel, which was only a few seconds slower, is awarded first place on the formula which takes into account the weight and petrol consumption of the cars. We hope next week to give the hill-climbing marks in full.

Wokingham, the home of Mrs. Walter, who is a member of the committee. We reproduce a photograph taken during the afternoon, which, however, is hardly representative of the gathering, as many of the cars had previously left on the return journey. Among others present were Sir Henry and Lady Colville, Lady Geraldine St. Laurence, Mrs. Henry Edmunds, the Duke of Newcastle, Miss d'Esterre-Hughes, Mrs. Herbert Lloyd, Captain and Mrs.

J. W. Debenham. *A MEET OF THE LADIES' AUTOMOBILE CLUB.* Copyright

Last week some sixty members and friends drove down to Bear Wood, Wokingham, the home of Mrs. Walter.

Deasy, Lady Manson, Mrs. Buttemer, Mrs. Manville, Miss Pilcher, and the Count Moore. Numerous meets have been arranged for the summer months, including June 7th, at Battersea Park, at 3.30 p.m.; June 28th, at Lightwater, Bagshot, by invitation of Lady Colville; June 30th, first day of run to France for the Gordon Bennett race; July 1st, Gymkhana at Ranelagh; July 8th, at Charlwood Park, by invitation of Mrs. Campbell.

SOME WHITSUNTIDE MEETINGS.

The particulars are announced of two important competitions which will be held on Saturday, June 10th, and Monday, June 12th respectively. The first is the South Harting Hill-climb, organised by the Automobile Club of Great Britain and Ireland and the Sussex Automobile Club. The course, which is a mile in length, is about $3\frac{3}{4}$ miles from Petersfield and nine from Liphook. Entries are confined to fully-equipped touring cars, which will be required to carry their full complement of passengers. There will be three classes—for vehicles costing £150 and not more than £350; for cars the chassis price of which is £300 and not more than £500; and for cars the chassis price of which is over £500 and not more than £850. A cup and the club's silver medal are offered in each class, and in addition the club's gold medal will be given for the best performance, irrespective of class, on a handicap by the club's formula. The second event is the Yorkshire Automobile Club's speed trials on the Filey and Muston Sands, which will take place on Whit-Monday. The course will be about $1\frac{1}{2}$ miles in length, and the sands are said to offer a splendid surface for racing. A very full programme has been arranged, including open and restricted events for both touring and racing cars, and some valuable prizes have been offered, including a 40-guinea cup by the *Sheffield Daily Telegraph*, and a 50-guinea cup by Mr. H. R. Kirk. The following is a diary of the principal fixtures for Whitsuntide:

Thursday, June 8th.—Lincolnshire A.C., Market Rasen, Hill Climb.
Saturday, June 10th.—A.C. Hill Climb, South Harting Hill (near Petersfield).
Monday, June 12th.—Yorkshire A.C., Speed Trials on the Filey and Muston Sands.
Wednesday, June 14th.—Bexhill Race Meeting.

times made by Arthur Macdonald on the 96 h.p. Napier at Ormond Beach, January 28th to February 3rd. They are as follows: 1 mile, 34 2-5sec.; 5 miles, 3min. 17sec.; 10 miles, 6min. 15sec.; 20 miles, 15min. 23sec.; 1 kilomètre (slow start), 27 3-5sec; 1 kilomètre (flying start) 23sec.

MOTOR IMPORTS.

The trade returns for the first four months of the present year, relating to the imports of motor-cars and motor-cycles into this country, are summarised in the table given below. It will be seen that the total automobile imports for that period show an increase in value of no less than £329,646 over the previous year, although the actual number of cars declined from 1,924 to 1,897. Motor-cycles, on the other hand, increased in number from 457 to 503. The most startling increase, however, is in the value of the motor-car parts imported separately, which has risen from £91,885 in the first four months of 1904 to £237,735 in the present year up to the end of April last. These figures would seem to indicate that our foreign rivals are devoting their chief energies to the more expensive types of automobile, while taking a share in the small-car trade in this country by supplying component parts, such as engines and gears, to the manufacturers.

THE SIDDELEY-MEYAN MATCH.

The determination of Mr. Siddeley to bring the proposed match between himself and M. Paul Meyan to an issue is well proved by the willingness he has shown to accept every condition put forward by M. Meyan. Mr. Siddeley was anxious that the match should be conducted under rules similar to those which are usual in reliability trials in this country. M. Meyan, on the other hand, insisted on a free-and-easy sort of tour, in which the only check on the competitors should be the division of the daily runs into stages of a certain length, which must be covered in a certain maximum time. To this Mr. Siddeley has consented. The times will be checked by control officials, and no observers will be carried on the cars. It is even doubtful whether the cars will be locked up at the conclusion of each day's run, it merely being left to each competitor's honour to see that no repairs are effected during the night. Mr. Siddeley will drive an 18 h.p. Siddeley of last year's pattern, and M. Meyan his 24 h.p. De Diétrich, both of which cars have done many thousand miles of hard work. The 3,105-mile route which has been agreed upon will take the two competitors completely round France. From Paris they will travel eastwards to Nancy, thence southwards to Nice, on to Bordeaux in the West, thence along the coast to Boulogne, and back through Nancy to Paris.

THE STEWARDS OF THE AUTOMOBILE CLUB.

In accordance with the competition rules of the Automobile Club, by which the final decision of all disputes rests with the stewards, the following gentlemen were recently appointed to the post at a meeting of the council held for that purpose: The Duke of Sutherland, K.G., the Earl of Dudley, the Earl of Onslow, Earl Russell, Lord Stanley, M.P., the Hon. Arthur Stanley, M.P., Sir David Salomons, Bart., Sir J. H. A. Macdonald, K.C.B., Colonel H. C. L. Holden, R.A., F.R.S., Lieutenant-Colonel Mark Mayhew, Mr. W. G. D. Goff, and Mr. Charles Hardy.

ITEMS.

We have received an illustrated pamphlet describing the Crossley Petrol Landaulette, which is designed for town and country use. The pamphlet may be obtained from the agents, Messrs. Jarrott and Letts, 45, Great Marlborough Street.

One puncture per 1,000 miles is generally considered an excellent average for a car of medium weight over ordinary roads. The Rev. R. H. Simpson of Spilsby, however, has nearly trebled this distance without any of the vexatious delays which often bring discredit on pneumatics, as he has written to the Dunlop Company to state that it was not until he had run 2,800 miles on his Dunlop-tyred Vauxhall that he experienced his first puncture.

The Daimler Company has scored a string of successes in public competitions during the past week or two. At the American Automobile Club's races at Brighton Beach, Coney Island, U.S.A., a 30 h.p. Daimler was the winner of event No. 1 and secured second place in event No. 4. In the Scottish Trials a 30 h.p. Daimler made the fastest time in the Glenshee hill-climb; and at the Cultra hill-climb of the Royal North of Ireland Yacht Club the best time was again made by a 30 h.p. Daimler, an 18 h.p. car of the same make being second.

The entries for the Tourist Trophy Race now number fifty-four, the latest additions to the list being a Germain, a Royal Enfield, and a Renault.

THE 'WESTBURY' COAT.

Specially adapted for SHOOTING, GOLFING, OR FISHING.

Invaluable to Sportsmen. Rainproof without Rubber. Is cut on a principle registered by us; gives complete freedom and ease in every position, is well-fitting and smart in appearance, and extremely comfortable.

Photographed from Life.

Gen. Sir FREDERICK CARRINGTON, K.C.B., K.C.M.G., writes us:—
"I consider the Westbury Shooting Suit you made me quite the most comfortable I have ever had. I think the coat is admirable."

Mr. WILLIE PARK writes:—
"THE WESTBURY GOLFING COAT you made for me is by far the most comfortable I have ever worn."

Mr. JAMES BRAID (open Champion, 1901), writes:—
"THE WESTBURY GOLF COAT you made me allows absolute freedom to the arms when swinging, and is the most comfortable I have ever played in."

BURBERRY-PROOFS

Keep out the wet and are free from condensing heat. They have been tested in every climate and temperature, and everywhere pronounced the best.

BURBERRYS Patent Pivot Sleeve Golfing Jackets (for men and women) give an amazing freedom of arm swing and improve play 25 per cent.

BURBERRYS Slip-on is light to carry, cool to wear, gives ample protection in wet, is a handy and durable spring overcoat and perfect raincoat in one.

Many new models in Travelling, Country, and Sporting Gowns and Headgear, and 1905 Novelties in materials, viz., Rainbow Cloths, Gamefeathers, Plus Beau, and Airylight Herringbones are now displayed in Burberrys Ladies' Department.

"The principle of the SLIP-ON is a fine freedom everywhere, which keeps him dry and unfettered during a hard day's work in the rain."
—*The Field.*

"I have had several of your Slip-on coats, and as a country doctor I have found them very successful in every respect, and since using them I have practically discarded all mackintoshes, and have recommended your coats to several of my friends and patients, and they all speak very well of them."

BURBERRYS, 30, 31, HAYMARKET.

SEATS IN THE GARDEN.

EVERYONE knows what a nuisance it is, having decided to spend the next two hours over a game of croquet, to be obliged to go back to the house and bring out armfuls of mallets, balls, and clips, which insist on dropping and rolling away down the path, and which necessitate a great deal more exercise than is at all compatible

ON THE CROQUET LAWN.

with keeping cool. It makes just all the difference to find everything ready to the hand on the lawn, and the garden seat with box should appeal to the laziness, the legitimate laziness, of everyone on a hot July day. At other times, too, when a storm comes on, everything can easily be put under cover, and altogether Messrs. J. P. White of the Pyghtle Works, Bedford, are to be congratulated on the new designs shown here. Solidity and usefulness are noticeable features in all their garden furniture, and it always adds to the charm of beautiful grounds to be able to sit at ease and take in restfully the picturesque effects planned with so much care, without the trouble of having one's seat brought out or moved specially to the spot.

Seats of this kind will do equally well for tennis grounds or the bowling green where the village assembles in the evening to chat and watch and smoke, or dotted about cricket grounds will do much to help the waiting batsman possess his soul in patience while he watches the first two or three making hay of the bowling. In these days of long scoring, no inconsiderable time is thus spent in waiting, and the ability to do this comfortably will incline the tail batsmen to appreciative enquiries for the makers of these seats and induce further orders.

All games and scenes gain, too, by the presence of ladies at tea-time. Suburban cricket clubs draw quite an appreciable part of their income from "family" subscriptions, and the least they can offer in return are teas partaken of in surroundings and

A NOVEL DESIGN.

on seats that will not damage their summer frocks, nor prevent their thinking that the pleasantest way of passing a hot summer afternoon is to watch their brothers and their friends playing the national game.

LITERARY NOTES.

WHAT has been called the Celtic movement in literature is a thing we do not profess to understand. Literature itself is literature, whether it come from Saxon or Gael; and the ultimate criteria to be applied to the products of what has been called the Dublin School are simply those that should be applied to any books soever. One has come into our hands just now, called *The Story of Etain and Otinel* (Nutt), by E. Hamilton Moore. It is an imitation of an old saga. Perhaps it would be nearer the truth to say an imitation of an imitation, for the inspiration of William Morris is very apparent. We might call it a curious application of the Shakespearian dictum, "the evil that men do lives after them, the good is oft interred with their bones." Those "fakements" of William Morris, "The Waters of the Wondrous Isles," "The Glittering Plain," and similar romances, were the worst of him. They were modernised Malory, which pretended not to be modernised, but to follow the style of the original. They did not, and could not, do so, because it is given to no man to escape from the language and thought of the times in which he lives; so that the result was a strange mixture of modernity and mediævalism which was absolutely bound to perish. In the case of Morris this was greatly to be regretted, because he had the gifts of a true poet, and added much to our language and literature. But when we come to the imitation of an imitation, the Wardour Street within a Wardour Street, what shall be said? Mr. Moore, in the book before us, has fashioned a sensational novel of a type quite common when the three-decker was the rage. It begins, "There were three men loved one woman," and if it had gone on "her name was Sophia, and the Earl of Gaylands was one of her lovers, and the Marquis of Heavylands the second, and the third a plain yeoman named John Thompson," then it would have been quite in the old way. But the whole trick of the Dublin School is to translate these ancient conventionalities of the novel into what is termed, somewhat curiously, the language of romance, so that the three lovers become "Otinel, King of Farlands, Owain, King of the Marshes, and Brand, who was kinsman to Owain, and whom men called the Viper." Practically this is the *dramatis personæ* of the drama, though a Shield-may—whatever that may be—called Arlette, is dragged into it, and there are bards who make some very bad verses, and other supernumeraries of sorts. Plot within plot, tragedy within tragedy, poison, manslaughter, and ravishment—these are the materials of which a very sensational story is compounded. Of course, it is an advantage that when you take your people away to a land that never was, there is no need to stick to the rudimentary facts of human nature, and so the whole resolves itself into a mere play of puppets without anything to recommend them—not even fine writing. Unless the Dublin School can bring forth something greater than this, it will scarcely justify its existence. So far as we know it has not yet placed to its credit a single tale or poem that is really entitled to a place in the literature of the country; and even of those literary fragments that have been unearthed, the best that can be alleged in their favour is that they were writ in the glamour of the Celtic tongue. Intrinsically they are scarcely worth printing.

A number of beautifully-illustrated volumes are on our table at the present moment, among which the most important, both in regard to its size and intrinsic value, is *Great Pictures in Private Galleries* (Cassell). This is a sequel to a similar book giving the pictures in the public galleries in the United Kingdom. Among the pictures illustrated are G. H. Boughton's "The Lady of the Snows," Sir Edward Burne-Jones's "Green Summer," Arthur Hacker's "The Drone," and many other equally noted canvases. With each reproduction is given a critical description of the picture. The business of reproducing coloured pictures is one in which those who know most are continually expecting great things to happen, and perhaps one of these is that a process will be discovered which will render the work of an artist accurately. Meanwhile, the results obtained can fairly be described as astonishing. These reproductions of the works of great artists in private houses are certainly as good as anything of the kind that has yet been achieved, and which are quite worthy of being framed and hung in a room.

The same publishers send us their usual reproductions in black and white of the Academy pictures. Here no attempt is made to imitate the colouring of the original, but enough is shown to enable the readers to judge of the subject and, generally speaking, of the quality of the pictures on exhibition. The book is not one to buy instead of going to the exhibition, but visitors will find it a valuable help to their appreciation of the work hung in the gallery.

The Empire's Cricketers (Dawbarn and Ward) ought to be very welcome at the beginning of a season that promises so many interesting events as 1905. It aims at showing not only the portraits of the most famous and popular exponents of the national game, but also to give them in characteristic attitudes. In Part II., for instance, we have Dr. W. G. Grace at the beginning of an off-stroke—a very characteristic attitude, and caught with the accuracy of an instantaneous photograph. As much might be said of the portrait of P. F. Warner, showing the finish of an on-drive. Mr. MacGregor is caught about to take a ball on the leg side, and W. Rhodes in the act of delivery. They are all wonderful portraits, and full of life and vitality.

RACING NOTES.

BEFORE these notes appear some half-a-dozen horses, three of which are a long way removed from the first class, will have fought out the battle for the great race of the year, and a mighty roar from thousands of throats will have acclaimed with impartial greeting the hoisting of either the Union Jack of Old England or the Tricolour of France. When the huge £10,000 stakes were founded some twenty years ago there were not wanting wiseacres who proclaimed from the house-tops that the Derby was ruined, and that the glories of Epsom were destined to pale before the rising sun of the gate-money meetings. None of these things has happened, and in the teeth of all competition the Epsom Derby has maintained its prestige among the races of the world and its popularity with the multitude. The Derby is essentially a

"Full of those items of First Aid Knowledge, both surgical and medical which are indispensable to the Household."—LONDON DAILY EXPRESS.

ELLIMAN, SONS & Co, SLOUGH, ENG.

Free Trade institution, open to all the world, and with neither restrictions or penalties for foreign-made "goods," nor any protective tariff for articles of home manufacture; but up to the time of writing the only occasions upon which the Blue Ribbon of the Turf has been borne triumphantly away by foreign-bred horses were those upon which the mighty Gladiateur took the spoils to France just forty years ago, and when Iroquois in 1881 set the Stars and Stripes of America fluttering in the breeze. The owner of Gladiateur made more than one attempt to repeat his success, but could never improve upon Insulaire's second to Sefton in 1878. M. Edmond Blanc, the owner of Jardy, has twice seen his colours second in the great race, once when Common beat Gouverneur in 1891, and again two years ago when Vinicius had to put up with second place behind Rock Sand, and in 1892 M. Camille Blair's Bucentaure ran third to Sir Hugo and La Fleche. Gladiateur was, indeed, a great race-horse, and so marked was his superiority over animals of his own age that a widespread belief existed at the time that he was at least a year older than he purported to be; the foreign certificates of his age and breeding, however, were quite in order, and he ran for the Derby without any objection being made. When the time for the St. Leger came round, Mr. Graham did lodge an objection to him, and requested that his teeth might be examined, but in the absence of any valid grounds for supposing that the horse was older than he was stated to be by his owner, the stewards refused to act. Mr. Graham's mare, Regalia, ran second to Gladiateur, and again Mr. Graham objected, but without avail; and there is no doubt whatever that Gladiateur was actually of the right age and description.

Eleanor in 1820, Blink Bonny in 1857, and Shotover in 1882 are the only three fillies who have successfully asserted their supremacy over the colts in the Derby, but there have been brilliant failures, such as Lady Elizabeth and Sceptre. It may be of interest to note that the fastest Derby ever run was that won by Volodyovski in 1901, when he ran the distance in 2min. 40 4-5sec. In 1866 the first three horses in the Derby were sons of Stockwell, aptly named the emperor of stallions, and it is an interesting fact that Cicero, Jardy, and Signorino are all in direct descent from him. Stockwell is dead, but his fame lives on, and the fortunes of his house are always in the ascendant. 4,800 guineas was the price paid for Stockwell himself; Blair Athol, his son, fetched 5,000 guineas, and was afterwards sold to the Cobham stud for 12,800 guineas; the Duke of Westminster gave 14,000 guineas for Doncaster, then came the sale of Ormonde for 30,000 guineas, and Flying Fox for 37,500 guineas, and now Cyllene for 30,000 guineas, to say nothing of the 24,000 guineas given for the Duke of Westminster, and 20,000 guineas for Galtee More.

Fortune is at best a fickle jade, and it is well for the fortunate mortal who happens to be the recipient of her most lavish smiles and gifts to remember the saying, "latet anguilla in herbâ," the coy goddess loves a bold wooer, and right well did she reward M. E. Blanc for his plucky purchase of Flying Fox; but just when still higher rewards were apparently within his grasp, when all the great races of the year seemed absolutely at his mercy, and when a string of race-horses such as have never before been at any one time in the possession of an individual owner were at the very height of health and condition, illness broke out in the stable, which it is much to be feared will prevent several of the best horses from meeting their engagements. All good sportsmen will sympathise with M. Blanc in his misfortune, and all will hope that it may not be long before all traces of the malady will have disappeared. It is satisfactory to English breeders to see that the Prix Diane, or the French Oaks, has been won by Clyde, a daughter of Childwick and Common Dance, one of the mares sent over by the late Sir J. Blundell Maple to be sold in France, where she was originally purchased by the late Mr. Stern, but passed into the possession of M. Veil-Picard, who gave about £480 for the mare and foal.

The Doncaster Spring Meeting commenced on Thursday, the 25th, and, thanks to the pleasant weather which prevailed, can be described as a very pleasant outing, although the actual racing was by no means of a very interesting or exciting nature. Mr. Lambton had managed to get His Majesty into capital fettle, and he had no difficulty in disposing of Bonny Rosila and Killigrew in the Portland Stakes. The principal item of the day's racing was the Doncaster Spring Cup, for which seven horses went to the post, and Chaucer had little difficulty in presenting 3lb. and a length beating to Andria, who must have been a rather disappointing horse to Mr. P. H. Henning. Noisy Bill upset a supposed good thing in Galhampton, on whom 6 to 5 was laid for the Hopeful Stakes, and Mr. J. W. Larnach's colt by Jeddah out of Rondino won the Stockil Stakes, the last race of the day, beating Mr. Bell-Irving's colt by St. Angelo out of Applethwaite by three parts of a length.

A Skipper, belonging to Lord Lonsdale, is, I think, the only one of Merman's stock who has shown winning form in this country, and he added to his list of races won by winning the Scurry Handicap rather easily by three parts of a length. Merman was such a good horse himself, and is, moreover, so beautifully bred, that breeders should not be discouraged. It often happens that a horse who has been long in training does not get really good stock during his first few seasons at the stud, and there is every probability that before long Merman will prove that he is as good at the stud as he was on the Turf. The Chesterfield Handicap Plate of 500 sovs. found Love Charm in an amiable frame of mind, and that being so he had no difficulty in winning the 500 sovs. attached to the race for Sir E. Cassel. Two fashionably-bred fillies, Mr. C. D. Rose's by Cyllene out of Cortegar, and the Duke of Portland's by Orme out of Ismay, were among the starters for the Milton Stakes, but they received a tremendous beating from Mr. W. Elsey's Arise, and could do no better than finish second and third respectively.

At York, Mr. G. Faber had the satisfaction of winning the Great Northern Handicap of 700 sovs. with Fermoyle, who beat Lord Durham's King's Limner by four lengths. Those two old-fashioned races, the Zetland Stakes on the first day of the meeting, and the Eglinton Stakes on the second, were won respectively by Mr. G. T. Whipp's chestnut colt by Galloping Lad out of Evelyn, and Mr. Joicey's Orpheus, by Amphion out of Queen of the Vale, and The Flying Dutchman's Handicap, which was founded to commemorate the name of the winner of the great match between Voltigeur and The Flying Dutchman, was won, after a pretty race, by Mr. C. Perkin's William's Hill, 7st. 13lb., from Mr. H. J. King's Esquire, 8st. 2lb., and Mr. F. Langstaff's

There is obviously one "BEST."

A cycle may be the best "at a price." We do not claim to have reached perfection—that is impossible in anything manufactured, but we desire to point out that if you want a cycle upon which every possible care is bestowed in manufacturing and assembling the hundred and one component parts, and for which the most suitable material is employed regardless of cost, you should take an early opportunity of investigating the merits of the

LEA-FRANCIS

It is NOT manufactured to sell "at a price," but is designed and built throughout with the sole object of supplying the **Best Cycle Obtainable at Any Price.**

From the hundreds of letters received from customers testifying to the superb qualities of the "Lea-Francis," we have selected a few for periodical publication.

A leading Midland Cycle Agent writes: — "Your machines are without doubt the finest specimens of cycles that are produced."

A rider of experience extending over the whole era of cycle, writes:—"I cannot speak to highly of the machine. It is in my opinion the best I have ridden, and my experience of cycling goes back for nearly 30 years.

Catty Crag, 10st., and, although beaten, the latter was anything but disgraced, and made a gallant attempt to give the weight away.

The Salisbury gathering does not call for much comment, beyond noting that Sweet Mary had to put up with her first defeat in the Salisbury Foal Stakes at the hands of Mr. Wigan's Sarcelle; but the filly was running over a distance of five furlongs for the first time, and, moreover, may not have been quite herself, as she showed some disinclination to go to the post, which is quite foreign to her usual custom. News has unfortunately come to hand that Jardy has unmistakably developed symptoms of the malady which has attacked M. E. Blanc's stable with such disastrous effects. As if to accentuate the heaviness of the blow, the Prix du Jockey Club (the French Derby) has been won by M. Michel Ephrussi's Finasseur, who, after a desperate race, beat Clyde by half a length, the pair of them finishing fifteen lengths in front of Phœnix. The winner is by Winkfield's Pride out of Finande, and was bred by M. E. Blanc and drafted out of his stable on account of his inferiority to Jardy, Val d'Or, and others. Just a few short weeks ago M. Blanc's horses dominated the position, one might almost say in England as well as in France. All the great races in his own country were absolutely at his mercy, and there was an exceedingly strong probability that he would also take the Blue Riband of the English Turf to France. M. Blanc is too good a sportsman to complain, and it may be that the unmistakably sincere expressions of universal sympathy will go some little way to lessen the bitterness of the disappointment which has overtaken him. TRENTON.

RAILWAY ARRANGEMENTS.

THE Whitsuntide holiday programme of the Great Northern Railway aims this season at being more extensive and varied than usual. Friday, June 9th, for eight or seventeen days, to certain stations in the North Eastern Districts of England, and also to Scotland. On Friday night, June 9th, special excursions leave King's Cross for Midlands, Lincolnshire, Yorkshire, and Lancashire. On Saturday, June 10th, cheap express excursions leave for the Norfolk District, Lincolnshire, Nottinghamshire, North East of England, etc. The attractions of the Lincolnshire Coast are being prominently brought under the notice of the public, for special excursions are leaving King's Cross for Skegness, Sutton-on-Sea, and Mablethorpe. Tickets dated in advance will be issued at King's Cross (G.N.R.), Victoria (S.E. and C.R.), Ludgate Hill, Aldersgate, Farringdon Street, the suburban stations, and the various ticket offices.

The Great Central Railway Company will open their new pavilion on Cleethorpes Pier on the Saturday before Whitsuntide, and excursions will be run from all parts. Excursions are also announced from London (Marylebone), Woolwich, Greenwich, and Metropolitan stations to the principal towns in the Midland, North of England, North East and North West Coast watering-places, and Scotland. Fast trains will leave Marylebone at 12.5 (midnight) on Friday and Saturday, June 9th and 10th; and additional expresses will be run on June 10th. The information has been tabulated in an A B C Programme, giving the times of starting, fares, dates, and times of return, etc., for any stations, and copies can be obtained free at Marylebone Station, or at any of the company's town offices and agencies.

Special excursion tickets will be issued by the South Eastern and Chatham Railway to Paris, *via* Folkestone and Boulogne, on June 8th, 9th, 10th, and 11th. A cheap excursion to Boulogne will leave Charing Cross at 2.20 p.m. on Saturday, June 10th, and Sunday, June 11th, returning at 12.5 or 7.10 p.m. on Whit Monday. The Casino at Boulogne will be open. Similar tickets will also be issued to Calais by the 9 a.m. and 9 p.m. services. Cheap tickets to Brussels by the Calais, Boulogne, and Ostend routes will be issued from June 7th to 12th, inclusive, available for eight days. Special cheap eight day return tickets to Amsterdam, The Hague, Scheveningen, and other Dutch towns, *via* Queenborough and Flushing, will be issued from June 7th to 12th, inclusive, leaving Victoria and Holborn at 9.25 a.m., also to Liége *via* Ostend. Full particulars of the excursions, extension of time for certain return tickets, alterations in train services, etc., are given in the special holiday programme and bills.

The Midland Railway Company are running excursions on Thursday, June 8th, to Dublin, Cork, Killarney, the South and West of Ireland, to Belfast, Londonderry, Portrush, and to Londonderry by steamer *via* Liverpool, available for return any week-day within sixteen days; Friday, midnight, to the Midlands, for three, six, or eight days; and to the North of England, Glasgow, and Edinburgh, and other parts of Scotland, for eight or seventeen days; on Saturday to Londonderry, by steamer, for sixteen days; to the Midlands for two, five, or seven days; to all parts of the Midlands and the Peak District of Derbyshire, Lancashire, Yorkshire, and the Lake District. Every Saturday, to Hull, Bridlington, Scarborough, Whitby, Harrogate, Ben Rhydding, Ilkley, etc., to Blackpool, Lytham, and St. Anne's (except Saturday, August 5th), to Liverpool, Southport, the Peak District of Derbyshire, and to Morecambe, Lancaster, and the Lake District.

Cheap tickets available for eight days will be issued by the Great Eastern Railway to Brussels June 7th to June 10th inclusive, and June 12th to Liége, for its exhibition, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning, and Liége at noon, after a comfortable night's rest on board the steamer. For visiting the Hague, the Rhine, North and South Germany, and Bale, for Switzerland, special facilities are offered *via* the Great Eastern Railway Company's Royal British Mail Harwich-Hook of Holland route. For the convenience of passengers, tickets dated in advance can be obtained at the Liverpool Street Station Continental enquiry office. Also trips are planned to the West Coast of Denmark and Hamburg.

A series of land and sea trips to the French coasts, for Paris and the Continent, has been arranged by the London and South Western Railway. Tickets are available for fourteen days.

Facilities for intending Whitsuntide visitors to Paris and Normandy are provided by the London, Brighton, and South Coast Railway. A special fourteen-day excursion, *via* Newhaven and Dieppe, figures among the attractions.

"The English Lakeland" is the title of an illustrated guide-book by the Furness Railway. Notes are given on places of interest served by the company, and a list of hotels is appended.

A VITAL MATTER
WHICH CONCERNS
ALL STOUT PEOPLE.

THERE are at the present moment in this country thousands of men and women who, alarmed at the too rapid development of corpulency, are deliberately throwing away the precious gift of health and beauty through following some pernicious method of fat-reduction, involving semi-starvation, drugging by mineral poisons, exhaustive sweating, and other evils. This is a vital matter. Health and strength are priceless possessions, and should not be juggled away by old-time empiricism. None of these antiquated systems of reducing obesity was ever known to produce any other than a temporary loss of weight, unless by seriously undermining the constitution, which was too often the result. As a general rule, as soon as the remedy (so-called) was discontinued, the growth of superfluous fat resumed its evil sway.

Yet the gift of health and beauty is absolutely within the reach of any corpulent person, young or old, who will study the simple and harmless "Russell" treatment as set forth in the pages of "Corpulency and the Cure," by F. Cecil Russell, the founder of the famous treatment that bears his name. This standard work of 256 pages is full of useful information and advice, and no stout person should neglect consulting its pages. It contains, *inter alia*, the recipe of the principal curative preparation used in the "Russell" treatment. By the publication of this recipe the author triumphantly proves the complete harmlessness of the compound and the purely herbal nature of its ingredients.

Those of our stout friends who desire to obtain a copy of "Corpulency and the Cure" may do so by sending three penny stamps (for postage under plain sealed envelope) to the author, F. Cecil Russell, Woburn House, Store Street, Bedford Square, London, W.C. A careful perusal of this admirable treatise may be the means of saving years of misery to many a person who has been groaning for years under the humiliating burden of excessive stoutness.

Just a few words about the "Russell" treatment itself, which is entirely opposed to all other methods in that it nourishes the body whilst robbing it of the super-abundant fat. It is essentially the tonic, strengthening, muscle-forming treatment, and after a course of "Russell" the subject, whilst being reduced to normal proportions, is immensely improved in health and physical beauty, and feels years younger. The appetite is greatly improved, and a normal quantity of wholesome strengthening food must be taken. This is a fundamental condition of the treatment, which calls for no departure from ordinary, prudent habits of living. A reduction of weight occurs within twenty-four hours of beginning the treatment. This varies between ½ lb. and 2 lb. in usual cases, but when there is very excessive obesity the decrease may more nearly approximate to 4 lb. After the initial decrease there is a steady daily diminution until symmetrical proportions of face and figure and normal weight are reached. The treatment may then be abandoned. This easily followed, simple, sure, and health-giving system of reducing weight is commendable in every way. In a very short period it effects a wonderful transformation, and could not be otherwise than beneficial.

WHAT A FAVOURITE WEEKLY PAPER SAYS:—

Lady readers should be interested in the following views of the *Lady's Pictorial* on the success of the famous "Russell" treatment:—

"All unduly stout people suffer more or less inconvenience in moving about, with difficulty in breathing; and a want of general tone in the system is, as a rule, the lot of those who are the unfortunate possessors of an undue amount of adipose tissue, and who, in the trying of various remedies, have undermined their health without permanently reducing their weight. Mr. F. Cecil Russell, of Woburn House, Store Street, Bedford Square, W.C., has a cure for obesity which is most sure in its results, and, unlike most remedies for the reduction of weight, does not require any stringent restrictions with regard to diet. The treatment is entirely harmless, and the general health will be much improved by it. The ingredients used in the medicine are of a purely vegetable nature, as will be seen in the little book entitled 'Corpulency and the Cure,' written by Mr. Russell, the extreme popularity of which is shown by its having already reached the nineteenth edition. There is no doubt that the 'Russell' treatment goes to the root of the evil, hence the complete success of the cure. All those persons who are showing signs of becoming too fat should study the little book, 'Corpulency and the Cure.' The great success of this cure will be gathered from the many letters from those who have benefited by it. Many of these letters are printed in the little book, which can be obtained for three penny stamps from Mr. F. Cecil Russell, Woburn House, Store Street, Bedford Square, W.C."

Your Summer Dress!

With the advent of summer every lady and gentleman will be interested from a financial standpoint in our Patent Dry Cleaning Process, which, applied to **Suits, Silk Blouses, Muslin** and **Drill Costumes**, and expensive **Laces**, has met with such satisfactory results.

We have no hesitation in saying that it is impossible to distinguish an article so treated from a new one.

Neither in the colour nor in the feel of the material is the least injurious effect noticeable, and —an important point—no unmaking is necessary.

Soiled **Sunshades, White** and **Creme Serge Costumes, Panama** and **Gents' Soft Felt Hats**, as well as **Suede** and **Kid Gloves** (from **3d.** per pair), can also be cleaned with equally good results.

Gents' Suits Cleaned and Tailor Pressed, **4/6**.

Send a trial order at once. We feel sure you will be pleased with the results. If no branch in your town, send direct to **JOHNSON BROTHERS (Dyers), Ltd.**, (Dept. C.L.), **BOOTLE DYE WORKS, LIVERPOOL.**

THE SPLENDID KNICK-KNACKS.

A GREAT sale at Christie's in the full London season must always be reckoned with when the year's doings come to be chronicled. The sale of china, silver, and objects of art from the collections of the late Mr. Louis Huth, Mr. John Gabbitas, and others, will make 1905 memorable in the sale-rooms.

Mr. Huth was one of the sons of Frederick Huth, who, coming from Spain in 1809, founded the house of Frederick Huth and Co. The novelist, we believe, still supports, as a tradition of his craft, the fancy that the man of business, the banker or merchant, is a coarse soul, for whom "business is business," for whom beautiful things are unvalued trumpery. Yet business men, from the Medici to the Liverpool merchants who bought Rossettis in the teeth of academic criticism, have gainsaid the romancer, and the Huths proved themselves worthy successors of the Fuggers of Augsburg. Henry Huth's library remains intact, one of the famous libraries of the world, known to bibliographers through a catalogue worthy of it, and the collections of Charles F. Huth—pictures and engravings—have twice made material for a famous sale. The Louis Huth collection took a wider field, as is seen by the pictures, china, furniture, and silver which have lately been shown at Christie's.

In the sale of china appeared a certain covered vase 10¼in. in height, old Nanking with a pattern of plum blossom upon a marble blue ground. Its history was one to bring water to the mouth of the small collector who, avoiding Bond Street, rakes amongst the oddments of the little pawnbroker or the provincial dealer. Of its adventures on the way from the scented East to an English quay nothing is known, but thirty shillings was the price paid by the fortunate one who drew it from the back-shelves oblivion. He who had ventured thirty shillings went away happy with five-and-twenty of Mr. Huth's sovereigns in his pocket. Its first appearance in a London sale-room brought ample recognition of the value of this noble vase. Five hundred pounds

A DUTCH TABLE AND MIRROR—SEVENTEENTH CENTURY.

was the first bid for this "hawthorn pot," and from this the bidding rose until Mr. Partridge made it his own at a price of £5,900.

A pair of beakers and a vase brought £2,700, and with such prices before him the newspaper reader who knows naught of *famille verte* or *rouge de fer* might read languidly of the egg-shell plates with ruby backs for which the bidding ran but to a few score of guineas, of the Damascus dish at £500, of Rhodian and Persian faience, of roses, tulips, and persimmon fruit in blue and mauve, in green and brown.

The Friday sale brought the market a new sensation. With plate from the Huth collection, from Lord Montagu of Beaulieu and others, was offered a strange vessel of crystal and gold. This was a biberon carved out of rock crystal in the form of a pot-bellied dragon, whose head was a spout. The cover handle of enamelled gold was shaped as Neptune sitting upon a dolphin,

A TAPESTRY SCREEN—EARLY EIGHTEENTH CENTURY.

this and all the mountings being of enamelled gold. Strange to tell, this was a vessel without a history. Its fashion showed it to be German work of the middle of the fifteen hundreds, and its owner, Mr. John Gabbitas, had inherited it without a word to explain its splendid presence amongst his household goods. No exhibition-case had been honoured by receiving it, no catalogue had described it with affectionate detail.

Pieces in rock crystal rarely appear in the sale-room, but amongst the treasures of the Waddesdon Bequest the British Museum holds a little vase and cover whose workmanship indicates that the unknown carver of the Gabbitas biberon must have wrought upon it. The experts who gathered to the piece at Christie's from the capitals of Europe set its value at £10,000, but they had under-estimated the desire of possession, which carried its cost to the 15,000 guineas bid by Mr. Wertheimer, perhaps the greatest sum ever paid for a single object of art other than a picture.

The collector and the expert will draw from the account of these sales the moral that ancient work, fine in quality, advances year by year in value as it lies in the safes and cabinets of its fortunate possessors. For the moral of the political economist, who seems busied for the most part in manufacturing telling fallacies for the political platform, we may wait in vain. Here, at a time when financiers assure us that trade is failing, that unwilling retrenchment is beginning in every class, we see a sum which represents the hopeless ideal towards which the average professional man struggles through his best working years, passing from hand to hand for a single wine jug of a rare fancy. Such a day shows us that vast sums of money are loose in the hands of men of refined extravagance, and wild as the last bid for the Gabbitas biberon may sound in the ears of men of small possessions, we read of it at least with more sympathy than that which we can extend to the paragraph which tells us of the silver motor-car and the lap-dog's lace handkerchief.

CORRESPONDENCE.

A TAME SEAGULL.

[To the Editor of "Country Life."]

Sir,—Peter was a seagull, one of four brought from the Scilly Isles by Mr. Charles Wood when making a tour in Cornwall, and the only one of the quartette who distinguished himself in any way. He was separated from his companions and given to a child living at Grove Hill, Falmouth, and, little fluffy grey ball as he was, only a few weeks old, he showed his spirit at once, and spent the first night picking viciously at the bandbox in which he was confined. In the morning he declined all food offered to him except raw fish, and this was his diet for some time. One day, however, he became acquainted with a house-snail, and after that those succulent morsels had a speedy shrift when they crossed Peter's path; but, before swallowing them, he washed them carefully in a jampot of drinking-water which was always placed ready for his use. Later in life Peter discovered that mice were good (also well wetted), and many a time might be seen with a long tail hanging out of his bill and his throat looking as if he were suffering from mumps. At this stage of his existence he also condescended to eat meat. His next taste was for poultry, but, as he preferred young ducklings alive, this taste had to be checked, and Master Peter kept out of the poultry-yard. One day a fine duckling was rescued just as it was disappearing down his throat; and it survived to grow up into a large white drake twice the size of its would-be murderer. When Peter's wings grew he flew about freely, circling round the house at no great distance, responding to calls with the gull's plaintive cry, and always coming down for his food, and to be put to bed at night. A sea-fog came on one day; Peter lost his bearings in it, and for three weeks was mourned as lost. He had got into the harbour, where he was caught by a dog, and given to a boy who lived near his own home, and who willingly gave him up to his mistress, when the bird was heard and recognised. Peter showed himself well pleased to return to his old quarters and to his great friend, the cook, but his clipped wing was never allowed to grow again, and henceforth he belonged to the earth only. A change of residence brought him to Hagley in Worcestershire, and here he shared a small back garden with a retriever pup and two kittens, and also developed a great liking for the kitchen fire. Cook placed a piece of carpet in front of it for him, and woebetide either of the kittens who ventured to intrude upon this privileged spot. Peter's beak was strong and sharp, and after one peck from it the enemy turned tail and fled. Peter was a dignified bird, even in his most undignified proceedings, and it soon became evident that he disapproved of kittens altogether, and objected to their frivolous ways, which he took upon himself to correct. Everything that the poor little animals found to play with was immediately taken away from them by Peter—unless he happened to be engaged with a snail. One day they were having a fine game chasing each other in and out of a piece of drain-pipe which lay with one end against the wall, leaving only one entrance and exit. Up hurried Peter, "This must be put a stop to!" in every movement. Both kittens retired into the pipe at his approach, and there they had to stay whether they would or no, for Peter mounted guard at the entrance, and any attempt at escape was met by a prompt peck on the protruding head, which sent it quickly into retreat again. How long they would have been kept prisoners no one knows, but the onlookers taking pity on the kittens, a rescue party was sent to raise the siege and rout Peter. Hagley being only a temporary place of sojourn, Peter was soon removed to a new home in the next county, where a large pond and numerous ducks promised to be an attraction for him. The pond was appreciated, the ducks were not; from the first day to the last he scorned them, and kept himself aloof even in the water. At night he had to share their yard, but, declining the shelter of the houses, perched in solitary state on a pile of stones in the centre. But Peter, though proud, was not without a heart, and he gave his affections to the retriever pup, who reciprocated them, and this friendship was never broken. Tara grew up into a very fine dog, and Peter's favourite perch was on his curly black back as he lay on the doorstep. Only one thing ever disturbed their perfect harmony. Peter did not understand Tara's tail, and was greatly disturbed when it wagged. He would look at it disapprovingly, then hop down and give it some vigorous pecks, and return to his furry seat till the offence was repeated, when he again remonstrated in the same way. Peter was also fond of human companionship in the shape of the fair sex; he did not like men. He would lie for hours on the lawn by the side of his mistress, and would thoroughly enjoy a game of hide and seek round the trunk of a tree with a little girl whose unprotected legs he loved to peck. At this game Peter was very clever; he would turn his head and pretend he was going one way and then suddenly dart in the opposite direction, taking the child by surprise. Peter was free to wander where he pleased in the grounds, and he sometimes found his way into the kitchen garden, which was surrounded by a wall. Peter enjoyed these visits—the gardener did not. A spirit of mischief seemed to enter into the bird when he got inside the garden door, and the gardener suffered. One day the man was planting out young cabbages, and having finished a long row, looked back to survey his work. Not a plant was to be seen; but Peter was close by. He, too, had been busy, and as fast as the cabbages were put in he had pulled them out. On another occasion he found a number of pots in which seeds had been sown and the contents carefully marked with wooden labels; these labels Peter took out, and confusion reigned among the pots. Yet another time a bag of seeds was lying on the path; a little shaking on the part of Peter and the bag was emptied and the seeds beautifully mingled. Can it be wondered at that the gardener declared that "if that owdacious bird came any more into the kitchen garden he would kill it"? But the threat was a very empty one. Poor Peter met his fate, however, from another gardener whom he had never injured. Frightened by a military funeral, he strayed away through several fields into a neighbour's garden, where the gardener shot him, thinking he was an eagle! Never was bird more regretted.—A. R.

DUCKS AS EGG-EATERS.

[To the Editor of "Country Life."]

Sir,—Last Sunday a duck alighted on the water in Kensington Palace Gardens close to us. She had a duck's egg in her mouth, and immediately broke it up and swallowed most of its contents. This raises rather an interesting point. Had she stolen it from another bird's nest, or was it an addled one from her own which she was thus getting rid of? If some ducks, like rooks, take to egg-stealing, keepers will have to detect and get rid of such robbers.—H. P.

BIRDS' NESTS.

[To the Editor.]

Sir,—I enclose a list of nests found this year by my brothers and sisters and myself within a radius of eight miles of our home. We thought it might be of interest to some readers of your paper, and we shall be very pleased to answer any questions in regard to the nests, eggs, or habits of the birds mentioned. Goldfinches have this year been very plentiful with us; thirteen nests out of the fourteen have been found in our own garden and grounds. I should like to say that we have, both this year and last, found some very curious robins' eggs, more resembling those of a greenfinch, both in shape and colour. Last year, we sent one of these eggs to the editor of another paper who, however, wrote back and said the egg was not that of a robin, but could not, when we asked him, tell us what he thought it was. As we had seen the bird on the nest, we knew the eggs to be robins'; and this year, finding a nest with very similar eggs, we were careful to watch it, and saw four young robins successfully hatched from the eggs. We are, however, doubtful of being able to convince that editor of the truth of this fact, and so this year we are communicating with you.—Margaret C. Kelly, Kelly House, Lifton, Devonshire.

List of birds' nests found between February and June, 1905, in an eight-mile radius of Kelly. Total, 1,096.

Blackbirds	321	Whitethroat	1
Thrushes	204	Grey wagtails	4
Missel-thrushes	42	Pied wagtails	2
Robins	110	Yellow-hammers	9
Wrens	126	Wood-lark	1
Chaffinches	78	Chiff-chaffs	4
Greenfinches	43	Blackcaps	3
Bullfinches	6	Wood-pigeons	6
Goldfinches	14	Moorhens	5
Linnets	41	Dippers	2
Hedge-sparrows	37	Pheasants	2
Tomtits	5	Crow	1
Long-tailed tits	16	Woodpecker	1
Golden-crested wrens	11	Magpie	1

AN INTERESTING ALLIANCE.

[To the Editor of "Country Life."]

Sir,—The following may be of interest. Last year, two young stock-doves which had fallen from the nest before they could fly were caught and kept in an aviary in which were two pairs of Barbary doves. This spring, all six birds were allowed their liberty, and, by the various accidents which happen to pets, were soon reduced to two, a male stock-dove and female Barbary dove. These birds paired, and now are rearing one squab, one of the eggs having been broken. Their offspring is now about half-grown, well feathered, and strong and healthy. In general shape and appearance it partakes more

of the stock-dove, but its colour is fairly well divided between both parents, forming a fine French grey; but it is still too young to allow of its colour being definitely fixed. The aviary had two possible nesting-places, one a large box with a hole in it, and the other a smaller one open on one side. The latter would most likely have been selected by Barbary doves, but the former was chosen, being the most suitable for stock-doves, due, I take it, to the fact that the male bird selects the nesting-place. The birds had every opportunity of nesting out in the trees, and the stock-dove, at any rate, had every opportunity of selecting a wife of his own species, as there are plenty of wild ones about, and he was set free two or three weeks before starting nesting.—W. J. Brooke.

CUTTING THE EARLY GRASS.

[To the Editor of "Country Life."]

Sir,—At the present moment, when in the South of England farmers are just beginning to cut the first swathes of hay, you may like to publish a photograph showing the return homeward of the mowers. I remember quite well when all this work had to be done by men, and the sound of the scythe swishing through the grass, or being sharpened on the whetstone, was as familiar at this season as the cry of the landrail among the young corn.—U N.

A WARWICKSHIRE STEADING.

[To the Editor of "Country Life."]

Sir,—Shakespeare is in the air this year; but Shakespeare has become so identified with towns, libraries, theatres, and other stuffy places that it may not be out of place to recall the out-of-door England of his day. I am not aware that he ever so much as saw the Warwickshire homestead of which I send you a photograph; but, if I may so express it, he certainly ought to have, for there is no question but that this quaint old thatched building—though some of its details, like the chimneys, are more modern—has lived as long as his fame. The London of to-day would frighten him out of his life. The Warwickshire of to-day is the Warwickshire of the sixteenth century—rich, level, sweet to the eye and nostril, a little sleepy, a little unkempt, thoroughly and characteristically English. All the wars in our history have swept over Warwickshire, the central county of England, yet Warwickshire remains what it was 500 years ago; and no more typical scene could, I think, be discovered than the view I send you. We are more careful of our orchards here than they are in Gloucestershire, for instance, or Devon, where many bushels of apples are lost yearly through neglect to prune and to lime; but our hedges, as you may see, are as much like Struwelpeter's hair as they were in Shakespeare's time, when farming was not the bustling, scientific business it is to-day.—L. G. R., Leamington.

AN INTERESTING LINK WITH THE PAST.

[To the Editor.]

Sir,—I am sending you a photograph of an extremely interesting old character; it is the portrait of Mr. James Carne of St. Columb Minor, Cornwall, who occupies the unique position of being the oldest parish clerk in England. Born nine years before the battle of Waterloo, viz., on May 3rd, 1806, he commenced his duties sixty-one years ago, succeeding his father, who held the office for fifty-two years, and who died at the age of eighty. Mr. James Carne's grandfather was also parish clerk for half a century, as the following inscription on his headstone in St. Columb Minor Churchyard will show: "Here lies the body of James Carne, who discharged the office of Parish Clerk for upwards of fifty years. He died the 31st day of January, 1801, in the eighty-seventh year of his age." It will thus be seen that Mr. Carne, his father, and grandfather have held continuous office for 163 years! Until a year ago, Mr. Carne had been absent only once from his place in church, viz., on the Sunday after his wife passed away, at the age

of 87; and even now he rarely misses the Sunday services, and is always a prominent figure at weddings, christenings, and funerals. He has always been a keen musician, and in his younger days he played the flute in the church orchestra. He is full of interesting reminiscences of those old days of the "Nebuchadnezzar's Band," and his flute is one of his most treasured possessions. For several years after he succeeded his father in office he sang in the choir, and had to migrate to the gallery at the west end of the church. Many parishioners can recall him as he marched back to his desk, saying the responses as he walked. He greatly regretted the disappearance of the orchestra, which consisted of a small harmonium, a fiddle, a base viol, a clarionet, a flute, and on special feast days a cornopean. There are few now alive who can remember the "Oh, be joyful" of those far-off days. Many of us would like to see the church band revived. "No doubt the playing was not very good, and the instruments out of tune," says the Rev. Baring Gould; "no doubt also there was much quarrelling and little harmony amongst the performers, but an institution should be improved and not abolished." "The old order changes"; not only has the orchestra gone, but the old country types are fast disappearing, and soon it will be difficult to find an official like the grand old man of St. Columb Minor. I must not forget to mention that for twenty-one years Mr. Carne was rural postman, and did his round of ten miles (Sundays excepted) without missing a single day! Perhaps this exercise, combined with strictly temperate habits, will account for a long life, which has been quite free from illness; in fact, till he was well over ninety he hardly tasted doctor's "trade." He still takes a keen interest in every-day affairs, and his views on the "Fiscal Policy" are coloured by his remembrance of some "lively times" in the days of his youth. When he talks about the smuggling that took place in the little port below the village, and of the excitement of the villagers when the pilchards visited the bay in "schools," one can quite understand why his conversation is mainly concerned with what he calls the "good old times." He emphatically denies that the Cornish folk of his youth were addicted to wrecking, as is generally believed, and smiles at the idea that fires were ever burnt on the top of the beautiful church tower to lure vessels to their destruction. Although Mr. Carne now leads a very quiet life, he still walks about the village, and sometimes he gets as far as Newquay, a distance of two miles. If he has a recipe for a long life it may be summed up thus: "Be temperate, never coddle, and don't worry." His numerous friends hope that he will continue to enjoy a green and smiling old age.—WILLIAM J. STEPHENS.

THE DANDELION.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Very few people are capable of recognising the beautiful in the common, or they would admit that the dandelion is one of the most charming flowers in the English flora. No one has romanced about it as much as has been the case with the wild rose, and it has made nobody as sentimental as Burns was over the "wee, modest, crimson-tipped flower," for, truth to tell, it is one of the most noxious of weeds, with roots as deep as sorrow, and a persistency that would be worthy of a better cause. You chop off its head again and again, and still it pops up as confident as ever. But that knowledge ought not to prevent us from doing justice to its assured beauty. As a flower it is exquisite, and when the flower is gone, and it is succeeded by the downy seed, which country children use as clocks, it still remains, as in our photograph, one of the most beautiful ornaments of the wayside. Nor is it altogether useless. The dandelion makes good food for rabbits, and its bitter milk has long been noted for certain medicinal properties. Dandelion tea is a concoction that old women are proud of. But most I like to watch the children with pouted lips blowing the dandelion and counting the puffs to tell the time of day. It is prettier than the "Yes, No, Yes, No, Yes," of Marguerita and her kind.—X.

OLD WINCHESTER.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—The quaint old house shown in the photograph, and known to the inhabitants of Winchester as Old Cheesehill Rectory, dates back to 1450, and is said to be the oldest house in the town. Much anxiety has been aroused as to its ultimate disposal, as it was to come under the auctioneer's hammer lately, and hope has been expressed that someone would be found to preserve it from the hands of builders, "restorers," or other Philistines.—N. P.

POLLUTION OF THE RIVER TWEED.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—At last the Tweed Commissioners have awakened to the fact that the river and its tributaries are, to the detriment of angling, being seriously polluted, and with a view of remedying the evil the services of the local county councils are being requisitioned to deal with the matter. On the motion of Lord Polwarth, the proprietor of the well-known Mertoun stretches of the river, seconded by the Earl of Minto, the Roxburgh County Council, at a meeting held lately, decided to petition the Local Government Board and the Secretary for Scotland to constitute a joint committee representing all or any of the counties through or by which the river and its tributaries flow, for the purpose of dealing with and securing if possible an abatement of the pollution of the river. It is time that an authoritative step should be made to take the matter in hand. No doubt during the past few years the public health authorities have done much to mitigate the more glaring cause of pollution, but those who are conversant with the different streams of the Scottish borderland cannot fail to observe that pollution still exists, and in some cases most serious pollution. Much of this, of course, is accounted for by the numerous manufactories of the Border towns which lie contiguous to the river, and a plea has been raised that should the authorities make it imperative that the refuse at present emptied into the stream should be disposed of in some other manner, a great hardship would be placed on the manufacturers, and that it would practically mean the destruction of a trade which finds employment for hundreds of workers. But this plea cannot be seriously considered. No one maintains that for natural drainage rivers may

not be subservient, but the plainest principles of law, and the general interests of the community, apart altogether from an angler's point of view, alike forbid that rivers such as the Tweed should, by artificial means, and for the convenience of a few individuals, be changed in character and converted into streams capable of generating and spreading all manner of disease. But it is not from the effects of such pollution that the Tweed suffers most. In a court of justice it has been stated that about one-fifth of the dwelling-houses of a large manufacturing Border town had private drainage systems, and that all were drained directly into one of the tributaries of the Tweed. Ultimately, it does not need to be said, all this sewage and other stuffs finds its way into the main stream, where, besides ruining the salmon bed, and making the salmon pools like cesspools, it is a menace to the health of the community. After a spell of dry weather one has no difficulty in observing to what extent this stream is polluted. It is so discoloured with sewage matter that the sight is often sickening, and the stench which arises therefrom is most obnoxious. And yet these banks are the playground of young children, breathing the air contaminated with the pollution. Instead of helping to promote health, the environment of the stream is liable to promote disease. But apart from a health point of view, serious as that no doubt is, these beautiful streams of our Border counties, long famous for their excellent salmon angling, cannot fail to suffer from the befouled state of the water, and it cannot be wondered at that one hears so much nowadays about the decadence of the Tweed salmon-fishings "It's naethin' tae what it used tae be," was the remark passed by a well-known local fisherman, and his remarks will be endorsed by many who for years past have sought their sport on the casts of the Tweed. Now that the matter has been taken up, however, all true sportsmen will follow with interest the results of the efforts which are now being put forward by the Commissioners, and no doubt the riparian proprietors will do their utmost to assist by all means in their power the endeavour to eradicate an evil which is a potent factor of the deterioration of the Tweed salmon angling.—TWEED-LOVER.

COOTS FEEDING THEIR YOUNG.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—Though some marine diving birds, such as the cormorant, feed their young assiduously when in the nest, none of the many species of wild duck, so far as I have noticed, ever place food in the mouth of the young when on the water with them in the same way as land birds, like the sparrow, starling, or wagtail, which feed the young birds long after they can fly. Very possibly dabchicks do so, but I have not seen it. But on Saturday last I saw a very pretty family scene, in which some coots were catching some invisible food and feeding their brood with the greatest regularity, and as if it were quite a matter of course. The brood consisted of two old coots and four young ones, the latter about the size of blackbirds. They were all sunning themselves and doing nothing particular near the bank of a large pond, but as we disturbed them they swam quietly over to the other side, near to the further bank. Some time after, as I was going home, I passed near the coots, and then noticed that both parent birds were catching something, generally on the surface of the water, but sometimes after a short dive, and putting this, whatever it was, into the beaks of the young ones. The prey cost them no effort to catch, and it was all done with great deliberation, though very frequently. One of my companions held a watch while I counted that the old coots presented the young ones with the *bonne bouche*, whatever it was, exactly twelve times in one minute, or once every five seconds, the pair together, that is to say. I thought at first that they must be picking up small caterpillars which were dropping in numbers from some trees near; but they were some way from these, certainly rather too far to find the caterpillars in such numbers. We then examined the water near them, and found that it was full of tadpoles, which is probably what the coots were feeding upon. On the other hand, the caterpillar swarms which were devastating the young leaves of the oaks were being dealt with in a very effective manner by the starlings. Scores of these active birds were picking them off the leaves of the oaks most infested. Others were running about on the ground under the trees in all directions seeking the grubs which had fallen, and often a bird circled round under the lower branches and neatly caught a caterpillar hanging from its thread in mid-air.—C. J. CORNISH.

AN EXPERIMENT IN ADOPTION.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—From time to time the newspapers quote stories of cats adopting rabbits and squirrels and bringing them up with their kittens. Some weeks ago I determined to try whether my own cat would take kindly to such a foster-child. She is a notorious poacher, and has on more than one occasion caught young rabbits and brought them home for food. I knew, therefore, that it was quite possible that she would kill and eat any rabbit placed in her nest. She chose to have her kittens in a large clothes-basket in one of my

bedrooms, and as I had a litter of semi-wild rabbits, just old enough to see, and, of course, with their fur on, I took two of her kittens away and introduced a rabbit in their place whilst she was absent from the room. He was very wild for a little while, but finding that the remaining kitten was warm, nestled down by his side, and was in that position when the cat returned. She was evidently a little surprised at what she found, and for a few moments smelt the rabbit carefully. Then, to my joy, she settled down with a satisfied purr. I have no doubt that, owing to the fact that there is a very strong "catty" smell always accompanying a young litter of kittens, that the characteristic smell of the rabbit gets easily lost. It may be taken for granted that when a cat brings home a rabbit or squirrel, she intends it for eating; but being introduced to her nest, and perhaps played with a little while, it becomes protected by sharing in the strong scent of the litter. I was not at all sure whether the rabbit would attempt to feed from its new foster-mother; but it evidently did so in a very short space of time, for the next day the cat, finding her present home rather too open to the light, and her rabbit in consequence a great deal too lively, moved her family, rabbit and all, to a heap of old clothes in a dark cupboard in another part of the house, and here she brought them up. I may here remark that she attended to all the sanitary arrangements of the rabbit as well as her remaining kitten. Later on, as the photographs show, she brought them proudly downstairs, and the rabbit shared the saucer of milk with the kitten. To-day they are all loose in the garden. The rabbit has become a great deal more independent, and of course feeds far more on the grass and other food proper to its kind. The kitten stumbles clumsily after it, and delights in playing with its companion's long ears. At night, however, the rabbit always goes back to the cat's box and sleeps with his adopted family.—S. N. SEDGWICK.

A STRANGE FOSTER-MOTHER.

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—The accompanying photograph shows a remarkable instance of foster-motherhood. The old hen having been unsuccessful in an attempt to hatch a family of her own kind, clucked disconsolately about the farm buildings, eventually discovering—in the absence of their mother—a litter of spaniel pups, at the time only a few days old. She immediately offered them protection, and the pups at once took to their strange foster-mother, doubtless appreciating the warmth afforded by the plumage of a fat old barn-door fowl. Though the pups are now five weeks old, they are still to be seen following the old hen about the farmyard, and whenever she settles down there is a rush for the cosiest corner under her wings. The mother does not apparently resent this state of affairs; she takes little notice of her offspring, and they only go to her at times when hunger compels them to seek natural nourishment.—C. LAVDON.

"HEAVENLY DEATH."

[TO THE EDITOR OF "COUNTRY LIFE."]

SIR,—I have read with great interest your review at page 713, "A Book of the Week." Very well you have described the uneasy feeling many of us have at times on the greatest of problems that we all shall solve some day. But is it not well to cleave to the sunny side of doubt? At this season of the year the solemn story of our Lord's return to life is a joyful fact and foretaste of what we humbly believe will be our—and not so much ours but of those we have loved—lot. I may add, Plato's "Phædo" is another book to help our faith when tried by the strong and cleverly reasoned arguments and facts of science; the whole treatise is to me summed up in "Καλόν γὰρ τὸ ἆθλον, καὶ ἡ ἐλπὶς μεγάλη"—"glorious indeed is the struggle, and the hope is great."—JOSEPH CLARK.

ONE of the chief features in evening dresses this season is the use of gold and silver tissues. This was particularly noticeable at the recent Courts, when all the most successful dresses had either a foundation skirt of silver tissue veiled in chiffon, or a train of the same shimmering material, or, if the love of silver did not go so far as that, it yet appeared in silver paillettes or trimmings of silver roses. Lady Dalhousie's dress, for instance, was of pale pink chiffon spangled with silver, and beautified round the hem and on the bodice with silver roses, the accompanying train being of real lace over silver tissue, garlanded with the beautiful silver roses. This was one of the most successful dresses in its delicacy of colouring, and suited the lovely young wearer to perfection. Lady Eden's Empire dress of pale green over white proclaimed this popular note of metal in the train of gold tissue, and the embroidered gold sash. Lady Crawford also supported the claims of gold in her train of gold tissue with her white satin dress. Princess Louise, Duchess of Argyll, combined both effects of the rival metals, for her dress of white satin was elaborately embroidered in silver, and was worn with a train of gold tissue powdered with silver sequins. This use of gold and silver tissues is one of the dominant notes of the season, and is exceedingly effective at night, especially in Court trains, when the beauty of the shimmering material can be displayed; and even in millinery one finds it repeated in the bunches of silver roses with gold leaves, or gold roses with silver leaves, which may be seen on some of the smartest Paris hats. Such a feature could not have been ignored at the Haymarket Theatre, where the revival of "The Cabinet Minister" has been made the excuse for an exhibition of the most lovely series of frocks that have adorned the stage this year. Miss Emery's first dress (a Court gown) is of cloth of silver shot with blue and sparkling with diamond embroidery, which also appears on the train of turquoise blue velvet. Her dress in the last act also shows the charm of silver and gold. It is of white tulle, embroidered in a design of pink and yellow roses and gold corn, caught with bows of silver, which trimming is repeated on the bodice. The most successful dresses, however, are those worn by Miss Fortescue, which were made by Mme. Hayward. No doubt a considerable part of the success of these dresses is owing to the way they are worn; for Miss Fortescue is not only blessed with the daintiest and roundest of figures, but she has that exceedingly rare gift (which is quite apart from histrionic talent or personal beauty) of knowing how to wear her clothes. Her first dress is a Court gown in black tulle, with a thistle design in jet which covers the skirt all over, the full tulle ruches round the feet winding in and out among the embroidery in a very original fashion. The shoulder-straps are in diamonds and the short sleeves in black tulle; and the black velvet Court train is caught between the shoulders with a jet butterfly, another butterfly adorning the corner of the train, which is lined with black spangled net. It is curious how effectively this black dress stands out among the coloured

WHITE SERGE FOR THE SOLENT.

ones on the stage. The prettiest dress in the play, however, is the one I have had sketched for COUNTRY LIFE, which Miss Fortescue wears in the last act. It is of electric blue tulle, with gold and silver embroidery. The bodice is very full and round above the deep ribbon belt, and is adorned with a large butterfly bow of tulle in front, caught by a crescent of gold and silver. The bretelles of blue silk ribbon over the shoulders leave the top of the arm bare, and cross at the back; and charming little sleeves of kilted blue tulle hang loosely over the upper arm. The full tulle skirt is trimmed very simply with two lines of the blue ribbon passing through the embroidered crescents of gold and silver. The combination of the electric blue and the crescents gives the whole dress a most delightful moonlight effect, which is exceedingly becoming to Miss Fortescue's fair colouring and golden hair, in which, by the by, she wears silver wings. It is not my province here to speak of the admirable acting of Pinero's brilliant comedy, but, from the purely feminine point of view, the dresses alone should draw all London to the Haymarket Theatre.

JEWELLERY AT MESSRS. SKINNER'S.

When one has made up one's mind as to one's summer campaign, it is well to take thought about one's kit, and to those whose lucky fate is to go yachting, I would recommend a study of the sketch on the previous page of a yachting dress at Nicoll's, in Regent Street, which combines all the qualities of neatness and smartness which are so absolutely necessary for a costume of this kind. The material is of white serge, the skirt being set in pleats round the waist, each fold being stitched flat round the hips to preserve grace and neatness of outline, while the folds give fashionable fulness and comfort when they are allowed to flow free. The little bolero fits close to the figure, and is outlined with scrolls of white silk braid intermixed with a thread of gold. Little gold buttons fasten the pointed waistcoat of white linen, and also the plain linen sailor collar, above which there is a second little coat collar in serge, edged with the braid. The full elbow sleeves finish in turned-back cuffs, edged at both sides with quillings of white linen, and the belt of deep blue leather is matched by the bow and tie of deep blue satin. The little hat that accompanies this dainty frock is of white straw, simply trimmed with a band of deep blue satin and a white wing, and tilted forward by a deep bandeau, with bows of the same blue satin at the back; and the veil, which should be tied under the chin, in the most becoming fashion set by motorists (the only becoming thing we owe to that charming pastime), is of white chiffon with blue spots. It would be impossible to find a better model for a yachting or river dress than this sketch; and it would be equally effective carried out in deep blue or deep red serge, keeping, of course, to the admirable white linen sailor collar and waistcoat and elbow frills of the original.

A MOONLIGHT EFFECT IN BLUE TULLE.

Jewellery is more than ever the fashion this year, which is probably explained by the popularity of lace, for lace and gems have always gone hand in hand in feminine affections. The beauty of modern designs and settings has also helped to increase the love of jewellery; for the delicate jewels of to-day, hanging by almost invisible chains of platinum, are very different to the "ironmongery" ornaments which satisfied our more material grandmothers, who preferred their ornaments to be weighty in appearance. I am illustrating this week some exquisite ornaments I have seen recently at Messrs. Skinner's in Orchard Street, Portman Square, which were as remarkable for their delicate beauty of design as for their unusually low price. The floriated necklet in diamonds, mounted in platinum, was priced for cash at £64 7s., and was a most charming ornament. The beautiful pendant above it in diamonds, with a fine cat's-eye in the centre and another one hanging below, was only £76 5s.; and the original drop pendant in brilliants (with a lovely pink tourmaline in the centre) was only £31 10s. The charming pendant on the left of the diamond necklet had diamonds set at intervals along the two platinum chains, which were held together by a Persian turquoise set in brilliants, the chains ending in two other turquoises, bordered with diamonds, its price being £76 10s., while the one on the right, two fine pendants, set with diamond and pearl bows on platinum chains, was a marvel of cheapness at £33 15s. Now that weddings are rife in the land, it is well to know where such lovely gifts can be purchased so economically.

Broderie Anglaise is more to the fore than ever, and indeed nothing is more feminine and becoming and, strange as it may appear to say so, more lasting than a dress of this charming white embroidery, which was so popular with our grandmothers. The latest adaptation of the broderie Anglaise is to use nothing else in an entire costume; the dress, the coat, the hat, and the parasol should be of nothing but this embroidery, with hardly a note of colour to mar its snowy completeness. The effect, no doubt, is harmonious, but I draw the line at the embroidered muslin or linen hat, which, to my mind, is never smart enough to accompany a race-frock, for instance, however becoming and appropriate it may appear on a country lane or in a punt. With a smart dress of broderie Anglaise and lace the hat should be in white chip or crinoline, if an all-white effect is desired, and the trimming of such a hat should consist of soft white ostrich tips and little Pompadour roses, some of the most

Rosy Cheeks

Made by a good food.

An old saying is that the human body entirely changes every seven years; that is, we now have no elements in our system which were there seven years ago. It is certain that we can change from the vigour of buoyant health to a debilitating illness in a very short space of time, and sometimes, if we are fortunate in finding just the proper re-builder, the disease is driven out and health returns just as quickly.

A lady living in Acton, W, writes:—

"It is with both pleasure and gratitude I write to tell you of the splendid results we have derived from Grape-Nuts. For years, almost since childhood, have I suffered from nerve troubles, neuralgia, etc. Some months ago my husband persuaded me to give Grape-Nuts food a trial. The first packet I had I felt the benefit of, and since, needless to say, I have never been without it, using it in many of the delightful little recipes given with each packet. These wonderful little recipes prevent the monotony felt so often by other foods. I sleep better, feeling refreshed in the morning, I have also gained both flesh and rosy cheeks, lost my neuralgia, and, generally speaking, feel in the best of health. I feed my little girl with it also; she, like myself, suffered from anæmia, and was a constant worry and trouble to me, but now I am delighted to say she is the picture of health. I strongly recommend all mothers to use Grape-Nuts, and they cannot fail in getting the happiest results, for it is certainly the most palatable food I have ever tried for children, and they thrive wonderfully on it."

No more certain re-builder can be found than Grape-Nuts, for it contains the elements necessary to renew the nerve and brain tissues, and the starch in the grains, from which it is made, is changed, in the manufacture, to a form of sugar, and this renders it easy of digestion to invalids and children, as well as those in the prime of health.

decorative of these being in tones of pale blue and pale green, which blend delightfully in a garland with the pink pompon roses.

There is a widespread and utterly unworthy superstition entertained by many people who ought to know better that

A BRITISH REPRODUCTION OF A LOUIS SEIZE COMMODE.

English workshops cannot compete with foreigners in the making of high-class artistic furniture. The best refutation of such a baseless condemnation is the illustration on this page, which depicts a British-made reproduction of the splendid Louis XVI. commode by Riesener, one of the most beautiful objects in the Wallace Collection at Hertford House. In workmanship and finish, in the delicate beauty of the inlaid woods and the admirable sharpness of the chiselled ormolu mounts, this copy is equal to the finest example of French work. It has recently been executed specially for the Princess of Wales by Messrs. White, Allom, and Co. at their London factories, and is one of many specimens of fine British workmanship which the Princess has collected at Marlborough House. In the example the Princess thus sets of encouraging home industries, she gives a lead which might well be followed by the wealthy classes of England, in which case many orders would be placed in British workshops which go instead to the Continent, where the work is neither better nor cheaper, while our workshops at home languish for lack of encouragement.

Now that the time for fires is over for a few months, it is a good opportunity to make any alterations in one's grates if they are not satisfactory, and those who are not pleased with their hearths should go to Dover Street and inspect the collection of grates at the splendid new premises of the Well Fire Company. The Well Fire is a most perfect form of fireplace, constructed on scientific lines, giving out the maximum of heat with a very small expenditure of coal, and withal most decorative and ornamental in any room. It has the additional advantage that it will burn from ten to twenty hours without feeding or any attention whatever, and certainly no one who is contemplating new grates or the replacing of old ones should fail to pay a visit to Dover Street and see this firm's grates before coming to a decision.

Will it be said of me that women rush in where tailors fear to tread, if I positively dare to give a sketch of a masculine garment? My temerity, however, has the excuse that most of my feminine readers have masculine adjuncts, and can appreciate, therefore, vicariously the merits of the Aquascutum coat illustrated. It is a motor-coat, but would do equally well for any ordinary occasion when preparation for unpleasant weather possibilities is needed, which, in this variable climate, is the same as saying it is eminently fitted for everyday wear. The chief point in this coat, as in nearly all the Aquascutum garments, is the sleeve, which is not only roomy, but not fastened round the armhole, which it passes through from the inside, to which it is attached. This gives the most delightful freedom of movement to the wearer, and is a feature of tailoring strongly to be recommended for feminine wear as well as masculine. The cuffs, too, of this coat are worthy of notice, for they turn down and button round the wrist, if required, which is an excellent protection against wind and wet. Another admirable coat for summer wear is the Aquascutum Company's ladies' coat in a light grey Aquascutum cloth, with a large faint check in black. It is cut very full and long to cover the dress, and is loose both back and front, the trimness of outline being yet preserved by the bands that hold the coat to the figure at the sides. It, too, has the large full coat sleeve that I have described above in the man's coat.

Very good prices ruled at Messrs. Robinson and Fisher's sale of garden ornaments held at their King Street Galleries on June 1st. The principal lots sold included a very fine and elaborately carved marble armchair, 5ft. high, which realised £115; a handsome marble fountain, 6ft. high, £84; a pair of marble vases, 5ft. high, 80 guineas; a pair of marble lions, 5ft. 8in. long, 85 guineas; the celebrated well-head used in the grounds of the Foscarini family, Venetian, *circa* 1450, 45 guineas; a rare old sundial, 17in. square, £25; a pair of old wrought-iron park gates, 85 guineas; a fine old Adam balcony, the ironwork about 80ft. long, from Wimbledon Lodge, 72 guineas; and a very fine 12in. circular sundial, engraved

> "I speak not, yet you understand me well,
> I make no sound, and yet the hour I tell,"

fetched the high price of 56 guineas. Taking all round the sale was decidedly a success, and shows that good old garden ornaments are rapidly rising in value. LAMIA.

AQUASCUTUM MOTOR-COAT.

BUXTON AND THEREABOUTS.

MANY people are under the impression that only invalids go to Buxton. There could hardly be a greater delusion. Of course, it is true that Buxton has won its renown as a health resort, owing to its superb mineral waters; but as an ideal centre for the holiday-seeker, where he may count upon a constant round of amusements, and have at his very doors some of the most romantic and impressive scenery in Great Britain, the capital of the Derbyshire Peak country occupies a pre-eminent position.

Here, owing to the high elevation above sea-level, while the semi-invalid feels an immediate accession of strength begotten of the rarefied air, the robust are amazed to find that hitherto they have not known half the limits of their capacity for enjoyment. And in Buxton itself and its immediate neighbourhood there is so much to be enjoyed. The gardens alone would make the fortune of many a less favourably situated town. Chief among these, of course, stand the richly-wooded and picturesque grounds which surround the Pavilion. Here the art of the landscape gardener has done its utmost to secure infinite variety of wooded glade and seductive lawn, and the ingenious manner in which the river Wye is made now to hold a mirror to Nature's beauties, and anon to add the music of falling water to Nature's harmonies, is suggestive of the skill which the Japanese have displayed in similar creations. The serpentine walks are none the less charming because they are so different in character. There Nature has been allowed a free hand, so that between the two the visitor has within a few minutes' walk his choice of the beautiful artificial or the beautiful natural. While, too, the Pavilion gardens are naturally the most favoured resort of those whose chief pleasure on a holiday is to mingle with their kind, the serpentine walks are secluded enough to satisfy the lover of quiet meditation.

A CORNER, ST. ANN'S HOTEL.

No visitor can fail to note that the architecture of Buxton, especially in its private buildings, has a character all its own, nor can he fail to realise that that character is perfectly in harmony with the natural setting of the town. Situated, as it is, in a superb amphitheatre of the Derbyshire hills, no more suitable, dominant feature in the town itself could have been devised than the stately Crescent for which Buxton is famous. That Crescent dominates Buxton just as certainly as the surrounding hills dominate the town as a whole; and the one abiding memory of the spa which the visitor is certain to carry away with him will be of that majestic building. It has obviously set the fashion in stone for the whole town, and when the St. Ann's Well was built opposite the Crescent by the Duke of Devonshire some ten years ago, it was only natural that it should have been designed in harmony with its stately neighbour.

ST. ANN'S HOTEL.

Although erected nearly a century and a-quarter ago, the Crescent stands as solidly four-square to the elements as though but yesterday from the builders' hands. Costing some £100,000, the structure was rendered necessary by the increase of Buxton's fame at the close of the eighteenth century, and for some years it did duty as a series of palatial private dwelling-houses. To-day, however, the Crescent is practically a synonym for the famous St. Ann's Hotel, which Their Majesties the King and Queen honoured with a visit for luncheon early in the year while the guests of the Duke of Devonshire at Chatsworth. For the very reason that the Crescent was designed as a series of private houses, this hotel is quite unlike most buildings of its class—that is, it offers all the conveniences of the best-equipped hotel in combination with the comfort and privacy of one's own home. The separate entrances, which were in use when the various portions of the building had individual existence, still remain, and hence the occupants of private suites have no occasion to use the public entrances to the hotel. All the sitting-rooms are on the first floor, and have a southern aspect overlooking the terrace or St. Ann's Cliff, which is laid out in walks and grassy slopes. Moreover, there is access directly from the hotel itself to the famous baths of Buxton, which is naturally a great convenience for those who visit the town to undergo the cure.

The golf links are reputed to be a very fine inland course indeed. A new club-house has recently been erected, and the game played in such an invigorating climate has an added charm. For croquet players the big tournament in the second week in July, for which many of the best players enter, will provide much interesting sport; and in August the lawn tennis tournament attracts many of the best players in the country.

With, in addition, its new theatre, the Pavilion concert hall, and bowling greens, Buxton is amply supplied with sources of amusement for morning and evening alike, and from the beginning of June onwards, no pleasure resort in the British Isles has more to offer the visitor in variety of entertainment.

But perhaps the chief charm of the town consists in the fact that it is so centrally situated for a wealth of ideal excursions. Exquisite valleys radiate in all directions from the town, and really it matters little towards which point of the compass you walk or drive. Everywhere the scenery is unique, and everywhere are time-stained walls redolent of absorbing historical or romantic interest. Haddon Hall, for example, is less than fifteen miles away, and Chatsworth is within the same distance; and than those two famous buildings, where in England can be found such a combination of the beautiful in old-world architecture and the interesting in historical associations? For pure loveliness of dell and tumbling waters, what spot can hope to rival Dove Dale, while such as take delight in survivals of the immemorial past will find a feast of unique sensations awaiting them at Arbor Low, the Peak District's famous Druidical Temple. Also, it goes without saying, that here the pages of "Peveril of the Peak" may be read with a keen zest and enjoyment impossible elsewhere, and that from Buxton easy excursions may be made to the home of the ill-starred Brontë family at Hathersage, or to Ashbourne, where Dr. Johnson was once an honoured guest, or to the famous Pike Pool of "Complete Angler" memory.

It goes without saying that no visitor to Buxton will fail to make an excursion to the famous Peak caverns, of which perhaps the most notable is situated at Castleton. Many of the chambers in these caverns are of palatial dimensions, and the constant oozing of water through the limestone rocks has resulted in the formation of some of the most wonderful stalactites to be seen anywhere in the British Isles. In none of the caves, perhaps, is the effect more gorgeous than in the Blue-John Cavern at Castleton, where the deposits have taken the form of an enormous cascade, which, when lit up, presents a scene of glittering splendour only comparable to a vision of fabled fairy-land. Poole's Cavern, too, which is within half a mile's walk of Buxton, should not be omitted from the tourist's programme. It extends for more than a third of a mile into the limestone rock, and that it was once the abode of ancient Britons and Romans has been demonstrated beyond question by the frequent discoveries therein of human remains and numerous coins and bronze implements. To the geologist these Derbyshire caves are naturally of absorbing interest, and, indeed, it may be doubted whether there is any other district in England where the student of the rocks can hope to find a greater wealth of interesting material. Nor is the neighbourhood less attractive to the student of anthropology. Prehistoric man has left behind him here many traces of his untutored way of life, and many of the customs which still survive, such as the annual well-dressing ceremonies at Tissington, take the mind back to the grey dawn of history in the British Isles.

DINING-ROOM.

Several interesting excursions are available to the north of Buxton, notably that leading in the direction of Chapel-en-le-Frith. Near the village of Disley is Lyme Hall, an ancestral home of rare historical attraction, containing, among many other memorials of the romantic past, an oak bedstead once slept in by Edward the Black Prince. To the east of Buxton lies the ancient town of Bakewell, where the earthworks of a fort constructed by a son of Alfred the Great may still be traced. Although largely restored some sixty years ago, the church at Bakewell contains much of historic interest, notably the Vernon Chapel, the burial-place of the old-time owners of Haddon Hall.

Among the numerous other attractions of the surrounding district, the tourist should make especial note of the village of Edale, situated in one of the most exquisite of all the Derbyshire valleys, and Eyam, that quaint old-world village which was the scene of the memorable heroism of its rector and his wife in the Great Plague of 1665. It may be inferred from the foregoing, which is indeed the case, that the visitor to Buxton need never lack an interesting objective for his walks or drives. Nature has here been so lavish with her best gifts, and man has left so many assertive memorials of his history, that the choice of where to go and what to see is the only problem demanding solution.

CRICKET NOTES.

THE first of the Test Matches has ended in a splendid victory for England. Never before has a Test Match, played on an exceptionally hard, true wicket, furnished so many surprises as the one recently fought out at Trent Bridge. Jackson, having won the toss, decided to take first innings, and when, at 11.30 a.m. on Monday, May 29th, Darling led his men into the field, the spectators settled themselves down in the full expectation of seeing a fine display of batting. What they did see, however, was the dismissal of five such batsmen as Hayward, A. O. Jones, F. S. Jackson, A. C. Maclaren, and G. L. Jessop for a total of 11. When the Australian fast bowler seemed to completely demoralise the defence he was sending the ball down at a tremendous pace and in the most erratic fashion, and Laver, at the other end, was bowling in the most admirable style, keeping a beautiful length, and varying his pitch and pace without any apparent change of action and with the greatest judgment. But good bowling is to be expected in a Test Match, and it seemed impossible to believe that five such bats could have been got rid of, three of them clean bowled, for such a paltry score. How it happened no one can tell, and it must be added to the list of the glorious uncertainties of cricket. The same bowlers were on when Tyldesley came in. Cotter was just as fast and just as dangerous, but his deliveries did not seem to frighten Tyldesley, small as he is in stature, and for two hours he kept his wicket intact, thereby rendering a service of inestimable value to his side.

One cannot help hoping that in future, no matter how the game may be going, the spectators will refrain from giving vent to their feelings by jeering at the players. It may be irritating to them to see a bowler persistently bowling off the wicket, they may disapprove of a style of bowling which appears to be aimed more at the person of the batsman than the stumps, and certainly Cotter's bowling was of the most erratic description; but the same applies to not a few of Jessop's deliveries as well. Armstrong was the subject of such persistent insult that he was justified in refusing to continue bowling until the crowd recovered their temper and their manners. He was presumably obeying orders in bowling as he did, and, after all, it should be remembered that the main object of the captain of a side is to win the match—not merely to provide amusement for the spectators.

The fielding of the English team was as a whole considerably above the average; so much so that the Australians found it extremely difficult to pursue their usual policy of stealing runs. Jessop in particular by the brilliancy of his fielding saved many runs for his side, and did much to redeem his complete failure to judge the ball from Laver which dismissed him in the first innings. Jackson showed himself to be a cool, skilful, and unselfish captain of the team, which, under his leadership, pulled itself together and turned what looked like defeat into a brilliant victory. Maclaren's score of 140 in the second innings was a most masterly exhibition of batting, hardly ever at fault. He placed the ball with wonderful precision, and punished the bowling severely whenever there was the slightest opportunity to do so. The turning point of the game was probably the sensational over sent down by Jackson, in which he got rid of Noble, Hill, and Darling.

Bosanquet may well look back with legitimate pride upon his share in England's victory. He and Tyldesley were the first two batsmen to stop the "rot" that had set in, and his bowling in the second innings of the Australians was simply beyond all praise; how he does it no one knows but himself. Most of his bowling appears to be simply rubbish; length is an unknown quantity to him, but he manages to puzzle and beat the finest batsmen in the world, and on this occasion in particular he excelled himself in the deceitful spin and break which he got on the ball. Owing to the unfortunate accident to Trumper there were but nine wickets to take, and eight of them were taken by Bosanquet.

Towards the end of the game the light became very bad, and one cannot but admire the generous action of the Australians in not claiming a cessation of the game on that account. They would have been perfectly justified in making such a request, and had they done so it is more than probable that they might have staved off defeat. So bad was the light that from the Press box it was impossible to make out the figures on the scoring-board. The crowd were not slow to recognise the true sportsmanlike behaviour of the losing side, and they gave Darling a special ovation in consequence.

In the Warwickshire and Lancashire match the stand made by J. F. Byrne (222) and Kinneir (158) for the first wicket was an omen that a draw was probable, and so it proved. Other good individual scores last week were Braund's 130, which helped to win Somerset's match against Gloucestershire, and Captain J. G. Greig's double century for Hampshire. This gentleman is making good use of a short furlough to write his name large on the cricketing annals of the year. E. M. Sprot and G. N. Foster, in the same match, made 141 and 152 respectively. In fact, all through the week scoring ruled so high that it is impossible to mention all the feats performed with the bat.

No Country House is complete without a supply of

HORLICK'S MALTED MILK

THE IDEAL FOOD-DRINK.

It contains more pure nourishment than any other preparation, and is more easily digested and assimilated.

It is prepared immediately by simply stirring in water, and is invaluable to ATHLETES, MOTORISTS, CYCLISTS, TRAVELLERS, and all who require sustaining, stimulating, and easily-digested nourishment which can be enjoyed at a minute's notice.

THE DAILY USE OF

HORLICK'S MALTED MILK

MEANS INCREASED HEALTH, STRENGTH,
STAMINA, VIGOUR,
MUSCLE, BRAIN and NERVE POWER.

A leading PHYSICIAN writes:—

"I can conscientiously recommend Horlick's Malted Milk to medical men and the general public."

Horlick's Malted Milk can be obtained of all Chemists, Grocers and Stores, price 1/6 and 2/6.

A free Sample will be sent to every applicant mentioning this publication by

HORLICK'S FOOD CO., 34, FARRINGDON ROAD, E.C.

RACING NOTES.

ON more than one occasion in these notes attention has been drawn to the excessive charges exacted from owners, trainers, and breeders of race-horses by the railway companies and race-course executives, and a hope was expressed that the subject would be dealt with in a broad-minded and liberal fashion by the directors of the great railways. There is no reason to doubt that this will be done, especially as, by their approval of the memorial addressed to them on the subject by Lord Carnarvon, the Jockey Club have thrown the weight of their influence into the scales on the side of the racing public; at the same time, the Jockey Club wisely decided that, as regards the charges for stabling and other kindred expenses at race-meetings, they consider it to be a matter for the individual consideration of managers of race-courses. It is with much satisfaction that one learns that active steps have now been taken to form an Association of Owners, Breeders, and Trainers, which will be able to give voice to the general opinion of its members, and a general meeting is to be held at the Grand Hotel at 11.45 a.m. on Monday, the 19th inst. The Provisional Committee which has already been formed includes the names of Lord Rendlesham, Lord Carnarvon, Lord Marcus Beresford, Lord Hamilton of Dalzell, Messrs. W. Bass, James Buchanan, George Edwardes, L. E. B. Homan, Edmund Lamb, Francis Luscombe, G. A. Prentice, George Thursby, Captain Bewicke, W. M. G. Singer, John Porter, and H. Randall. The rules are being drafted, and a circular will shortly be issued inviting owners, breeders, and trainers to join the association. It is earnestly to be hoped that all concerned will strengthen the hands of the committee by becoming members as soon as possible.

W. A. Rouch. *CICERO IN THE PADDOCK.* Copyright

On Tuesday, the 30th ult., the vast army of race-goers commenced their annual pilgrimage to Epsom for the Derby Week. There was but little animation about the proceedings on the opening day, but the Woodcote Stakes, which has now been established for close on 100 years, and is the first valuable two year old race of the year, has always a strong attraction for old-fashioned race-goers. Many animals of the highest class have been returned as winners of this race. Dundee won it in 1860, and in 1862 Lord Clifden came home in front of fifteen competitors. In 1866 that brilliant mare Achievement was the winner. Sunshine, whose descendants have been so valuable at the stud, won in 1869, the year after Belladrum's victory. Cremorne and Cantinière were the respective winners of the Woodcote in 1871 and 1872, and coming down to recent years we find Toddington in 1900, Sceptre in 1901, Rock Sand in 1902, and last year Cicero gained the prize over the last six furlongs of the Derby course. One of the first items of news on reaching the course on Tuesday was to the effect that owing to a strained suspensory ligament Vedas was scratched for the Derby. Then one came across Denman, upon whose shoulders rests the heavy responsibility of training M. E. Blanc's horses, and well he might look anxious, for although it was the eleventh hour he did not know whether Jardy, the hope of France, would be well enough even to start for the great race on the morrow, and he had, moreover, had but two days previously seen the French Derby won by a horse drafted out of M. Blanc's stable, knowing at the time that he had five horses at home, any one of which could have beaten the winner had it not been for the unforeseen epidemic whose malign influence had wrought such mischief amongst the splendid horses in training

GILLOW & COMPANY

Waring and Gillow, Limited

406-414, Oxford Street, London, W.

Within two minutes of the Wallace Collection.

Those appreciative of the highest forms of Decorative Art are invited to visit Gillows' Galleries when in Town. In no way can the possibilities of high-class decoration be so easily realised as at Gillows', where the experience and resources of two centuries' existence are allied with the most modern methods.

Examples of simple and inexpensive furniture will be found equal in construction and purity of design to their more important prototypes.

BEDROOM SUITES from £30. SIDEBOARDS from £20.

CATALOGUES, AND PAMPHLET "BUSINESS METHODS APPLIED TO FURNISHING," WILL BE SENT ON APPLICATION. BOTH ARE INTERESTING; THE LATTER EXPLAINS HOW EXPENDITURE MAY BE KEPT WITHIN THE DESIRED LIMITS AND "EXTRAS" AVOIDED.

at La Fouilleuse. Well, these things are the fortunes of war, and Denman has, at all events, the consolation of knowing that he has done his best, than which no man can do more.

Otto Madden had a comfortable winning ride on Mr. G. Thursby's Aggressor in the Craven Stakes, and was followed home at an interval of three lengths by Laughing Gull, who finished a length in front of Fleta. Then came the Wallington Plate, which brought grief and disaster to the majority of backers, few of whom could have entrusted their money to the winner, Sophron, who started at 10 to 1, and won in hollow style by ten lengths from the favourite, Nell H., and The Rouken filly. It is somewhat curious that when Sophron was put up for sale at Kempton Park it was persistently rumoured that he was a "mad horse," and that nothing could induce him to face a starting-gate. It may, perhaps, have been in consequence of these reports that no bid was made for him at the time, and in all probability they had not a little to do with the remunerative price at which he started for this race. What Crusader might have done one cannot say, for Sophron landed him such a kick that he took no part in the race; a somewhat similar fate befel Evie, who, after showing a great deal of temper, eventually fell over the rails when the barrier went up. Higgs, who was riding her, was very fortunate to escape without injury. There was nothing to complain of in the field which turned out for the Norbury Plate; the recent performances of Caro were by no means calculated to inspire confidence, but he rewarded his backers by behaving in the most exemplary fashion at the start, and winning easily from the favourite, Song Thrush, who was followed home by "Mr. Jersey's" Maria, a game and consistent tryer, whose chief demerit is that the handicappers have unfortunately conceived the notion that she is a better animal than is really the case.

W. A. Rouch. *THE FINISH OF THE DERBY.* Copyright

A look at the candidates for the Woodcote Stakes in the paddock showed Norman Mint to be much improved since Lincoln; she has every appearance of a really racing-like filly, and I can but think that she should before long win a good race for Mr Homan. Black Auster, on the other hand, has not come on at all since Newmarket. He is a big, lengthy, powerful colt, and the hard going at Epsom cannot have been very suitable to him. Alcanzor, the recently-named colt, by Sainfoin out of St. Aida, has already been described in these notes. He ran very disappointingly when it came to racing, and, probably owing to his queer-looking pasterns, he did not relish coming down the hill. Serenata, a beautifully-bred filly by Chevening out of Meldola, upset all calculations, and starting at 8 to 1, was returned as the winner of the Woodcote Stakes for 1905, beating Black Auster in a canter by four lengths, with Gals' Gossip third, two lengths away. Mr. G. Edwardes likes to win a race at Epsom, and he did so on this occasion with Country Boy in the Ashtead Plate. Some speedy horses came out for the Egmont Plate, for which Blowing Stone started at 10 to 1, jumped off when the tapes were released, made the whole of the running, and won a very pretty race by a neck, having successfully stalled off a half-hearted challenge from Sermon, who appears to be steadily deteriorating. The Epsom Plate, the last race of the day, was won by the South American-bred horse Charcot, by Gay Hermit out of Nesta, who is, I believe, the only instance of a horse having won races in three continents—South America, South Africa, and now in Europe. It had been anticipated that the race for the Derby would be, if not quite a fiasco, at all events one of the most uninteresting on record; but the event proved it is never safe to prophesy. At one time it had appeared to be almost a certainty that there would be but five or six starters for the great race of the year; owners, however, at the last moment plucked up courage, and nine horses actually took part in the race. The paddock was crowded with people anxious to see the French champion Jardy, who

Modern House Decoration.

Hall's Sanitary Washable Distemper

Hall's Distemper is now the popular wall decoration in all good class houses. It is more artistic and cleaner than wall paper or paint, and saves 40 % of the cost of labour.

Hall's Distemper is applied with a whitewash brush and dries with a uniform surface, superior in appearance to flatted paint. It sets hard, is unaffected by heat or damp, does not crack or peel off, and is washable.

It contains no lead, and therefore does not turn black with age. Made in a wide range of 70 colours, which do not change or fade.

Free Sample with particulars from Sissons Brothers & Co., Ltd., Hull.

London Office—199 B, Boro' High Street, S.E.

CAUTION.

See the name **Hall's Distemper** *on all Tins; and refuse inferior imitations.*

W. A. Rouch. KOORHAAN LEADS THE CANTER FOR THE OAKS. Copyright

did not make his appearance until a short time before the race; when, however, he marched into the paddock through the little gateway from the Durdans, even the staunchest admirers of Cicero began to pause and take heed, for there was no getting away from the fact that, illness apart, he had, as far as looks went, made wonderful improvement since the day when he won the Middle Park Plate. Grown, thickened, and furnished, the son of Flying Fox and Airs and Graces looked what he undoubtedly is, a thorough race-horse from head to heel, but the total absence of bloom from his coat showed only too plainly that the horse was not himself; and anyone who has suffered, as most of us have at times, from a bad feverish cold, can imagine for himself the difference that it would make if called upon to run for one's life. Cicero had crowds of admirers, and he stripped a perfectly trained specimen of a robust and vigorous race-horse of the highest class. Rouge Croix, of whom I had formed a great opinion in his two year old days, was somewhat of a disappointment; he does not seem to be going the right way, and is not putting on muscle as one would wish him to do. Signorino, on the other hand, has come on tremendously since his last outing, and his owner, Chevalier Ginistrelli, may well feel proud of the condition in which his colt was sent out to do battle. Silver Streak is a useful animal, no doubt, but was outclassed. Liao looked well and went well, but Golden Measure is a little out of place in "classic" company. Little time was wasted at the post; Liao was quickest away when the barrier went up, and was followed by Cicero in the centre, Silver Streak, Signorino, and Shah Jehan. As soon as they settled down, Jardy, who had been drawn almost on the outside, strode to the front to take his place, which he did without the semblance of an effort, but, probably on account of the debilitating illness from which he had been suffering, was steadied back, and Liao, Rouge Croix, and Silver Streak took up the running; so they ran with little change until, as they swung round Tattenham Corner, Rouge Croix for a few strides ran up to the leader, but died away almost immediately. Cicero, Silver Streak, Jardy, and Signorino were all within striking distance, and as they made the line for home Cicero came round on the outside and cleared his field. "Cicero! Cicero!" was shouted, but the end was not yet; first Signorino challenged, and then Jardy. On they swept, and Jardy got to Cicero's girths; for a few strides he gained yet a little more. "The Frenchman wins!" "Jardy does it!" A moment or two of intense excitement. The winning-post is close at hand. Jardy can do no more. Signorino has shot his bolt, and by a bare three-quarters of a length Cicero has won the Derby for Lord Rosebery from Jardy, who just beat Signorino by a head for second place. To the victor the laurels, but honour to the vanquished. The race was run in 2min. 39 3-5sec., and short of work and suffering from a debilitating illness, Jardy was only just beaten in the fastest Derby on record.

A sad gloom was cast over the Derby Day by the fatal accident in the Juvenile Plate. The Braw Lass filly, ridden by Evans, came down just after crossing the road, bringing with her the Childhood filly, ridden by Murray. The field swept on, followed by the riderless horses. Murray, sadly shaken, staggered to his feet, but poor little Evans was injured beyond all chance of recovery, and in a few brief seconds all was over. Quiet, steady, and unassuming, the lad was very popular, and thoroughly esteemed and respected by all who knew him.

The sport on Thursday afternoon was quite in keeping with the promise contained in the programme, which included four events of 1,000 sovs. each, and further *éclat* was given to the proceedings by the presence of such brilliant race-horses as Pretty Polly, Delaunay, and Zinfandel. Anniversary II. had not much difficulty in winning the Great Surrey Foal Stakes for Lord Derby, and administered a two lengths beating to Frusquinette, who finished a length in front of Medelstone. The winner is, I think, the first one got by Diamond Jubilee. Zanoni showed that there is still a race in him, and he wore down His Lordship in capital style in the Riddlesdown Selling Plate. Delaunay, although beaten in the Royal Stakes of 1,000 sovs., ran a magnificent race, probably the best of his life. A quarter of a mile from home he was leading; a little further on Thrush (7st. 8lb.) delivered a determined challenge; but the big horse shook it off. Hardly had he done so, when Golden Gleam (6st. 8lb.), vigorously ridden by Plant, attacked him on the other side. Right gallantly Delaunay responded; but weight told its inevitable tale. Inch by inch they struggled on, and it was only by the shortest of heads that the 10st. carried by Delaunay brought about his defeat.

The Coronation Cup, value 200 sovs., with 1,000 sovs. added to a sweepstake of 20 sovs. each, brought out only three horses, but the three were a host in themselves—Pretty Polly, Zinfandel, and Caius. The

famous mare, accompanied, as usual, by her friend the cob, was walking about in the paddock with all her old dignity and sedateness, and has even gained in appearance since last year. As powerful and muscular as ever, she has fined down in her forehand, and is, taking her altogether, an almost perfect specimen of equine symmetry and perfection. Everyone expected to see her win, but as the three champions wended their way to the Derby starting-post, few could have expected the astonishing display they had in store for them. Caius jumped off with the lead directly the barrier went up, and made the running at a terrific pace, followed by Zinfandel, with Pretty Polly last. On they went, with the pace becoming faster and faster. So they ran till coming into the straight, where Zinfandel closed up with Caius, who was beginning to feel the effects of his exertions For a few strides they swept on side by side, when, with a tremendous burst of speed, Pretty Polly flew past them without an effort, and striding along in the most perfect style, won as she liked by four lengths, in 2min 33 4-5sec., beating the fastest previous time in which the distance had ever been covered by nearly 6sec. Unruffled, cool, and collected the flying mare walked composedly back to the weighing enclosure amid round after round of enthusiastic cheering. After such a race as this, the rest seemed tame. Mr. E. Hibbert's filly by Cyllene out of St. Donatts beat a numerous field in the Horton Selling Handicap, and the three placed horses in the Durdans Handicap of 1,000 sovs. were Donnetta, Ambition, and Sir Daniel.

The "Fillies' Derby" on the following day did not seem to excite as much interest as usual, and as to the race itself there is little to be said, for Mr. W. H. Hall-Walker's Cherry Lass won as she pleased, and cantered home four or five lengths in front of Queen of the Earth, who relegated Amitié into third place by six lengths. The winner is by Isinglass out of Black Cherry (3). The pedigree is extremely interesting, and is a striking testimony to the value of the Bruce-Lowe theories. Cyllene had yet another winner in the shape of his daughter, the aptly-named Cythera, out of Stolen Love, who won the Acorn Stakes of 1,000 sovs. for Sir E. Vincent, beating Gemma and the St. Simon out of Splendid filly and eight others. Mr. E. Carlton's Corœbus scored his second victory at the meeting in the last race of the day, but it was only after a tremendous finish that he managed to get up and win the Belmont Handicap Plate by a short head.

Never has a more brilliant meeting been brought to a conclusion on Epsom Downs, but there are one or two matters in connection therewith that seem to call for comment which cannot be altogether favourable. The precautions taken to ensure the safety of the going in crossing the tanned roads appear to be quite inadequate. More than one of the leading jockeys, I understand, have complained of the danger to riders from this cause, and the two accidents at the recent meetings, one of which was unhappily attended with fatal results, would seem to confirm their complaints. Tan is at best a bad material to use for covering the roads; the sudden change of colour from the green of the sward often inclines horses to try and jump the brown streak in front of them. If tan must be used, it certainly ought to be spread for such a distance on each side of the road that the horses would not attempt to do so; but there are better materials for the purpose, and it goes without saying that, where life may be endangered, no expense should be spared to minimise the possibility of accident. The arrangements made to ensure a free course for the horses in the Derby were by no means all that one could have wished to see. No steps were taken to prevent the crowd from surging on to the course in the neighbourhood of the starting-gate, and a quarter of a mile from the start there was scarcely room for the horses to gallop. This is a matter of some importance, and is so easily remedied, that it is to be hoped that what is evidently a mere oversight on the part of the officials may be put right before another meeting comes round. TRENTON.

THE LADIES' GOLF CHAMPIONSHIP.

THE 1905 championship, which was played at Cromer in a week of almost perfect weather, resulted in a win for Miss Bertha Thompson, who beat Miss M. E. Stuart by 3 up and 2 to play in the finals, the bronze medallists being Mrs. F. W. Brown and Miss D. Campbell. The meeting was one of exceptional interest, bringing forward quite a new set of players. With the exception of Miss D. Campbell, who was bronze medallist last year at Troon, none of the players had previously reached the final stages of the contest. The record entry of 137 competitors adds lustre to the victory of the winner.

A GOOD FINISH.

Miss D. Campbell was the winner in the preliminary score competition with the fine return of 82, and Miss Glover and Miss Florence Hezlet tied with 86 for the second and third prizes, Miss Hezlet winning the tie with 84 to Miss Glover's 85. As usual, there were many surprises in the tournament, one of the greatest being the victory of Miss M. E. Stuart over the twice champion, Miss May Hezlet, in the third heat, both ladies coming from Portrush, where they have often been opponents, as well as in the Irish championship, which Miss Hezlet so recently won. After this it was not so surprising that Miss Stuart beat

THE WINNER DRIVING.

BARNET ORTHO PLATES & BIRD PHOTOGRAPHY

Gannets on Nest with Young. Chas. Kirk, Photo.

Copy. 156, Sauchiehall Street, Glasgow.

Messrs. ELLIOTT & SONS, Ltd., Barnet. May 9th, 1905.

Gentlemen,—With reference to my book of bird photographs, I have great satisfaction in stating that most of the negatives were made on Barnet plates, and since the introduction of the "Barnet Orthochromatic Plate" a new power has been placed in the hands of those who specialize in the photography of living wild birds. I have always found these plates of sufficient rapidity—even for focal plane work—giving good rendering of colour values without the use of a screen and in every way to be highly commended to the naturalist photographer.

Yours truly, (Signed) CHARLES KIRK.

MISS B. THOMPSON, CHAMPION, 1905.

Miss M. Maitland, who had just beaten that fine player, Mrs. R. Kennion. That Miss Fennette Smith should defeat the Scottish champion, Miss M. A. Graham, was also unlooked for, although she did well last year at Troon. Miss Lloyd Roberts was another young player to come forward, playing a very strong game and beating the American champion, Miss Bishop, and the Hon. Lois Yarde Buller before she was put out by Miss F. Hezlet by a putt on the last green. Miss M. B. Adams and Miss M. Curtis did the best among the American visitors, and reached the sixth and fifth heats respectively. The driving of all these ladies is their strong point, and though they visited England with the view of finding out how they stand with the players in this country, rather than with any idea of carrying off the championship, they have proved themselves first-class golfers and delightful opponents, and have gained many friends and admirers; and with the exception of Miss H. Curtis, who was put out by her sister, they have only been defeated by really good British players. Miss Steel played a strong game, but had easy matches until she met Miss Thompson in the sixth heat, when she was only beaten at the twentieth hole. Miss Florence Hezlet had one easy match, but could only win against strong opponents at the eighteenth hole for her next three matches, and was beaten as narrowly by Miss Campbell in the sixth heat, so that, on the whole, she had the hardest place in the draw. Miss Titterton did well to beat Miss Glover, but it took her until the twenty-first green was reached before the match ended. Miss E. C. Nevile again disappointed her admirers by succumbing to Miss Campbell in the fourth heat, after beating Mrs. G. Hunter, who in her turn had disposed of Miss Griscom, ex-champion of America and a fine player, whom she beat on the last green. Of the last four, two represented Scotland, one England, and one Ireland, and the matches showed as high a standard of excellence as could be desired. In the semi-finals the match between Miss Thompson and Mrs. Brown was closely contested, and at one time the latter had the lead of two holes. The Yorkshire champion was, however, equal to the occasion, and winning five holes in succession, won the match on the seventeenth green. Miss Stuart and Miss Campbell also gave a good display, but the Scottish player lost on the greens, so that the Irish lady claimed the victory at the sixteenth hole. The finals between Miss B. Thompson and Miss M. E. Stuart were followed by a comparatively small but keenly attentive crowd, who were rewarded by an excellent match. Although Miss Stuart never got the lead, her game was at times remarkably brilliant, as she took three successive holes in three each, and putted with deadly accuracy. Miss Thompson's short game was practically faultless, if at times she was behind her opponent in the drives, and when Miss Stuart visited the bunker at the sixteenth hole, the match and the championship fell to Miss Bertha Thompson, a victory which could not have been improved upon for popularity. It was unfortunate that last year's champion, Miss Dod, was not playing her best game, but she was only defeated by Miss Thompson in the fourth heat at the sixteenth green, and will no doubt be in better form by next year.

PUTTING AT THE FOURTEENTH GREEN.

MISS CAMPBELL IN THE SEMI-FINAL.

Much gratification was felt by the visitors at the hearty reception they received from the members of the Cromer Club, and at the delightful weather which lasted throughout the meeting.

SHOOTING NOTES.

The Problem of Winged Vermin.

In "Country Notes" of June 3rd some account was given of a mode of capturing jays, magpies, and hawks which was advertised in a sensational manner. The stuff was, in effect, bird-lime, though advertised under another name, and was intended to take the place of the pole-trap, now illegal. The advertisers were successful in irritating two classes of public opinion, the humanitarians, and those who, while interested in sport, wish to see a fair percentage of the larger predatory birds left. The humaner reader was "put off" by the suggestion that, if the limed jay or magpie is left to "crawl about" after being well rubbed over with glue, others will attack it and be caught in the same way. The second and more general consideration is involved in the use of the stuff at all. Anything which sets public feeling against game preserving carried on with sense is a real misfortune to ornithology, because it can be proved that the great game estates are now the homes of a far larger and more interesting bird population than any other. The increase of the harmless birds enormously counterbalances the decrease of a few "nozful fowles," as they are called in the Elizabethan Acts of Parliament, and even these are, in most instances, only kept in due bounds. It has been proved by experience that, except the carrion crow, the magpie, and the harriers and buzzards, winged carnivora reappear in almost exactly the same numbers on an estate every year. The only serious mischief they do is from March till the middle of July, when it is very inadvisable to let them nest near a preserve or lake. Buzzards do no harm at all, and the large harriers are carefully preserved if ever they do appear. What is needed is the exercise of good sense and good taste. Some birds must be kept in check—not "extirpated"; others should never be touched. In this respect the question arises, How is the check to be exercised? The choice is between shooting, which is noisy and difficult, the use of the gin, which is very cruel, and some stuff like the "Snarglu," advertised on the lines which have raised so much resentment. As traps, besides being cruel, are also liable to catch and maim some other bird, the use, not the abuse, of birdlime seems rather a humane alternative. There is always a sale for jays as cage birds, so they need not be killed if thus captured.

Destruction of Merlins on the Northern Moors.

That beautiful little falcon, the merlin, the smallest of all our "raptors," leaves England generally in the winter, though it stays late in Ireland, and returns in the late spring to nest on the grouse moors. It is quite common on most moors in both Yorkshire and Westmoreland, and in Cumberland, and probably on the Lancashire Pennines. That is to say, on a breadth of moors of 20,000 acres there will, perhaps, be five nests. The birds are so small that they can do no harm whatever, except, perhaps, to "cheeper" grouse just beginning to fly, and are so few that they can make no difference on a moor. Almost their sole prey are the pipits or titlarks, which abound. There are few other small birds on the moor tops. Unfortunately, in a big grouse drive (or a small one for that matter), the appearance of any hawk is apt to cause trepidation in the bosoms of the grouse, and sometimes puts a pack wrong. To avoid this, on many moors the keepers trap or shoot every local hawk, including the kestrels building in the crags. A big hen kestrel is, no doubt, alarming to grouse, but a little merlin can cause very slight alarm, and there seems every reason why the keepers should be ordered to leave them and their nests alone.

Otters and Young Wild Duck.

An Essex correspondent writes to ask whether otters kill young wild duck. The writer owns a large lake on which there are usually numbers of young wildfowl at this season swimming about with their mothers, but this year there are almost none. On the other hand, otters, which have always lived round the lake, have increased and now number six. The lake is beautifully stocked with bream and other fish and pike. Perhaps some of our readers will say whether in their experience otters kill young wild duck. They are cheerful animals, with a certain amount of devilry about them which might induce them to do so for mischief's sake. But we have seen no evidence that they do. On the other hand, this is a shocking year for young wildfowl generally in the Thames watershed. We have seen lake after lake with hardly a young bird on it. Even the waters in St. James's Park and Richmond Park, where the young are exceptionally well protected, are almost devoid of young ones.

Quails and Landrails.

Of our two "overseas" game birds, the quail and the landrail, the former has become very much more scarce than it was. It never was common, but there were many counties, or parts of counties, where two or three quail were expected to form part of the bag in a day's September partridge-shooting. Complaints are general in France, where quail were formerly the main game found in September, that there are not nearly so many as there were. Probably the increased destruction of them during migration—when millions are killed—accounts for the falling off. If it is desired to find out whether there are any quail about, go out about seven o'clock near the cornfields in August. The bubbling note of the cock quail, unlike that of any other bird, is certain to be heard if any are near. Berkshire, Hampshire, the Oxford Downs, and Sussex seem to be the headquarters of what quail still visit England. Young quail shot in September are almost, if not quite, as great a delicacy as the other migrant game bird, the landrail. The latter has not yet recovered its numbers since the terrible June of 1903, when probably half the eggs in England were rendered infertile. But though a few landrails, shot out of the clover or thin barley in September, make a very elegant addition to the table, they give no sport, owing to their skulking habits and slow flight.

Stoats in Hollow Trees.

Speaking of the egg-stealing feats of rats, mentioned in a recent article on rearing wild ducks, a correspondent writes from Essex: "One of our keepers noticed that a young stock-dove in a nest in a hollow tree in the park had been killed by some animal, so he set a trap and caught a stoat. He reset the trap, leaving the stoat's body near, and, to make a long story short, he caught nine, one after another." The number is no reflection on the keepers, for there are other properties close to the park; but it goes to show how fond stoats are of hunting for prey in hollow trees. In spring at least a dozen different kinds of birds nest in these, while both rabbits and rats haunt the roots and lower stems; consequently the stoat finds plenty of "game" and eggs there. We note that last week there were found in the earth of a vixen with cubs two partridges, two pheasants, a wild duck, and more than thirty rabbits. With so many rabbits obtainable the vixen might have let the birds alone. But as one of George Eliot's characters says of the dog with puppies which stole his luncheon, "What's the use of expecting a conscience in a mother with babies?"

Osier Coverts.

The swift growth of the osiers at this time of the year, as they spring up from the "stools" down to which they were cut in January or December, is a reminder of the excellent and fast-growing cover made by osiers for pheasants. Just after they are cut, the bare osier-bed must afford a great deal of early insect food, to judge by the persistent way in which starlings hunt them, while grasses and many succulent plants grow there earlier than anywhere, and give the pheasants that vegetable food which their systems need in early spring. Another useful function of osiers is that they drink up with great avidity any form of liquid drainage. An osier-bed is invaluable on the small "sewage farm" now so frequently annexed to a country house and farmery where there is no system of main drainage.

Teals' Eggs.

A correspondent writes asking how teals' eggs may be obtained with a view to setting them. It is too late for this season, as teal have already hatched their young, or are about to do so. There is no doubt that any-

one who made it a matter of business to keep teal like wild ducks for laying purposes would find any number of purchasers for the eggs. The difficulty of rearing young teal was explained in an article last year from information kindly supplied by Sir R. Graham. The little birds always hide when brought up by the old teal, and it was found much better to put the eggs under a foster-mother in the shape of a small "decoy-duck." But this is only the second difficulty. The first is to obtain eggs, let us say for next season. If any of our readers can suggest how this can be done it would be much appreciated. At present the only satisfactory method seems to be to correspond with owners of properties in Ireland where teal are plentiful and not thought much of, and offer to exchange hen pheasants' or pheasants' eggs for teals' eggs. They are said to travel badly, just as grouse eggs do. Another plan would be to write to the owner or manager of a decoy where teal are regularly caught and sold, and offer to buy live teal caught in the winter. Possibly Orwell Park Decoy near Ipswich (decoy-man, G. Skelton), or the decoy-man at Fritton Decoy, near Lowestoft, can give information on this head. The increase of teal is very much to be desired, and anything which will properly further this increase merits encouragement. It was found at Netherby that it was far better to set eggs laid by birds the parents of which were wild rather than to rear from eggs laid by wild birds.

BENCHES FOR PHEASANTS' EGGS.

Pheasants' eggs, when picked up, need to be left to "settle" for period, the duration of which is variously estimated, before being set under the hens, though they need turning over daily, or very frequently, as the hen pheasant would do this in any case. Usually they are laid in earthenware pans full of bran. The bench shown, in which the eggs are placed on earth, is simpler and cheaper.

POACHING DOGS.

Shooting a dog, even when in the act of destroying game, is a course never to be advised. In nearly every case the owner, however often he has been convicted of poaching, and however obvious the fact that the dog was poaching, gets a considerable sum in damages and costs against the shooter of the dog. But we are glad to see that it is not ever thus. Near Paignton, in Devon, a farmer had been endeavouring to get up a head of hares, partl

PHEASANTS' EGGS "SETTLING."

for the Britannia boys' beagles to hunt, and had paid as much as £1 apiece for female hares. One night at 8 p.m. he found a "party," who admitted two convictions for poaching, with two lurchers, the man, as is usual in such cases, being on the road. It was alleged that the dogs were both in one of the farmer's fields, and that they jumped thence into the road, that the man refused to give his name, and that the farmer then said he should fetch his man and tell him to shoot the dogs if they came on to his fields again. This was at eight o'clock at night in November, when the owner of the dogs declared that he "was taking them out for exercise." The "man" was fetched, and brought a gun, when the dog exerciser was found in the road with only one dog, the other being engaged in taking exercise in the fields. There it was summarily shot, and an action was brought in consequence. The servant who shot it swore that it was actually coursing a hare. The shooting was admitted. The judge, His Honour Judge Lush Wilson, K.C., gave a common-sense decision. He said that the dogs were of a kind bred to chase and catch game in a manner not used in ordinary sport; that the plaintiff must have contemplated that if taken out for exercise at 8 p.m. they would take this in the natural way by pursuing game, and that he persisted in taking the dogs there after being warned. Basing his view on Lord Ellenborough's decision, that the defence was a good one in law in view of the game chased by the dog being in imminent danger of destruction, he gave a verdict for the defendant.

NOT A PRECEDENT.

In the case in question this was both law and sense. But it must not be supposed that it is safe or wise to shoot a dog chasing game as a rule. It might be a valuable animal, the property of some gentleman or lady, which had got out of hand; or, again, there might be, and nearly always is, the greatest difficulty in proving that the game was in "imminent danger." A County Court summons for damage is far less risky and more effective.

CORRESPONDENCE.

MONGOLIAN PHEASANTS.

SIR,—Those of your readers who are acquainted with the appearance of the splendid Mongolian pheasant (P. Mongolicus) may be interested in hearing of the continued prolificacy of these birds, and the high degree of fertility of their eggs. Up to the evening of June 2nd, not counting some eaten by jackdaws and rooks, they had laid 417 eggs. As I had fourteen eggs from fifteen hens one day this week, I do not think that the supply is likely to fail for some time. Over fifty of the pure chicks have so far been hatched, and infertile eggs have been extremely rare. The name "The Yellow Peril" bestowed upon some chicks in an illustration in your article of last week is a peculiarly happy inspiration, seeing that the pure Mongolian chicks are very golden yellow in hue. To the list of the many virtues of the Mongolian pheasant allow me to add his (in my experience) extremely peaceable disposition. So far as I have discovered, this bird has not a single vice: Out of twenty-eight cocks one only proved an egg-eater, and but one a wife-beater. I may, with your permission, add that it is at all times a pleasure to me to show my birds to sportsmen who are interested in rare and beautiful pheasants, and to facilitate inspection of them in every way within my power.—CHARLES E. M. RUSSELL, the Mongolian Pheasantry, near Hythe, Kent.

LITERARY NOTES.

WE must confess to feeling considerable sympathy with the man who is able to forge antiquities so as to deceive "the very elect." To do so requires considerable knowledge of archæology, great skill in manufacture, greater in getting up and knowing what to imitate, and if the rich collector, who thinks that all that is wanted to prove him an archæologist is a long purse, with which to acquire a collection and the right to add F.S.A. to his name, is done by the forger, our sympathy goes out rather to the latter. That forgeries are numerous goes without saying. If the primæval inhabitants of these islands could come to life again and see all the weapons and articles they are said to have made, probably no one would be more astonished than themselves, and they might remark that they had during their lives other employment than making objects for future collectors. A history of modern forgeries that have been passed off on collectors, and which still hold pride of place in some collections, would be a most interesting and instructive book.

When we took up Dr. Munro's volume, we hoped to find in *An Antiquary's Book* some hints to warn the young and inexperienced. This, however, we do not get. The book begins with the confession that "antiquarian lore, even in the hands of experts, is inadequate to distinguish between true and false antiquities, and that relics of past civilisation have no evidential characteristics sufficiently marked to prevent them from being confounded with modern fabrications." We regret that we must differ entirely from Dr. Munro as to this. If for "expert" he will read "collector," we should be inclined to agree with him; but we do say that our experts are very rarely deceived. Mistakes may be made; no one is infallible; but in nine cases out of ten a real expert is able to say whether what purports to be a relic of past civilisation is or is not genuine. We agree that there are no obvious indisputable characteristics; and it is fortunate this is so, for, if there were, the forger would certainly copy them. The expert in the real sense of the word learns to distinguish the true from the false by general as opposed to special characteristics, and these general characteristics, although it might be impossible to clearly define them, are, in well-trained hands, an almost certain guide. If not, it may be asked, How was it that the British Museum experts came to the conclusion that the celebrated Tiara of Saitapharnes was a forgery? As Dr. Munro says, the doubts on the authenticity were confined to experts, and had no effect on the public. This is the point we desire to emphasise, that, when there are no indisputable marks that will point out an object to be a forgery, yet a well-trained expert will be able to say that such is the case from his general knowledge of the art and manufactures of the period of which the relic professes to be. A case of another kind illustrates this. The celebrated Codex Sinaiticus was alleged by a more than usually mendacious Greek to be a forgery, or rather that, in the Greek, a Dr. Simonides was the writer of it. Henry Bradshaw declared the Codex was genuine. Simonides asked him why. Bradshaw replied, "It was difficult to define, but it was more a kind of instinct than anything else, having lived for some years in the habit of examining MSS., not merely the text, but the volume, then all the writing, the paper, the parchment, the arrangement of the sheets, the distinction between the original volume and any additional matter, and with this experience, although it may be difficult to assign the special ground of confidence, he was hardly ever deceived, even by a very well-executed facsimile." It is because Dr. Munro appears to lack this instinct that he questions the existence of such a thing as scientific archæology, and the instance he gives of an Egyptian scarab, which he brought back from Egypt

to its native land, and a nodule of amber he acquired at Nügen, which was "made in Germany," confirm this view. One cannot help feeling that the old saying, "Once bit, twice shy," may have influenced Dr. Munro in his views on the Clyde oysters, those *bêtes noires* of Scotch archæologists. That the forgery of antiquities has become a regular business, both here and on the Continent, is true. Collectors with money who go to a place where antiquities have been found in hopes of getting some, do not now come away disappointed. We have not space to go into the question of the genuineness or otherwise of the American remains, nor to tell again the fascinating story of Flint Jack, or discuss the Irish antiquities so called, or the still more controverted question of the Clyde remains. We agree with Mr. C. H. Read that "to practical people antiquities are as readable as print and a good deal more accurate." The statement of Professor Boyd Dawkins that among the antiquities found in the Clyde are two fresh American blue-point oyster shells, is one which requires a good deal of faith to swallow. To Scotchmen the Clyde discoveries are, no doubt, of supreme importance; but to us "Southrons," who are also incredulous, it seems hardly worth while in a general treatise on archæological frauds to have devoted no less than about 120 pages out of 283 to one example of the art, and that by no means one of the first class.

Mr. J. A. MacCulloch, one gathers from his volume on *The Misty Isle of Skye: Its Scenery, Its People, Its Story* (Oliphant, Anderson, and Ferrier), is not himself a Skyeman, but during seven years' residence in it the island has become as dear to him as it can be to any native. His enthusiasm is untiring. The mountains, the moors, the folk-lore, "the pageant of the seasons," and even the geology of his subject, fill him with delight. Assuredly he has been a most assiduous student. We cannot imagine that there is any available information about Skye omitted in his 312 pages of close print. They are as statistical as a Blue Book. The histories of the MacLeods and the Macdonalds, two of the leading families in Skye, are traced for centuries; Dr. Johnson's tour is recapitulated; and, of course, we have, once again, a particularised account of Prince Charlie's wanderings. To Scotsmen acquainted with the history of their country, Mr. MacCulloch's book may possibly seem lacking in novelty; but it will be found useful, and even entertaining, by any Englishman who thinks of paying a visit to this island. The place is still without railways, and the roads are not very good; "but distance," says Mr. MacCulloch, "is nothing when you have to go ten miles to visit a neighbour. Everyone is known to you, east or west, north or south, and everything that goes on becomes almost a personal interest to you." Portree, however, which Mr. MacCulloch calls "the metropolis of Skye," has an increasing population, which now numbers 1,000. "The tourist traffic has caused several hotels to be built; the increase of business has erected banks and lawyers' offices; crime demands a court-house and an improved jail; and religious differences have filled the place with churches. . . . Culture is not forgotten: there is a literary society, a library, and a reading-room. The Muses haunt the place: report speaks of a dramatic society in the past, and in the present there is a flourishing choral union." In these respects Portree does not differ from any among hundreds of other little towns in Scotland, or in England, or in Wales. To say this seems to hint that Mr. MacCulloch is more matter-of-fact than imaginative. That is indeed the case. With especial eagerness, when we came to passages about fighting or the fairies, we searched for bright bits original enough in substance or in manner to be quoted or recited; but we are obliged to content ourselves with a tribute to Mr. MacCulloch's conscientiousness. He is an industrious historian, and his volume is generously illustrated from good photographs.

The tide of public opinion has of late been setting rather strongly against the presence of grayling in trout streams, and the argument generally put forward to the effect that the food supply is the governing factor, and that so many grayling mean simply so many less trout, is one we confess that seems very hard, if not impossible, to controvert. In Mr. H. A. Rolt, however, this species of salmonidæ have long found an ardent champion, and the new edition of his *Grayling Fishing in South Country Streams* (Sampson Low, Marston) certainly makes out a strong case for his favourite fish, though it is doubtful if anyone will go so far with him as to retain a stream for grayling only. His reasons for believing the grayling to be indigenous are ingenious; and all through the book he places the pros and cons very fairly before the reader, though leaving no doubt as to his own predilections. His wide and long experience of this fish must entitle his opinions and observations to the respect of all fishermen. The chief advantage of thymallus in a water really appeals more to the townsman than to the dweller in the country; the latter has his sport for every season of the year, and by the end of the summer puts his rod contentedly away. Not so the city man; he desires his occasional day in as many months as possible, and grayling which prolong his sport far into winter and yield him many an hour free from worry and foul air by the banks of his favourite stream will ever have his good word.

Messrs. E. L. Anderson and P. Collier are well qualified to deal with the subjects treated of in *Riding and Driving* (Macmillan). Many hints of value to the novice are to be found throughout the volume, which is sure to be of interest, even to those who have had long and practical experience in both riding and driving. Mr. Anderson, to whom that portion of the work which deals with riding and riding horses has been entrusted, appears to have a very poor opinion of English horsemanship, and speaks with something akin to contempt of equation as practised in the British cavalry, for which, by the way, considerable admiration has always been expressed by foreign military critics. But no doubt Mr. Anderson knows better. We may, perhaps, be permitted to suggest that the illustration of how to mount a horse, as given in Fig. 30, page 58, is entirely wrong both in principle and in act. Mr. Price Collier is to be congratulated upon the able and exhaustive treatise on "The Harness Horse and Driving" to which his signature is appended. The work under notice is profusely illustrated, but in the majority of cases the pictures are too small to be of practical value from an educational point of view, and their reproduction leaves much to be desired. Some of the American ideas on both riding and driving are sure to be perused with interest and advantage by English sportsmen, and the book itself should find a place in the libraries of those interested in the matters contained within its pages.

ON THE GREEN.

LAST week so much space was devoted to the play of the amateurs at Prestwick that no room was left to discuss the work of the professionals; but with the open championship hard upon one, it is of interest to see what the professional class has been doing. Of course, it is always within the scope of the possible that one of those who played in the amateur championship may win the open event, but the odds on a professional winning are something like ten to one, if not more. Of the professionals Taylor and Braid have been doing the best work during the early part of the year. Taylor at first had the advantage,

although a big field of famous players had a set back at the hands of Toogood. He, however, has not shown quite the same sustained excellence of play as some others. Harry Vardon appears to be not quite so wonderful as he was. Herd is a little behind Taylor and Braid, and White has never, it would seem, quite recovered from the great strain of the championship that he won so finely. My own choice from all the field—and it is a brave thing to make a selection when it will be verified or disproved before it appears in print—is Taylor. The accuracy of his second shots and his control of the approach stroke should make him very formidable at St. Andrews, where the second stroke counts for so much, and the greens are so closely guarded by dangerous bunkers. If an amateur should win, I am inclined to think Mr. Maxwell would be the victor. Although the amateur champion is at home at St. Andrews, it is hardly to be thought that he will not have a bad hole or two in the long course of seventy-two holes, and in such a field as that no man can afford a bad hole or two. For thirty-six holes Mr. Graham might be dangerous, but he does not seem able to keep his best game going day after day. I do not see that there are any others very likely to win, and after making a statement as rash as that, it is almost certain that by the time this is read someone not named in these speculations will have turned up as winner. Herd, of course, is very much at home at St. Andrews, and he played very well at Ranfurley, near Bridge of Weir. Harry Vardon was second to him there in the scoring, qualifying, round, and Vardon also played a wonderfully good game lately against Willy Fernie at Troon, defeating him badly. So it does not do to overlook his chances. Whether the entry is a record one I do not know; but this year it would almost create a record if it were not a record—so many record entries are there. There was a record entry for the amateur championship, a record entry for the ladies' championship—in which, by the way, Miss Dorothy Campbell played a very fine first scoring round indeed—and a record entry for the Bar tournament. I rather think the entry was a record one for the Parliamentary tournament, too, but am not certain. With regard to the Ranfurley tournament, where Herd had the best of them all in the scoring, it has to be said that Taylor was not in the field, neither was Braid nor White. All these had gone on to St. Andrews, in preparation for the bigger business there.

HORACE HUTCHINSON.

THE AGRICULTURAL SHOW AT WOLLATON.

THE migration of the Bath and West of England Show to Nottingham has turned out a most pronounced success; indeed, the occasion seems to have been a record one, both for the town and for the show. The number of entries exceeded that of any previous year, and luckily the weather was beautiful, and the number of visitors in excess even of that which attended the last show of the Royal Agricultural there. Everything went on so well that there can be very little hesitation in anticipating that the results will show a handsome surplus, and thereby encourage the Bath and West to still further extend its circuit, so as eventually to bring the whole of England under its influence.

The show was opened with great pomp and ceremony, and several excellent speeches were made by the Mayor of Nottingham, the Duke of Portland, and others. It is worth noting that in almost every particular Nottingham beat Swansea in regard to the number of entries. There were, for instance, in the former place 592 cattle, as against 475; 362 horses, as against 283; 187 sheep, as against 131; 221 pigs, as against 158; 225 specimens of farm produce, against 207. The only falling off was in poultry, the figures being 282, against 335. The quality, too, was as good as the quantity. Particularly in horses was this true of the Shires, though there was a slight falling off in the show of hunters and other light horses. The fourteen different sections of cattle threw a weight of responsibility on the judges: many of them were not only first-rate, but very level.

Among those who were fortunate enough to carry off prizes were His Majesty King Edward VII., whose well-known Hereford bull Fire King beat Mr. Faber's Prime Minister, the only opponent in the class, though the King was beaten in his turn in the younger class by Mr. A. P. Turner's Marquis and Mr. A. E. Hughes's Premier. Among the other winners in the cattle section may be mentioned the Right Hon. A. E. Fellowes, M.P., with his beautiful red-polled cow Alba. The third place in the class was awarded to Lord Amherst of Hackney. In Aberdeen-Angus Mr. Cridlan and Mr. R. W. Hudson had their usual duel, the victory going to Mr. Cridlan on this occasion. In Jerseys Lord Rothschild scored very well, and so did Lady de Rothschild, of whose herd we show photographs in another part of the paper, Coral winning first prize in her class, Lady Dora being awarded first in the milking trials, and first and gold medal in the butter test, and Freak being placed third, and winning special butter prize in the butter test. In Shires Lord Egerton of Tatton, Sir P. A. Muntz, the Duchess of Newcastle, Mr. S. Atkinson-Jowett, Mr. Bradley, Lord Middleton, and Mr. P. L. Mills all carried off premier places. Much satisfaction will be felt in the increase of the number of sheep exhibited. The Leicesters were particularly good, and a fine specimen belonging to Mr. Jordan of Driffield was a shearling ram that ought to be heard of again.

The butter and cream exhibits were of a very high quality, and those competing were mostly people in the neighbourhood. The Bath and West has always been noted for its implements and machinery, and these were above the usual high standard. There were no fewer than 104 sheds in the showyard, and many interesting novelties were shown which are worthy of more special note than there is room here to give.

"A high-class Cigar in perfect condition"

describes "LA FLÈCHE."

Perhaps you consider that you cannot afford to smoke cigars because cigars that are worth smoking are expensive. It is unfortunate that it should be so, for a good cigar is a far more healthful and satisfactory smoke than a cigarette. It is owing to the conviction that there is a great need in England for a

High = class Cigar at a Moderate Price

that we have introduced **"LA FLÈCHE"** to the British market, and have already met with a gratifying measure of success. **"LA FLÈCHE"** is a blend of the purest Havana and St. Felix Brazil tobaccos, choice and aromatic, all fine, whole leaves, selected and rolled with the greatest care. It is in no sense a cheap quality cigar, but is equal to the best reputed Havana brands, and as acceptable to the connoisseur as to the humblest devotee of the weed.

BOX OF 100 CIGARS 22/6

THE AUTOMOBILE WORLD.

A SHORT TOUR FOR WHITSUNTIDE.

[By a Correspondent.]

As many of your London readers may be unable to get away at Whitsuntide for more than two or three days, I should like to recommend a short tour, which, while including some of the most delightful scenery of the home counties, will yet be found quite easy of accomplishment by the smallest-powered car. As the whole distance covered is only some 230 miles, it will not entail any of that continual pressing on which always mars the real enjoyment of touring. The car should leave London by the Hammersmith Road, and, traversing Richmond Park, strike the Portsmouth Road at Kingston. As this great highway is probably very familiar, at least as far as Guildford, a pleasant little detour can be made by turning sharp to the left in Esher at the Bear Hotel, over Oxshott Common, bearing to the right after crossing the railway, till by a winding country road Cobham Station is brought into view, when another turn to the right takes one through Cobham Village past the old mill. The first sharp turn to the left after this leads round by the church, and over the Mole bridge—giving picturesque views of the river—when the right-hand road should be taken through Hatchford and out into the Portsmouth Road again just above the Hut Hotel. The last part of this winding side-road is particularly attractive at the present time, as masses of rhododendrons clothe the slopes on either side; indeed, the whole of this unfrequented detour is quite worth the slight trouble and the extra few miles which it may entail, apart from the comfort it gives of escaping, for a short time at least, from the dust of the main road. From the Hut, on through Ripley, Guildford, and Milford to Hindhead the road is full of interest, while in the fine air of the latter spot the passengers may enjoy lunch, and the engine a "cool-down" after its long climb and the forty odd miles of its journey. By far the most pleasant way of "refreshing the inner man" while touring, however, is to carry a luncheon-basket (which can be refilled wherever one stops the night) and picnic in some quiet spot off the main road. The wayside hotels seem always unprepared for guests, and after a long wait in a stuffy room, the food which arrives is usually unpalatable, while the final straw which breaks the motorist's temper is the charge of 1s. frequently levied for the standing-room of his car during lunch!

THE WINNER OF THE SCOTTISH TRIALS.

The 20 h.p. Ariel which made highest marks out of forty-three cars, and was awarded the gold medal in its class.

Continuing the run from Hindhead down the long incline and through the lovely scenery of Liphook to Petersfield, the main road is there left, and a good cross-country road taken to Winchester, up Bordean Hill and through Bramdean. At Winchester—after a break for tea, and possibly a view of the cathedral—a lovely drive can be taken in the cool of the evening *viâ* Romsey and Cadnam—where the pretty twisted chimneys of the cottages along the road are worth notice—to Lyndhurst, and here a halt is suggested for the night, the day's run having reached about 100 miles. The New Forest, always an ideal spot for motoring, is in the zenith of its beauty now, with its varied greens still in their fresh brilliance, the young bracken springing underfoot, and the birds, with which the forest abounds, in full song. On Whit-Sunday short drives might be taken through the wood and moorland, whose peaceful solitudes cannot fail to charm the tired Londoner, and where fresh beauties are unfolded at every turn of the road. One of the most varied of the short circular drives is through Cadnam, past Castle Malwood and the Rufus Stone (near which is the curious natural freak of an oak and beech tree growing from one stem), through Stony Cross to Mogslade Hill, and so, by a sharp turn to the left, back to Lyndhurst. The suggested run for Monday being about 120 miles in length, the first thirty miles might be accomplished on Sunday evening to Ringwood, and thence directly north to Salisbury, where the second night could be spent. Leaving the Cathedral City not *viâ* Old Sarum, but through Woodford and along the right bank of the river Avon, the Exeter Road is struck beyond Little Amesbury, and here, a few miles to the left, is Stonehenge. Turning on the homeward route, presumably after a visit to the famous monoliths, all is "plain sailing" through Amesbury, Andover, and Basingstoke, till Hook Common is reached. Here, however, it is worth while to leave the main road by a turn to the right at the Dorchester Arms for Odiham, and have refreshments at the quaint old coaching inn, with its dark oak panelling and its glass and china of a bygone age carefully arranged in antique cabinets. A four-mile run back into the main road at Hartley Row, a whizz over the three miles of dead level at Hartford Bridge Flats, and one is soon nearing Bagshot. A halt should be made here to visit Messrs. Waterer's well-known nurseries, where the rhododendrons are now in full beauty, a special show of them being held from June 8th onwards. From thence to London is only a matter of twenty-six miles, through Egham and Hounslow; but if this narrow tram-infested entrance to the metropolis seems a poor ending to a pleasant trip, there are several pretty cross-country routes from Staines into the Portsmouth Road, which, though longer, keep one in sight of green hedges till Putney itself is reached.

MOTORISTS AND PARLIAMENT.

Automobilists may view with mingled feelings the debate in the House of Commons last week on the administration of the Motor-car Act. On the one hand they may console themselves with the fact that there was less absolute ignorance of the true inwardness of the automobile movement than was displayed when the Act was first discussed and passed; while, on the other, they have reason to deplore the inacquaintance with the practical side of motor-car management which still prevails among many members of the House. So far as attempts to make party capital out of the situation are concerned, it would be out of place to discuss them here; let it be charitably assumed that the debate was conducted on strictly academic lines, with the sole object of discovering a solution of the

problem. In the matter of the Local Government Board's recommendation to local authorities not to press for special limits of speed until the stringent powers of the police under Section I. of the Act had proved inadequate—which recommendation was the *fons et origo* of the debate—it is impossible for anyone who has genuinely examined all the facts to say that the Board has not acted constitutionally and wisely throughout. In the few cases where speed-limit enquiries have been pressed for, there has not been the slightest evidence put forward on which the Board could legitimately grant the application. In nearly every instance the police have admitted outright that they have had no difficulty whatsoever in dealing with whatever cases of furious driving have occurred. Moreover, the applicants have invariably been posed by the following questions: "You must admit that even if a ten-mile limit were imposed there might be cases in which drivers proceeding at eight miles an hour might be driving to the danger of the public. In that case the regulation as to the ten-mile limit would be of no use to you, and you would have to proceed under Section I." To this the answer has necessarily been in the affirmative. Then comes the obvious corollary: "Then why cannot you equally proceed under Section I. in cases where ten miles an hour is exceeded?" In not a single instance has a satisfactory answer been returned, and having attended several of the enquiries myself, I have been an eye-witness to the complete discomfiture of the applicants in the face of these propositions. Another thing which has made it impossible, moreover, for the Board to grant the various applications is that they have been too sweeping. Instead of defining certain congested areas they have embraced in most cases the entire borough; and where is the town which, however congested in the centre, does not extend its boundaries into an uncongested area? At Beverley, on the other hand, a small area was defined as exceptionally unsuitable to free locomotion, and a limit was obtained even so low as five miles an hour!

As for the references in the debate to the broad question of furious driving, they were chiefly conspicuous for the moderation of the automobilists and the excess of punitive zeal on the part of their antagonists. Mr. Arthur Stanley and Mr. Scott Montagu admitted that a percentage of hooligan drivers did exist, but denied that they were more than a small minority, and expressed a keen desire to secure their suppression. Nothing that was said by the other side, however, could carry conviction for a moment to anyone who really understood automobiles and their handling. It was regrettable in the extreme to see a sober politician like Sir Henry Fowler, himself a former President of the Local Government Board, arguing that a reduced speed limit was the panacea for motoring ills. He was corrected, too, on a point of law with which every layman, much less a lawyer or a politician, who had read the Motor-car Act would be perfectly familiar; indeed, the frequently-expressed inacquaintance with the legal aspects of the problem which anti-automobilists display is ever more distressing than their want of practical knowledge. To one contention of Sir Henry Fowler's I would proffer a particularly strong denial. He averred that cars were driven every day in London at speeds which were dangerous to the public. Personally, I see hundreds of cars a day circulating in the West End, and, whatever occurs elsewhere, I can testify to the high average of skilfulness and consideration which is displayed by metropolitan drivers. What is wanted is some method of inducing drivers who lack manners to slow down more systematically in villages which adjoin a straight high road, instead of merely in winding streets, where speed reduction is automatic, and to display more consideration in passing other vehicles; and, above all, that the dust nuisance should be abolished. None of these things, however, can in any sense be attained by any arbitrary speed limit, to which the hooligan type of driver would pay no heed. COMMUTATOR.

Some contrasts in locomotion.

MOTOR-CYCLE ELIMINATING TRIAL.

IMMEDIATELY following the Eliminating Trial for the Gordon Bennett Cup cars in the Isle of Man came a trial for motor-cycles, with a view to determining the selection of the British team in the International Motor-cycle Cup Race, which takes place a few days hence in France. Originally the trial course was the same as that for the cars, but owing to the difficulty of the corners on Snaefell, the route was materially altered. Instead of going all round the island, it formed a triangle of twenty-four miles in extent, the angles being at Douglas, Castletown, and Ballacraine respectively. The entries were numerous, but from one cause or another, only seven put in an appearance, among the absentees being Sir A. Conan Doyle's machine. Starting at 3.30 a.m., the competitors had to cover the course seven times, making a total distance of 168 miles in all. Accumulator and other troubles prevented more than two men finishing, in the persons of Campbell on a 6 h.p. Ariel, and Collier on a 6 h.p. Matchless, though for the first four rounds Franklin on a 6 h.p. J.A.P. was easily first. Campbell's time was 4hr. 9min. 36sec., and Collier's 4hr. 9min. 52sec. The first named also secured

the *Motor* Cup for the first man to finish. Campbell, Collier, and Franklin have been selected to represent this country in the International race.

THE AUVERGNE CIRCUIT.

No hope is held out by the president of the French Automobile Club of any withdrawal of the recent regulation of the Minister of the Interior prohibiting all practice by racing cars on the Auvergne Circuit. Needless to say, this ukase, however necessary in the circumstances, as the peasantry have become alarmed at the continued presence of so many fast cars, presses very hardly on the British representatives. The French cars have been on the course for weeks, as also have the Germans and Italians, and the interdict has done them little harm. It was obviously impossible, however, for the English cars to be in Auvergne when they were obliged to be practising in the Isle of Man; besides which, no one would care to go to the expense of practising over the Cup course until certain of a place in the British team, whereas the German and Italian teams were long since chosen without an eliminating trial. On such a route it is absolutely imperative that every driver should know the course by heart; a tour of the Isle of Man route was of itself quite sufficient to show anyone that without familiarity with the gradients and corners success was out of the question. As matters have turned out, it may even happen that the British team may be withdrawn, and that this would rob the race of much interest is obvious.

LIGHT DELIVERY VAN TRIALS.

Regulations have now been issued by the Automobile Club for the Light Delivery Van Trials, which will be begun on September 19th. They will comprise thirty days' service of each vehicle, and subsequent examination by the judges. The vans will be divided into four classes according to size. In Class A the load will be limited to 5cwt and in Class B to 10cwt., and in each of these categories the vans will be expected to average a distance of eighty miles a day. The load for Class C will be up to 1 ton, while in Class D the maximum limit will be 1½ tons, and sixty miles is defined as the daily distance in each case. During part of the trials the vans will be run without a load. Every vehicle will stop as great a number of times as may be directed for the purpose of testing their starting and stopping powers, and in order that the conditions may approximate to those of actual practice. Not more than two vehicles of the same type by the same maker shall compete in any one class. The club reserves the right to abandon the trials if the number of entries received by noon on August 23rd is inadequate. The first award in each class will be the gold medal of the club, and the second award a silver one. There will also be many awards from the prize fund to which the club, the Society of Motor Manufacturers and Traders, and Messrs. W. H. Smith and Son have contributed. A diploma is also offered by the Army Council for the vehicle which is considered by the War Office Committee on Mechanical Transport to be, either as a whole or in some detail of its engine, etc., most meritorious from a military point of view, and therefore likely to be of service to the Army. As regards the actual running, the main condition is that a maximum period of 30min. will be allowed both before and after each day's run for replenishing, lubricating, adjusting, repairing, and getting up steam; any time in excess of 1hr. will be added to the running-time of the following day's run. The regulations as a whole seem to be comprehensive and satisfactory, and it is only to be regretted that the club has not seen its way to take into consideration the kind of body fitted to the light delivery van, instead of considering the mechanical aspects of this type of vehicle alone. The hooded van is the most dangerous vehicle on the London streets, and, if motor-vans are to increase largely in number, it is desirable that they should adopt a better kind of body than that to which so many accidents may be ascribed.

CAPTAIN BANBURY'S 24 H.P. MORS.
Driven by its owner in the Scottish Trials, this car has been awarded a silver medal in its class.

THE ALIEN DRIVER.

A reckless motor-car driver in this country, after a second conviction, may have his licence suspended by a bench of magistrates for any period they may think fit. It is unfortunately open, however, for any alien driver who has found his occupation gone in his own country, owing to his proved negligence, to come to Great Britain and start with an apparently clean sheet for lack of evidence to the contrary; in other words, he may take out a driver's licence, free of endorsement, although in his own territory he has

Any Car can win a Cup like this.

It takes an ARROL-JOHNSTON to win the GLASGOW CUP.

WHY are the ARROL-JOHNSTON Cars, Vans, and Lorries the most economical?

Because
Of their efficient motors.
Of their efficient transmission.
Of their efficient form of governing.
Of their Solid Tyres.
They do not use an Automatic Carburetter.

How was this proved?

25 British and 19 Foreign Cars were entered for the Scottish Reliability Trials. The ARROL-JOHNSTON Car ran 43·8 ton miles per gallon of Petrol and won the Glasgow Cup. The next best car ran only 35·37 ton miles per gallon.

We will be delighted to send Catalogues and full particulars on receipt of a post-card.

BROTHERHOOD-CROCKER MOTORS, Ltd., 19, Hanover Sq., London, W.

become a marked man. To remedy this state of things Mr. Scott Montagu has brought in the Motor-car (Alien Drivers) Licences Bill, which has just been printed. It proposes to make it compulsory for every person taking out a driving licence to state whether he is or is not a non-resident alien, and, in the latter event, to state particulars as to his nationality, place of birth, and residence. He must further produce evidence in writing from the police authority of his district that his character and conduct as a driver of motor-cars have been satisfactory, and, if drivers in his locality are required to be licensed or certificated, must produce the actual licence which he held before leaving his own country. The

BRITISH MOTORS AT THE BUDA PESTH EXHIBITION.

furnishing of false particulars, or forging a certificate or licence, is to be accounted an offence under the Motor-car Act. The term "non-resident" is to refer to an alien who has not been living in the United Kingdom for at least six months. There is a considerable number of foreign drivers in this country, and no power exists at present to compel any such to furnish evidence as to his previous career. Some of them have doubtless "left their country for their country's good," and it is just as well that further incursions of the kind should be frustrated as far as possible. Hence, one may hope that Mr. Montagu's proposals may receive Parliamentary sanction in due course.

Wolseley Motors at Buda Pesth.

We illustrate herewith the Wolseley exhibit at the recent exhibition held at Buda Pesth. The cars in the picture are 6 h.p. and 12 h.p. standard Wolseleys. The boat in the foreground is a 40ft. cabin cutter fitted with a 60 h.p. four-cylinder motor. In the background is a racing hull fitted with a 100 h.p. engine. Farther back are to be seen the balloons exhibited by the Hungarian War Department, so that all three modern methods of locomotion—motor-car, motor-boat, and balloon—are represented. Special interest attaches to the Wolseley motor-boats, a branch of the industry to which the great Birmingham firm are at present paying much attention.

Inaccurate Police Timing.

The inaccuracy of the timing methods employed by the police was never better exemplified than in a recent case heard before the Bishop's Stortford Bench, when a motorist was charged on the evidence of four constables with covering four miles between Thorley and Sawbridgeworth in five and a-half minutes, or at an average speed of 43½ miles an hour. The defendant stated that on the day in question he was driving a 7 h.p. Panhard with four people in it, and that there was a strong head wind and the roads were wet. He estimated his speed, when he was being timed, at fifteen or sixteen miles an hour. Since the date of the charge he had taken the car to the same four-mile stretch, and with a dry road and the wind behind him and only two passengers on board, had been unable to cover the distance in less than twelve and a-half minutes, or seventeen miles an hour. Messrs. Panhard's manager said the maximum pace the car could do under the most favourable conditions was twenty-four miles an hour, and the speed alleged by the police was utterly impossible. If any 7 h.p. car could run at 43½ miles an hour his firm would purchase it at once. At this point the magistrates stopped the case and dismissed the charge, the chairman remarking that they were not satisfied with the evidence of the police watchers. At the end of the sitting, during which a number of motorists were heavily fined on similar evidence to that which had been proved so utterly unreliable in the case quoted, the chairman said that the Bench wished to state that they thought much greater care should be taken by the police in checking the times occupied by motorists in covering certain distances, and the police should also be provided with more reliable watches, and should be carefully drilled in the proper method of timing.

The Truth about some Recent "Motor Accidents."

Much of the recent public agitation against the automobile has been engendered by the unscrupulous tactics of a few of the halfpenny daily papers, which delight in sensationalism, and pay little heed to the injury and injustice that their lying headlines often cause. Any accident on the road, the cause of which is not immediately apparent, is unhesitatingly ascribed to the motor-car, in order that the "Motor Peril" column may be kept well filled. The true facts, when they become known, are entirely ignored; and it is little to the credit of a certain class of journalism that temperately-worded letters of

BY APPOINTMENT TO HIS MAJESTY THE KING

BY APPOINTMENT TO H.R.H. THE PRINCE OF WALES

THE BEST HILL-CLIMBER.

At the HUDDERSFIELD AUTOMOBILE CLUB Hill Climb on May 27, the 28-h.p. DAIMLER made fastest time.

On the same day, at Kettleby Hill, the 30-h.p. DAIMLER made fastest time, and the 28-h.p. DAIMLER came in second.

On Saturday, June 3, the 30-h.p. DAIMLER made the fastest time in the MIDLAND AUTOMOBILE CLUB Hill-Climbing Contest at Broadway.

The DAIMLER continues to prove itself the best hill-climber of the year.

DAIMLER MOTOR CO. (1904), LTD.,

HERON MOTOR CO., 87, John Bright Street, BIRMINGHAM

correction are frequently refused publication. We quote two typical cases: In the Press of May 22nd there appeared an account of a labourer being left in a senseless condition on the road by motorists. The facts were investigated by the local correspondent of the Motor Union, and the police informed him that they were satisfied that no motor passed through the place at the time, and that they were also satisfied that the accident was not the result of motoring. The local papers acknowledged that there was no truth in the original report; but most of the London papers neglected to correct the falsehood to which they had given wide currency. Another case was that of a boy at Hendon, who was reported to have been killed by a motor-car. Independent witnesses at the inquest proved that the boy was riding his bicycle down a hill at a furious speed, with his feet up, without a brake, that the tyre burst, and that he suddenly rushed from behind a van which he was overtaking and fell from his bicycle upon his head, some feet in front of a car which was travelling slowly uphill. The car never came in contact with the boy at all, who died from the effects of his fall—a fact duly recorded in the verdict of the jury, who acquitted the motorist from all blame.

MOTOR-OMNIBUSES *v.* TRAMCARS.

As a result, no doubt, of the difficulty in obtaining capital for tramcar developments, because of the growing faith of the public in the superiority of the motor-bus, every attempt is being made by those who are directly interested in the electric tram to prove that it is the most economical and beneficial vehicle ever built, and that the motor-omnibus has not even the ghost of a chance against it. The mere fact, however, that so vigorous a campaign has been organised by Mr. Clifton Robinson, and the electrical journals, of itself betokens a considerable amount of apprehension on the subject. This apprehension is based not only on the fact that several boroughs, which were about to inaugurate a tramway system, have decided to abandon their projects and resort to motor-buses instead, but also on the many and palpable advantages which the new type of vehicle confers. Looking at the subject broadly, it must be admitted that the motor-bus is free from most of the disadvantages of the tram, and that there is little to be said *per contra*. That a tram system will carry a large number of people cheaply is incontestable; that is the sole justification, in fact, for the establishment of the monopoly. This monopoly, however, brings with it numerous permanent disabilities for other road-users, and as these disabilities can all be abolished by means of the motor-bus, it is obvious that the latter should be welcomed accordingly. Tramlines, owing to their slippery nature and frequently unskilful laying, are a source of danger to all other forms of traffic. The system, moreover, of sending vehicles along a rigid line in the middle of the highway has many drawbacks.

The breakdown of a single car will "hold up" a whole system, a thing which occurs on lengthy tram routes like that to Uxbridge with great frequency. It often happens, moreover, that a whole line of tramcars is held up by the breakdown of a waggon or other heavy vehicle across the rails. In all such cases, motor-buses would cause infinitely less inconvenience to the public. If one bus failed, the others would still continue running, while, if a cart broke down in the middle of the road, the motor-bus could go round it, or even be diverted into a side street. In another way, too, tramcars offer considerable obstruction to free locomotion, for every time a car is stopped the traffic has to be held up while passengers alight and walk to the pavement, or walk from the pavement in order to board the car. Accidents, too, it may be added, occur from this same cause. Motor-buses, on the other hand, could draw up to the pavement either to set down or take up passengers. The tramcar partisans have vigorously proclaimed that tramcars are cheaper than motor-buses; but inasmuch as motor-buses are quite new, and no authorised figures have yet been forthcoming, it is to the last degree absurd to speak of cost in the absence of all evidence. One thing is quite certain, however, that wherever motor-bus services have been established on business-like lines they have proved a success, and have been, and are being, extended.

DRAWINGS FOR AN 18ft. MOTOR-LAUNCH.

This useful little vessel has recently been built by the Immisch Company from designs by Mr. Linton Hope.

A KINDLY WARNING.

It is to be hoped that motorists of all classes will pay careful heed to the requests of the Chief Constables of Lincolnshire and Dorset, who are evidently anxious to avoid the necessity of employing the harsh measures which the authorities of so many other counties have recently adopted, with the usual result that careful drivers have often suffered equally with the reckless and inconsiderate. These two officials have written to the Automobile Club, the first asking that members should observe special care on the Great North Road, and more particularly in the neighbourhood of Grantham, where complaints have been numerous of late; the latter making the same request in the case of the town of Sherborne and its neighbouring villages, in view of the coming "Sherborne Pageant" on June 12th to 15th. The letter of Captain C. Mitchell-Innes, the Chief Constable of Lincolnshire, contains the following sentence, which we gladly quote, as indicating the reluctance of the police of that county to make use of the detested and unfair system of "traps": "Relying upon the sincerity of the desire of the committee and members of the Automobile Club, so often and so strongly expressed, for the suppression of

AN ECONOMICAL CAR.

The 12 h.p. Arrol-Johnston, which won the Glasgow Cup for economy in petrol consumption in the Scottish Trials.

inconsiderated riving upon public roads, and appealing to the perfectly fair and considerate treatment extended towards all motorists by the police of this county, I would ask the Automobile Club to use their best endeavours towards securing a more satisfactory state of affairs as regards the use of the road in question, and so enable the police to avoid employing harshly repressive and vexatious measures, which are so much to be deprecated in principle, and are repugnant to all concerned." During the Whitsuntide holidays the many hundreds of motorists who will be travelling upon the Great North Road will have an opportunity of showing their appreciation of the good sense and the kind feeling of the Chief Constable of Lincolnshire, of which we hope they will be careful to avail themselves.

THE CONTROL OF COMPETITIONS.

Last week we pointed out that the stringency of the very excellent competition rules recently formulated by the Automobile Club might with advantage be relaxed in the case of "closed" events organised by provincial clubs in which sport and amusement are the objects that the participants have in view rather than mere trade advertisement. It is clear that the parent body already recognises that regulations which are absolutely necessary to secure the satisfactory management of a big public meeting might, if strictly enforced, seriously discourage the holding of friendly competitions between the members of provincial clubs, and the Races Committee has immediately taken in hand the task of amending the competition rules with a view of rendering them more elastic than was at first intended.

AUTOMOBILES AND AGRICULTURE.

If slow, the progress of the agricultural motor is none the less sure. So successful has the motor-waggon service been in Yorkshire between Tollerton Station and Brandsby that it has quite revolutionised the produce trade of the district, and the Agricultural Organisation Society has in consequence been able to start the erection of a set of buildings at Brandsby which are to serve as agricultural stores. Another sign of the times appears in the shape of an interesting statement by a Staines farmer, who has used an agricultural motor for a period of twelve months. During that time it has ploughed on an average $2\frac{1}{4}$ acres per day, using a double-furrow plough, and making each furrow 6in. deep by 9in. wide. The land on which the motor-plough has been used is of a heavy character, and requires three horses, with a man and a boy, to plough three-quarters of an acre per day. To do the work accomplished by the motor-plough, nine horses, three men, and three boys would be required. As regards the relative expense, the farmer states that the work cost £1 14s. 6d. with horses, men, and boys for ploughing $2\frac{1}{4}$ acres, as against 18s. 6d. with the agricultural motor. The latter machine, moreover, in addition to ploughing, can be used to drive a five-knived chaff-cutter at half the cost of steam, thus saving 7s. 6d. per day. It is also used on occasion for threshing and for hauling.

It may be added that two new agricultural motors have just been introduced. One is an Ivel, intended for use in hop-gardens and vineyards, for which purpose it has been made specially narrow, so that it can go through the alleys without damaging the fruit; the total width, in fact, is only 4ft. $3\frac{3}{4}$in., the wheels being placed inside the frame instead of outside. The horizontal motor which is used has twin cylinders of $5\frac{1}{2}$in. bore by 5in. stroke and develops 14 h.p. at 900 revolutions per minute. No pump is fitted, the thermo-syphon system of water cooling being employed. The machine can be driven on petrol alone, or, if desired, can be used with a new carburettor which will serve for petrol or paraffin alike. As a result of some recent contests it is stated that with this carburettor, while using paraffin, only $8\frac{3}{4}$gal. of fuel were consumed during a working period of 4hr. 13min.,

during which time the machine ploughed 3 acres 1 rood 30 poles, at an average depth of 7½in.

Another new petrol-driven plough has also been introduced in France. It is fitted with a four-cylinder Vautour motor of 24 h.p., and is mounted on a steel chassis. The engine is water-cooled and works a dynamo charging the ignition batteries. The machine is fitted with a carburettor, which will use petrol, paraffin, or alcohol at option. When used as a plough the machine can be driven at an average speed of 2½ miles an hour, but it can also be employed at a faster pace for tractive purposes on the road.

THE MOTOR-BOATS OF 1905.

Continuing our practice of describing from time to time representative types of motor-boats of recent design, we reproduce on another page drawings of an 18ft. launch which has been completed within the last few days by the

THE LANCASTER ADAPTER
For altering a commutator from roller to wipe contact.

Immisch Company of Hampton-on-Thames, from designs by Mr. Linton Hope. This is a useful and attractive-looking little craft, which is suitable for general use on rivers or inland waters. The seating room is sufficient for six to eight persons, and the arrangement of the propelling mechanism renders the boat particularly convenient for the owner who is his own steersman and mechanic combined. The hull is carvel-built with 3-8in. cedar planking, finished in narrow widths, and the timbers are of elm, ½in. sided, and 7-16in. moulded, and spaced 3½in. centre to centre. The keel is of Oregon pine, and stem, sternpiece, deadwood, breasthook, floors, beams, and knees are all of English oak, natural crooks being employed wherever possible. It will thus be seen that the hull is a substantial piece of work, well fitted to bear the weight and strain of the propelling mechanism. The latter consists of a 3 h.p. four-cycle "Scout" motor, fitted with a 3 to 1 reducing gear. The reverse is obtained by a Gaines reversible propeller in bronze and fitted with a Hoffman ball thrust-block. The control is simplicity itself, as the engine is fitted with a special throttle connected with the reversing lever, so that the engine is automatically slowed down when the lever is in the neutral position. This is a point of some importance when the boat has to be taken in and out of locks by one man, as he has only the tiller and the reverse lever to attend to. The speed is about seven to eight miles an hour, which is ample for a river-boat, and the small draught—only slightly over 1ft.—would enable many out-of-the-way spots to be visited which would be inaccessible to the ordinary steam-launch. In a sense this motor-boat may be described as a "popular" type, as the cost, complete with cushions and fittings, is only £100.

A NEW SYSTEM OF CHARGING ELECTRIC CARRIAGES.

The cost of keeping an electric carriage will be very materially reduced by the system which the Electromobile Company has introduced, in conjunction with the principal electric-supply companies of London. There is no doubt that the garage system has proved a success in conducing to reliability and freedom from breakdown, owing to skilled periodical examination, and the replacement of worn parts immediately it becomes necessary. Up to the present, owing to difficulties in connection with the private charging of the batteries, carriages have been obliged to come daily to the depôts to charge or change their batteries; and this, in the case of owners living at some distance from the garage, has led to a waste of battery power and of tyres which has unnecessarily increased the cost of keeping an electric carriage.

It is now proposed to continue the garage system so far as it concerns the mechanical upkeep of the carriage, but the charging of batteries can henceforward be carried out in private stables at an extremely low cost. The plant will be put into the owners' stables by the companies at a small rental, and the necessary power for charging will be supplied at rates varying from 1d. to 2d. per unit. Of course this arrangement cannot be made in every part of London, but several of the electrical supply companies have come into line on the matter, and the chief residential districts are already covered.

Under the new scheme the cost of electricity should not exceed £20 per annum, and in many cases it will be less. The battery has now reached such a degree of excellence that replating should not be necessary under eighteen months, which would make the cost of replating about £50 per annum. An ordinary coachman can be taught all that is necessary to keep the battery in good condition. Tyres will cost about £35 a year, and mechanical replacements should not exceed £50 a year, thus bringing the annual cost, exclusive of wages, to £155 a year. If owners prefer, they can have their carriages systematically inspected and maintained in running condition by contract, and all parts renewed when worn out for an inclusive sum of £75 a year. In such cases they are lent a carriage while their own is being repaired.

HILL-CLIMBING AND PETROL CONSUMPTION IN THE SCOTTISH TRIALS.

Last week we gave the full list of awards in this competition, but, owing to pressure on our space, were prevented from dealing at greater length with

THE ELECTROMOBILE COMPANY, LIMITED,

the judges' report. We now give a list of the cars which completed the trials arranged in order of merit according to the marks awarded for hill-climbing. In the second and third columns respectively will be found the figures relating to the average petrol consumption per ton mile, and the miles run per gallon by each car throughout the trials. The former alone shows the real fuel efficiency of the competing vehicles, and the latter is merely of interest as indicating the quantity of petrol required to run each car with a full load over roads of a peculiarly trying character. It need hardly be pointed out that the low marks obtained by the Daimler in no way reflect on the undoubted hill-climbing powers of that very excellent car, and were entirely due to the unfortunate silencer trouble which it experienced during the ascent of Aberfeldy hill.

Name of car.	*Hill-climbing marks.*	*Consumption per ton mile in gal.*	*Miles per gal.*	*Order of merit for fuel consumption.*

ITEMS.

At the time when there seemed a probability that the match between M. Paul Meyan and Mr. Siddeley would fall through, owing to a hitch in the preliminary negotiations, Mr. Edge wrote to the former, saying that he would be very pleased to drive his Napier against M. Meyan's De Dietrich. Messrs. Jarrott and Letts have now offered, in order that Mr. Edge should not be disappointed in his desire to test his car, to run another De Dietrich against his Napier over the same route and under the same conditions as the Siddeley-Meyan trial, or any reasonable modification of the same.

Messrs. Rolls inform us that the brake tests of their six-cylinder engine, which proved quite satisfactory, have been confirmed by the road tests of the complete chassis, which, when carrying a full load, has proved that it can be driven on the flat from five to fifty miles an hour on the top speed. Moreover, all ordinary hills are mounted with ease on the top gear, on which the drive is direct.

Carburine motor-spirit was used solely by the members of the Midland Automobile Club in their Consumption Trials held on May 13th, in which, as we reported at the time, the winning car made an average of thirty-eight miles to the gallon.

The "Handbook for Automobilists," the second edition of which has just been issued by the Continental Tyre Company, is a handy volume, stocked with useful information, and is rendered doubly attractive by the fact that it can be obtained free (except for sixpence for postage) on application to the firm at 104, Clerkenwell Road. The contents comprise sections on the Motor-car Acts and regulations, the taxes on motor-cars, the automobile clubs in this country and abroad, and, most important of all, a gazetteer, giving an alphabetical list of towns, with particulars of oil and petrol depôts, repairers, garages, electric charging stations, doctors, and hotels. Railway freights, customs tariffs, and European frontier regulations are all described in detail. A list of convenient tours, with a map of Great Britain, completes the handbook, which for comprehensiveness and accuracy is altogether to be commended.

Mr. Andrew Carnegie has placed an order for a 24 h.p. Wolseley, which will be fitted with a specially-designed body of the limousine type. The Wolseley Company also inform us that a further large order for motor-omnibuses for service in London has been placed with the firm. In this connection it is interesting to note that, like the pleasure cars, the Wolseley omnibus, including the body-work, is built throughout by the Wolseley Company.

We illustrate on a previous page an ingenious application of the system of multiple-point contact, fitted to a La Coste type of commutator, by which intermittent misfiring at high speeds is avoided. It will be seen that a small spring ensures firm contact. The adapter, which costs only six shillings, is the invention of Mr. E. H. Lancaster, the exclusive agent in this country for the well-known Clement cars.

Messrs. Humber have generously presented a 16—20 h.p. Beeston Humber car to the Gordon Boys' Home, in order to assist Colonel Purchas in his excellent scheme for training suitable lads in his charge to become motor-drivers.

THE SILENT

LÉON BOLLÉE

Is the Premier French Chassis.

24-H.P. 40-H.P.

SILENT, SPEEDY, and a POWERFUL HILL-CLIMBER.

One of these famous Cars, 24-H.P., fitted with very handsome side-entrance body and ready for the road, for immediate delivery.

A CUSTOMER WRITES OF HIS 24-H.P. LÉON BOLLEE:—

The Manager, Victoria Carriage Works, Ltd. "TUNSTALL, STAFFS., *May 5th*, 1905.

DEAR SIR,—I have very great pleasure in saying that the car quite comes up to my expectations (which were great), and goes better to-day than when I took delivery. Have done over 1,700 miles without a breakdown of any kind, and that is a good enough recommendation, since I am not a *slow* driver. The Bollée is quite up to its reputation.—Yours truly, J. H. FLEMING."

Sole Agents for the United Kingdom:—

THE TEMPLE FLOWER SHOW.

THE flower exhibition in the Inner Temple Gardens seems to be an annual fixture, many years having elapsed since the Royal Horticultural Society, by the kind permission of the Benchers, held its first show in the restful gardens by the Thames-side. One exhibition is very much like another, but the display of this year will be remembered for its freshness, beauty, and brave massing of colours. If we may grumble, it is to direct attention to the absolute want of artistic arrangement. There is an oppressive monotony in these annual shows; but all English exhibitions are the same—a surfeit of beautiful things which must be sought out for close inspection.

MESSRS. PULHAM'S ROCK WORK.

The exhibits were delightful. Orchids, roses, cannas, alpine flowers in bewildering variety, exotics, trees and shrubs, and fruits and vegetables composed this memorable display, and all concerned in its production have good reason to congratulate themselves upon its success. The president, Sir Trevor Lawrence, Bart., the council, the secretary, the Rev. W. Wilks, who, it will be remembered, raised the beautiful "Shirley poppies," and Mr. Wright, the superintendent of the shows, have all worked with energy to achieve this great result. The Temple Show of 1905 was probably the greatest horticultural display the present generation has seen.

The roses were, as usual, a centre of great attraction, and the group from Messrs. William Paul of Waltham Cross contained, amongst other lovely varieties, two plants of the new rambler variety, Lady Gay, which is even finer than the famous Dorothy Perkins. It is an American-raised variety, strong in growth and exceptionally free, the flowers almost hiding the leaves, and the shoots bent with the burden of the large, clear pink rosettes. There is not the slightest doubt that this rose will become as popular as the ever-welcome Gloire de Dijon.

Mr. Charles Turner of the Royal Nurseries, Slough, was represented by the usual beautiful group of roses, the dwarf plants being shown to advantage by pillars and standards of the leading varieties. We noticed in this gay throng the Crimson Rambler, which Mr. Turner introduced to the public several years ago, and the famous La France. Messrs. Paul and Son of Cheshunt occupied their usual place in a corner of the large tent, and we think these well-known rosarians have seldom shown so varied and interesting an exhibit, which comprised not only leading varieties, but a new hybrid tea called David Harum. Then Colchester was represented by splendid groups from Messrs. Benjamin R. Cant and Sons, the Old Rose Gardens, and Messrs. Frank Cant and Co., Braiswick Rose Gardens, in the same town, the last mentioned showing the charming Austrian Copper Briar, which is of all the early summer roses the most welcome. There were roses, too, from Messrs. T. S. Ware, Limited, Feltham; Hobbies, Limited, Dereham; and Mr. George Mount, Canterbury. In almost every exhibit the variety Dorothy Perkins was conspicuous, and its pure rose flowers made bright bits of colour

here, there, and everywhere. It was one of the brightest of the many things in this great show.

The large tent in which the roses were displayed was drenched with perfume not only from the queen of flowers, but also from the orchids, which were shown in great abundance and delightful variety. Messrs. Sander and Co. of St. Albans had a display covering no less than 200 square feet. It is impossible to mention every kind there displayed, but we noticed an exceptionally beautiful cattleya called C. Schröderæ The Baron, of which the flower is as pure as driven snow, except for a lip—or, to use the word of the botanist, labellum—of gorgeous colouring. A plant of Dendrobium thyrsiflorum, too, had no less than fifteen of its pendant, fragrant spikes, a mass of bloom which we have never seen excelled.

MECONOPSIS INTEGRIFOLIA.
(*Messrs. James Veitch and Sons.*)

There were orchids from Messrs. Charlesworth and Co., Heaton, Bradford, the great orchidists of the North; Messrs. Hugh Low and Co., Bush Hill Park, Enfield; Stanley and Co. of Southgate; Bull and Sons, Chelsea; and Mr. Cypher, Cheltenham; while among the amateurs, Sir Frederick Wigan, Bart., and Mr. J. Colman were conspicuous. Although orchids were less numerous than last year, the groups were even richer in rare kinds.

Crowds lingered about the displays of alpine flowers and hardy perennials, and no wonder. Messrs. Kelway and Sons' tree pæonies from Langport are always a source of interest, and this year the big flaunting flowers in many beautiful colourings seemed fresher than ever, and recalled the great splendour of large bushes in the open garden. We always seek their exhibit to refresh our memory of the old varieties, and make acquaintance with the novelties. It has become of late years the custom to show alpine plants on an artificial rock garden, to suggest the way the various things should be placed out of doors, and this is not only instructive, but breaks the monotony of rows of boxes and stands. Messrs. Cheal of Crawley, James Carter and Co., High Holborn, and several others had exhibits of this description.

THE NEW RAMBLER ROSE, LADY GAY.
(*William Paul and Son.*)

It is impossible within the compass of a few notes to mention every exhibit of merit in the wonderful show. The tulips from Ireland were superb, and also from Messrs. Barr

and Sons of Covent Garden, who had also many dainty alpines, poppies, and other flowers of late May. Lilies, primulas, eremuri, and a very charming variety of Phlox canadensis, called Perry's, came from the well-known grower of hardy plants, Mr. Amos Perry, Winchmore Hill, N., and Messrs. Wallace and Co., Colchester, also had an exceptionally fine display, including several of the quaint irises, known as the cushion or oncocyclus, in which the petals are veined and suffused with

GLOXINIAS, CINERARIAS, AND CALCEOLARIAS.
(Messrs. Sutton and Sons.)

exquisite colouring. There were lilies in profusion, and, while looking at the odorous flowers, we realised that summer is at hand, when once again that peerless of all flowers, the Madonna lily, will open its white petals to the sun. The anemones from Messrs. Reamsbottom, Geashill, King's County, Ireland, have been seen on previous occasions, but we are always pleased to renew acquaintanceship with this race of flowers. Messrs. George Bunyard and Co. of Maidstone are more famous for their fruit than for hardy flowers, but a charming little display of alpines deserves mention.

Near the principal entrance Messrs. Pulham of Broxbourne, the well-known makers of rock gardens, had an elaborate display, which proved one of the most important features of the show. It was a most instructive and well-planned exhibit, and deserves hearty praise. Mr. Notcutt brought from Woodbridge his salmon-orange-coloured poppy Lady Roscoe, a flower of great delicacy and beauty.

The exhibits on the lawns were more beautiful than usual, and we are pleased that the council have determined to make an open-air garden, as much as possible, of the Temple Show. Owing to a want of ventilation the tents are uncomfortably hot, and the sultry weather, especially of the first day, made a tour of the tents almost impossible. Grouped on the lawns were the exhibits of Messrs. James Veitch and Sons, Limited, of Chelsea. There were pæonies, primulas, and the towering spikes of Eremurus robustus elwesianus, which were worth a long journey to see, but the keen gardener was, perhaps, most interested in the new meconopsis, M. integrifolia, from China. This firm has accomplished a great work for horticulture in sending out Mr. E. H. Wilson to explore the wilds of Eastern Thibet. Messrs. Veitch also had several other classes of flowers—caladiums, crotons, ferns, and azaleas. Messrs. R. G. Cuthbert, Southgate, N., had beautiful azaleas.

The Veitchian Cup, valued at fifty-two guineas, and given for the most meritorious group in the show, was awarded to Messrs. Thomas Cripps and Son, Tunbridge Wells. It consisted chiefly of maples, but we noticed amongst other things the golden elm and the golden oak.

A bright splash of colour was seen in the display from Messrs. Fisher, Son, and Sibray, Handsworth, Sheffield, the well-known rhododendron Pink Pearl having many clusters of its clear, soft, rosy flowers; but quite as worthy of note was a rhododendron called Doncaster, which is of a bright crimson shade, and very charming. Ilex Wilsoni, one of the finest of the hollies, was also shown. Almost opposite this group were the curiously-cut bushes from Messrs. William Cutbush and Sons of Highgate. The group was quite an object-lesson in topiary work, and it was a happy coincidence to find the large collection of pigmy trees, from Messrs. Barr and Sons of Covent Garden, a few yards away. The two classes have much in common.

The maples and other things from Messrs. R. Smith and Co., Worcester, made a great show, and also represented by groups on the lawn was Mr. Russell of Richmond, Surrey.

Messrs. Sutton and Sons of Reading had a magnificent display. It consisted of their graceful Stellata cinerarias,

GENERATION OF ELECTRICITY BY

"THE ORIGINAL S.S." SUCTION SETS.

The earliest of our installations with Suction Gas Plant has been working successfully

SINCE 1899—

being one of the first installations erected on this principle in England.

Suction Gas Producer.

Test of a Typical Electric Lighting Plant, from August 6th to November 5th, 1904, 1628 units used, 330 lights fixed, showed a cost for fuel consumption of about ONE-THIRD OF A PENNY PER UNIT generated.

N B.—The results usually published are apt to be misleading, for they omit such items as loss in conversion, labour, oil, etc., which will raise the total working cost to about twopence per unit.

2d. per unit is approximately equivalent to lighting by coal gas, at 1/6 per 1,000 cubic feet.

A unit equals 15 lamps of 16 c.p. burning for one hour.

PRACTICAL ENGINEERS are sent, free of charge, to obtain particulars and advise generally.

THE FIRE IN SUMMER.

THE WELL FIRE

(BOWES' PATENT)

FOR COAL, LOGS, OR PEAT.

The sudden and violent changes of weather during the British Summer necessitate fires almost all through the season. The Well Fire is the cheerful old style hearth fireplace constructed on a scientific plan. It is fitted with a fire-brick well chamber, which throws out just the desired supply of pure warm air.

NO DIRT. The only fireplace with the fire-brick well. It burns brightly all day without attention. The Well Fire is a boon in our variable climate.

NO FUMES.

THE WELL FIRE BOWES' PATENT TRADE MARK

NO LABOUR. Extensive range of artistic designs adaptable to any fireplace always in stock. Every genuine Well Fire bears this trade mark :—

Particulars and Illustrations free on application.

THE WELL FIRE CO., LTD., DOVER ST., PICCADILLY, W.

LIVERPOOL: 34, Paradise St. MANCHESTER: 16, John Dalton St.
LEEDS: 7, South Parade. EDINBURGH: 8, George St.
GLASGOW: 157, Hope St. (Well Fire Depot). NEWCASTLE-ON-TYNE.

calceolarias in many rich colourings, gloxinias, and schizanthus, delightfully set off by maidenhair ferns and the pretty little Caladium argyrites. The cannas from Messrs. Cannell and Sons of Swanley were gorgeous, and a blaze of scarlet, crimson, and gold. Messrs. Cutbush's and Hugh Low's carnations, the clematises from Messrs. R. Smith and Co. of Worcester, the rhododendrons from Messrs. J. Waterer and Sons, Limited, Bagshot, Surrey, the lilies of the valley from Mr. Jannock and Mr. W. Iceton, scented the air with their fragrance.

The Temple Show is for the most part one of flowers, but it would not be complete without the fruits from Messrs. T. Rivers and Sons of Sawbridgeworth. Their new peach, Peregrine, will be the joy of the garden in the future; its flavour is delicious. Messrs. Sutton and Sons had a remarkable exhibit of forty varieties of potatoes from tubers planted on March 1st, and the strawberries from Messrs. Laxton Brothers, Bedford, were tempting. Bedford Champion and Reward are two novelties of great promise. Messrs. Bunyard and Co. had a collection of no less than eighty-five varieties of apples in excellent preservation, and a cherry named Guigne d'Annonay, the chief merit of which is its earliness. Messrs. Cannell's vegetables were, as usual, remarkable for their even quality. It may be interesting to know that of the many awards made by the judges, the following each received a gold medal: Sir F. Wigan, Bart., for orchids; Sir A. Henderson, Bart., M.P., for fruit and vegetables; Messrs. James Veitch, for stove, hardy, and new plants; Messrs. F. Sander, for orchids and nicotiana; Messrs. Cutbush, for carnations and alpines; Messrs. Paul and Son, for roses; Messrs. Charlesworth, for orchids; Messrs. Cripps and Son, for shrubs; Messrs. Sutton and Sons, for greenhouse plants; and Messrs. Wallace and Co., for alpines and lilies.

JUNE MAGAZINES.

THE *Fortnightly* for June has, in addition to the usual supply of political articles, several papers of very great interest to the lover of literature. The number opens with a discourse by Mr. L. Higgin on Alfonso XIII. of Spain, which is varied by a few of the stories that usually spring up about Royalty. Here is a fair example:

"Many were the stories told of his childhood; one, which is well known, shows so much the characteristic determination of his later years that it is worth repeating here. While still a child in the nursery, his governess rebuked him for putting his knife in his mouth. 'Gentlemen never eat like that,' she said.

'But I am a King,' remarked the child.

'Kings still less put knives in their mouths,' said the governess.

'This King does,' was the reply."

And here is another, which perhaps is legendary:

"The Royal children were playing in the gardens of the Palace, which overhang the steep decline to the Manzanares, the resort of the laundresses of Madrid, whose children may always be seen playing on the banks while their mothers dam up the river water and cleanse their linen in this primitive wash-tub. Down below was a group of these poor children playing, probably at bull-fight, in which game one boy will be ferocious in a pair of horns made of sticks with the curled shavings from a carpenter's bench twisted round them. After a time the group dispersed, thinking of some fresh game to play, and all ran away but one little girl, who being lame could not keep up with them. Finding herself alone and deserted, the little mite leaned against the wall, sobbing as if her heart would break. The King, who had been watching the game, became furious; he would do all sorts of dreadful things to the selfish runaways, and insisted that his gentleman-in-waiting should go down to the deserted child and bring her up to him. This was done; the Royal children gathered round her and persuaded her to tell them her sorrow, while they consoled her with their own toys and various good things dear to small people. The Queen-mother, who was by this time on the scene, approved of all her boy had done, and suggested to him in addition that, as the child was lame, they should send for her parents and try to find out if something could not be done to cure her, or, if not, to provide anything that might be necessary to make the best of her calamity. This was done, to the great delight of the King, and permanent provision was made for the future of the little cripple."

Mr. F. G. Bettany writes a vigorous article in praise of Anthony Trollope's novels. Apparently he is under the belief that this novelist is in the way of a revival. It is interesting to hear his views, though for our own part we disagree with him. Trollope enjoyed a reward in his own day and generation, but he was not a great writer. He was what has been said of him—Thackeray with all the poetry and all the philosophy of Thackeray left out; and, for our own part, after making several conscientious attempts to re-read him, we had to give it up in despair. Still, we reproduce Mr. Bettany's belief for what it is worth:

"If only contemporary novel readers knew what a full and exact picture of their fathers' days, what an array of entertaining and convincing types of humanity, what storehouses of humorous invention and shrewd analysis lie buried behind the covers of the yellow-backed novel or clumsy 'three-decker' which on some bookseller's stall, maybe, bears 'old Anthony's' signature, they would turn from their many modern story-tellers to the man whom such have often imitated, and there would be no longer any ground for talking of the neglect of Trollope."

Mr. Maurice Gerothwohl writes a very learned paper on the "Ethics of Don Juan," full of history, but somewhat lacking in understanding of the philosophy of the matter. If we would thoroughly apprehend the idea of Don Juan as it is imaged in the works of many different writers, we have to remember that monogamy is a very artificial arrangement which probably is

Burberry-Proof Materials

are subjected to a series of processes in different stages of manufacture, rendering them permanently rain-resisting without blocking up the air spaces.

URBER COMBINATIONS

Gamefeather Tweeds, lined throughout with Silk (both Rainproofed), make Lounge and Norfolk Suits and Sporting Gowns which out-distance all previous efforts for appearance and comfort.

SMOKE MAY BE BLOWN THROUGH ANY PORTION OF THE CLOTH.

A BURBERRY GAMEFEATHER (Urber Lined) **SUIT** appeals strongly to luxury lovers. Its quality is the finest. Its colouring and pattern uncommon and artistic. Its rain resistance effective, and its ventilating properties perfect. Its construction permits the greatest limb freedom, and its design is unequalled for comfort. It affords, in fact, for Sport, Travel, and Country Wear the acme of perfection from whatever viewpoint it is criticised.

A SUMMER LUXURY

is Burberry Half-Mesh Tweed—a cloth of very fine texture, which is formed in alternate squares of dense and open weaving. Cooler and Lighter than flannel, it is the best Tropical Sporting Suiting available. Invaluable for Boating, Golfing, and Travelling Lounge Suits, and for shooting in hot weather.

BURBERRY-PROOFS

embody all that is known of the art of making weatherproof wearing apparel without violating — as oilskins do — the first principles of healthful ventilation.

GABARDINE COMBINATIONS

provide the best materials for rough weather and rough work. For Fishing Suits and Gowns it is the finest stuff in the world. Fishhooks never hang up in it, and it is practically indestructible.

RAIN RUNS OFF LIKE DEW FROM A LEAF.

BURBERRY RIDING LOUNGE AND BREECHES.

The Coat, graceful, easy fitting, is fairly long to cover well over the saddle and avoid the chance of working under. An excellent garment for hacking and wear in the park.

A BURBERRY SLIP-ON is the most efficient overgarment to be had for money. Combining LIGHTNESS and PROTECTION from all forms of wet with perfect NATURAL SELF-VENTILATION, it meets the wants of the Shooting, Golfing, Racing, and Country Gentleman, while Automobilists, Anglers, Mountaineers, and Yachtsmen and Women all acknowledge the soundness of the comforts it affords. It has greater advantages and fewer faults than any other coat known.

"The principle of the SLIP-ON is a fine freedom everywhere, which keeps him dry and unfettered during a hard day's work in the rain."—*The Field.*

"The SLIP-ON is the coat of all others for the sportsman or sportswoman. It is absolutely Rainproof without being stuffy or chilly."—*Country Life.*

"I have had several of your SLIP-ON coats, and as a country doctor I have found them very successful in every respect, and since using them I have practically discarded all mackintoshes, and have recommended your coats to several of my friends and patients, and they all speak very well of them."

BURBERRYS, MOTOR AND MILITARY DEPTS. **30,** SPORTING DEPT. **31,** LADIES' DEPT. **33, HAYMARKET, LONDON, S.W.**

for the good of society, and, therefore, is all worthy of observance; but the beast that is in man will at times tend to revolt against it, and when an individual does so revolt there is enough sympathy to make the episode amusing.

Among the things that might be better left out of the *Fortnightly* might be numbered, we think, "Time's Abstract and Brief Chronicle," by Mr. G. K. Chesterton. It is a sort of conversational commentary on the topics of the hour, and how much refinement and elegance it contains may be judged from the following extract:

"My view of female suffrage is, that if it were conceded it would make absolutely no difference at all. There are the same kind and the same number of Conservative she-donkeys as there are of Conservative donkeys. There are the same type and number of Progressive Radical pigs as there are of Progressive Radical sows. As long as your whole community is dominated by gentility and social needs and modern refinements, in a word by false goods, you will not find any sensational difference between the sexes on that side. If you have a snobbish society, you will not find that the women will, to say the least of it, be less snobbish than the men. They could not well be more."

Mr. F. S. A. Lowndes writes pleasantly about the "Literary Associations of the American Embassy," and Laurence Binyon contributes a characteristic piece of verse on Paris and Œnone.

In the *Cornhill* there is an article full of gusto by Alexander Innes Shand on "Gastronomic Divagations," from which we take the following appetising little passage:

"You land your six or eight pound grilse shortly before dinner, silver-scaled, fresh run, and covered with the sea-lice. You crimp him on the bank, plunge him again in the chilly water, and then send him to the lodge by swift messenger. As Mrs. Poyser sensibly remarks, it is a poor thing when the flavour is in the cruets. Sprinkle with parsley, serve simply in the water in which he was boiled, with, perhaps, a dash of anchovy and some faint suspicion of chili; but that may be matter of opinion."

The *Independent Review* is, as usual, extremely political, but it contains one or two articles of interest to the general reader. As an example we may refer to Mr. G. G. Coulton's "Catholicism and Morals." Mr. Coulton is in the way of engaging Dr. Barry in a controversy, and in the course of his arguments he is not afraid to stick up for the people of his own generation. He says:

"Even the slight tendency of certain crimes to increase in recent years leaves us still out of all proportion better than our ancestors of 600 years ago. I will review briefly all the crimes of which Dr. Barry complains. By two independent calculations, from coroners' rolls of Oxford and Bedfordshire, I get at the same result—that the percentage of murders and homicides to the total population of those days was *more than twenty times* greater than at present. With rape the disproportion is greater still; for it was a habitual practice in warfare, and when was Europe without war? Even nowadays it is in Romanist countries that gambling is especially rampant; in the Middle Ages it was far worse, and rendered even chess a disreputable game. St. Bernardino complains of the horrible blasphemies and mutilations of saints' images to which the gambling mania led—far worse than anything known to modern Protestantism. Drunkenness, even without the worst modern temptation of distilled liquors, was also rampant in the past; at Oxford, as Dr. Rashdall points out, it was not even an offence recognised by the University authorities. As to obscenity, I dare not even summarise the testimony of Thomas of Celano and Gerson, which points to something far beyond modern France and Italy. One of St. Catherine of Siena's worst trials lay in the impossibility of escaping from foul talk in respectable middle-class circles. There is scarcely a book of mediæval history or fiction, even including the collections of anecdotes for preachers' use, which could conveniently be published in an unexpurgated translation."

The only other article requiring attention here is that on "The Agricultural Labourer" by B. Seebohm Rowntree. Most of the ground has been gone over before. This is the conclusion at which Mr. Rowntree arrives: "There is no doubt that the lack of outlook in the case of the agricultural labourer is a most important cause of rural depopulation. If an intelligent and energetic man knew that, as the result of hard labour and thrift, he would be able to become a small peasant proprietor, then the towns would exercise less attractive force for him, and the best men would be willing to stay in the country."

The *Monthly Review* has several general articles of considerable importance. Readers will be glad to find "The Goddess of Wisdom and Lady Caroline Lamb," by Mr. Rowland Prothero. Mr. Forrest Reid writes on "Edward Dowson," and Mrs. Hessey has quite an amusing paper called "Quaint Memories." Of these we quote the following sample:

"A cousin of mine went to take duty in a remote hamlet in Lincolnshire. He was astonished to find a great part of the west end of the church, under the tower, stacked almost to the roof with faggots. He told the clerk, after service, that he hoped they would be taken away, anything so unseemly could not be allowed in the church. 'Lor' sir! Muster A——' (mentioning the farmer's name), 'would never hear of they faggots being moved. Why, they do make capital ferreting. There's a wonderful lot of raggits gets in there, and beautiful sport 'tis, too, I can tell you. No, 'twould never do to move they faggots!' In the winter my cousin would often receive a message from the farmer saying it was so cold that nobody would go to church to-day, but if Muster Paul liked to come there'd be no objection to his having service in the kitchen."

The *National Review* is an exceptionally good number. Her Majesty the Queen of Roumania discourses upon "The Vocation of Woman." Dr. George Brandes, Mr. Filson Young, Mr. Maurice Low, Lord Egerton of Tatton, Mr. Churton Collins, and Dr. Cunningham all write interesting general articles. Perhaps the most interesting, from the point of view of listening to candid opinion, is that of the German's candid impression of England. The nature of these reflections may be judged by the following extract: "One result of your education without religion has been to implant in the working class a spirit of envy of all who are better off than themselves. We have this spirit, too, to some extent, though with us it is not so mischievous, since, despite the belief that Socialism is a peculiar peril to Germany, it has gained far

SKIN LIFE

Cook's THRONE SOAP adds life to the skin!

less power with us than with you. Your workers are determined to level down, not to level up; they would drag down the industrious and energetic to the standard of the idler and the shirker. It is within my own knowledge that wages have recently risen in England to a degree beyond the advance in productivity, so that your labour is paid more and produces less. Whether it is the Trade Unions, or whether it is the physical weakness of your city-bred population, I do not know, but both causes may be at work. In any case, this is a serious danger for England, inasmuch as with us, though wages have immensely advanced in recent years, the output of the worker has increased in even greater ratio."

POLO NOTES.

THE Ranelagh management are steadily carrying out the extensive programme which appeared in COUNTRY LIFE early in the season, and a strong club team has once more made its appearance and played a fine match, which was probably the game of the week, against Roehampton on Monday: Ranelagh—The Hon. A. Hastings, Captain L. C. D. Jenner, Mr. F. A. Gill, and Mr. A. Rawlinson; Roehampton—Mr. W. Jones, Mr. G. A. Miller, Captain E. D. Miller, and the Duke of Roxburghe. The two sides played very evenly, first Ranelagh and then Roehampton scoring, so that the score was 2 all at half time. In the fourth period Ranelagh went ahead again, and made two goals in quick succession. Then came the two pretty bits of combined play in which Mr. Walter Jones took a leading part. The Duke of Roxburghe, riding hard and hitting well, came right up through the game and looked like scoring, till Mr. Rawlinson, whose resolute style of riding off we all know, stopped him. Then in the nick of time Mr. Walter Jones dropped on the ball and hit through. Again in the last period, when the ponies were fairly extended and every player was doing his utmost, Mr. George Miller made a very clever pass to Mr. Jones, who, on a fast and very perfect pony, was never caught until he had scored the winning goal (the scores were previously 4 all) by a somewhat difficult angle shot. Thus Roehampton, with a little the best of the luck, for Ranelagh had two fouls given against them, and some excellent play, won by 5 goals to 4.

The Murrayfield ground laid out by Mr. T. B. Drybrough in 1889 was the first ground in England to adopt the slope inside the boards, which, on a boarded ground, is so useful to prevent the ball hanging under the guards. It was when the late Mr. Moray Brown was on a visit to Edinburgh that he saw the slopes, and he introduced them at Ranelagh in 1895.

It is very interesting to note the excellent class of polo ponies now being used. There are this year few important studs with foreign ponies in them, and one seldom sees Argentines or Americans in first-class polo. As for the Arab, he has almost disappeared from the field, though a few Anglo-Arabs by such well-known Eastern sires as Mootrub and The Bey are playing. But English and Irish breeders are now supplying the needs of the market, and prices, though good, are not extravagant. Among our native breeds, the Welsh pony has the lead. Mr. Coltman Rogers, the editor of the Welsh Stud Book, thinks that quite 30 per cent. of English polo ponies have Welsh blood in them. I hope to write more in detail about some of the notable studs and the ponies of the year. In the meantime, I should like to note that hand in hand with the great improvement of the average player at polo has been the increase in the number of ponies of high quality. Indeed, as far as looks go, there is not much difference between the ponies used by some of our first-class players and those of the rank and file, the superior training, handling, and horsemanship in the former making the most of the natural aptitude of the pony. Probably such animals as Old Dutch, recently sold by Mr. Waldorf Astor for £300 at Tattersall's, My Honey, the property of Mr. J. B. Dale, and such old friends as Luna, Siren, and others, belonging to Mr. Walter Jones, would be good anywhere. Captain Miller's Worcester, Mr. Garland's Sir Horace, and Captain Phipps Hornby's Constance (lately sold) are ponies which can hardly fail to make their name. Other ponies there are which, though their career may be cut short by accident, like Whalebone, find a useful end in a stud. I understand the last named has gone to one in Devonshire. One cannot be accused of too much optimism if we conclude that while our first-class players are at their best, the polo players in the London clubs were never so well mounted on home-bred ponies as they are this season. X.

FOR TOWN & COUNTRY.

BOTH the Town Mouse and the Country Mouse, when they belong to the feminine gender, need to preserve their complexions—most precious of all beauty-gifts to a woman; and both will, therefore, prove that mice can be wise as well as men, if they put themselves in the hands of Mrs. Pomeroy, the well-known complexion specialist of New Bond Street. The Town Mouse can go to Mrs Pomeroy's charming rooms and have a course of face-treatment which will result in a delightful rejuvenation of appearance; and her country sister, though deprived by distance of Mrs. Pomeroy's ministrations, can yet do wonders for herself under the instructions she can obtain with the necessary toilet articles, which Mrs. Pomeroy will also supply to meet the requirements of each case. It is wonderful what results can be obtained under Mrs. Pomeroy's expert advice even at a distance; though naturally a course of her treatment is more effective still if the applicant can call personally at the establishment in New Bond Street.

Those who are thinking of redecorating their houses should write beforehand to Messrs. Sissons Brothers and Co., Limited, of Hull, and 199B, Borough High Street, London, S.E., for one of their most enlightening booklets, "Modern House Decoration," wherein are set forth the manifold advantages, both sanitary and æsthetic, to be obtained by using Hall's Sanitary Distemper. The illustrations in colours give a most admirable idea of the effect of the distemper in the different rooms of a house, and nothing could be more decorative and harmonious than the dining-room with walls of burnt orange, frieze of warm yellow, and ceiling of cream, all blended and harmonised by the woodwork treated with Hall's "Sisco" white Japan. There are seventy colours and shades to select from, and apart from its practical and economical

IZAL

This powerful

DISINFECTANT

is truly a household necessity. The danger to health—even to life itself—constantly lurking about the house (arising from drains, sinks, traps, w.c.s, dust-bins, etc.) can be removed by the daily use of IZAL, for flushing, etc., purposes.

Officially Adopted by His Majesty's Government.

IZAL (which is non-poisonous to human beings and to animals) affords certain immunity from contagious diseases (including typhoid and other fevers, diphtheria, small-pox, etc.), to the germs of which it is fatal.

Sold everywhere at 6d., 1/-, 2/6, 4/6.

1/- Bottle makes 20 Gallons.

(Only as much need be made at a time as is required.)

Send for "The Izal Rules of Health," a valuable little work of 50 pages edited and revised by Dr. ANDREW WILSON. Forwarded FREE on receipt of application addressed:

Dewar's

The Whisky of MANY Merits.

advantages Hall's Distemper lends itself to the production of fine decorative and artistic effects, which have been appreciated by many eminent artists in the decoration of their houses and studios. People are rather apt, when planning the decorative scheme of a house, to overlook the fact that when walls are treated in light tones there is far less expenditure in artificial light necessitated; and also that rooms thus treated look larger and more airy than when decorated in dark or pronounced colours. Walls require no preparation for Hall's Distemper, which can be used with a saving of 80 per cent. in the cost of materials and labour. The distemper is durable, washable, and not affected by light, heat, or gas fumes, and consequently long outlasts ordinary oil-paints. It can be applied over a wall-paper, or on new and damp plaster, and is so simple in use that unskilled labour only is required for its application. It should, therefore, be found a boon to all householders both in town and country; and its many merits will be at once realised on a perusal of Messrs. Sissons' booklet.

Those who wish for a more permanent remembrance of their relations and friends (not to mention themselves) than they can hope for from photography, should look at Miss Edith Maas's charming miniature in the New Gallery Exhibition. Miss Maas's work is unusually good, being treated with a breadth and directness not often to be found in modern miniatures, which are usually stippled and photographic; and those who would like to see other specimens of her work should apply to her at 11, Hollywood Road, South Kensington.

One of the most noticeable features of this season is the popularity of the hotels. House agents and proprietors are tearing their hair, and meditating a period of seclusion in the most hospitable workhouse available; but the hotels are turning people away daily from their doors, as they are full to overflowing. One of the most popular of the great London caravanserais is the Hyde Park Hotel, and this is not much to be wondered at, seeing its unique situation, overlooking Hyde Park, and the great comfort in every detail which the most capable management secures to its visitors. It seems hard to believe, when one is in the unusually lofty and spacious rooms of the Hyde Park Hotel, that one is in the centre of the most bustling part of fashionable London, so delightfully quiet and reposeful are the surroundings, while the outlook from the terrace over the Row and the Park is quite sufficient to account for its popularity as an afternoon-tea resort. The ballroom suite is almost too well known to need comment, for many are the London hostesses who appreciate the convenience of giving their balls and receptions in these palatial rooms, which, having a separate entrance, are completely private.

Shank's patent motor-mowing machines are of the greatest value in the garden, especially the splendid machine which has proved so successful on Lord's Cricket Ground. This is made to cut 42in., and it weighs 19½cwt. It is fitted with a reversing gear, and by this means it can be stopped, backed when necessary, and restarted without stopping the engine. As the front portion of the machine is hinged and free to move, irregularities in the ground are no obstacles to the cutter, and this is a point worth special attention. The driver can also throw the cutter out of gear, and raise it from the ground by means of hand-levers. As Messrs. Shank well say, "These facilities are most useful when backing the machine or clearing an obstruction, and they safeguard the cutter and, indeed, the whole machine from shock." Not only is this motor machine a perfect grass cutter, but it acts also as a roller, the weight being concentrated over the main drum. When it is to be used as a roller the cutting portion is raised by lever clear of the ground. As may well be imagined, this machine is of the greatest use in keeping in condition a large extent of lawn, and also for polo and cricket grounds. Its price is £180.

The Safety Water Elevator Company of 104, Leadenhall Street, E.C., have been lately showing at the Builders' Exhibition at the Agricultural Hall a water elevator which does away with both the drawbacks of the old open well and village pump. Two buckets, working over a wheel on a steel rope, empty themselves automatically as each arrives at the top into a channel that feeds the spout. They take the water in through apertures in their bottoms, closing or opening by a valve which is operated on by levers working from the top of the bucket. The wheel over which the rope runs is worked by handles, one geared down to suit the strength of women and children, the other, of a higher gear, for men, and a clutch is ever ready to hold the wheel when the handles are let go. Altogether the mechanism seems solid, simple, and effective, and the price brings it within the reach of anyone owning house property or the parish meetings of the smallest villages.

WATER ELEVATOR.

The Great Western Railway, whose main lines to the West Country provide perhaps the most luxurious travelling to be had in England, seem to us to owe this superiority in a great measure to the excellence of the track and to the extra width of the seats, as well as the slant at which they are fixed, and other companies would do well to make a note of both these points. Their Whitsuntide programme is as elaborate as ever, and tourists have the advantage of starting from a station which can bear any strain which even a Bank Holiday crowd puts upon it without being unduly crowded.

The North Western Railway has long been noted for its comfortable journeys to Scotland, and now that tourists are more and more learning what pleasant holidays may be spent in Ireland, they will be glad to learn that special arrangements are made for their transport from Holyhead to Dublin direct by the same company, which will enable them to avoid the change, always irritating after a rough passage, at Kingstown.

Socks descending over one's pumps do not add to the picturesqueness of ballroom attire, and the "Boston Velvet Grip" Garter is one of the many appliances devised to prevent such a catastrophe, and seems likely to be useful.

THE GROWING TASTE FOR ENGLISH WORK of the XVIIIth CENTURY.

THE Georgian styles are often referred to as the English Louis XIV., but it would be more correct to say that the wave of taste which started from Italy left its influence in France in the great artistic epoch of Louis XIV. and passed on, leaving England to evolve from the same source what are termed its Georgian styles. In the latter case, the designers being less directly under the influence of the Renaissance and less refined, produced an equally original type from it, while less light and graceful, and less extravagant.

These fine examples of English work of date about 1700 are said to have been in the room in which King George II. died. The table has some interesting initials in the corners.

The patrons of art in France had greater facilities and inducements to call to their aid the great Masters in Sculpture, Architecture, and Decoration than those in England, where the refined work of Sir Christopher Wren and Inigo Jones had laid the foundations of the finest period of English architectural taste since the Gothic. This influence has never been quite lost in France, except during the dangerous wave of the Art Nouveau, but in England it lasted until the unscholarly and Early Victorian taste had full sway. However, England and America have again discovered what a charm attaches to the English homes of the early XVIIIth Century, and each fine example of furniture of that time, as it appears in the market, is eagerly bought up by connoisseurs. The illustrations accompanying this are further examples of some of the fine models used in Messrs. White, Allom & Co.'s Studios to enable their designers and carvers, in carrying out decorations and works of this type, to keep as near to the original character of the old work as possible. Amongst these, special attention may be drawn to the old Mirror and Table from the room in which George II. died, and to the fine Table at the bottom of the page, which is one of the rare cases in which French work of Louis XIV. time had a very direct influence upon English work, and the example is one which is in all respects equal to the best that France produced. These old Tables are at 15, George Street, Hanover Square, in one of the old rooms in Messrs. White, Allom's Offices, amongst a most interesting collection of models of some of the most beautiful English and American homes, most of which have been completely carried out in miniature before being handed over to the workmen to execute. This system of modelling the design to a small scale was adopted by most of the architects of the late XVIIth and early XVIIIth Centuries, and was the key to the wonderful success of their buildings. These models, together with the many beautiful examples of old carving which Messrs. Allom's factories contain, enable their craftsmen to produce work in many cases hardly distinguishable from the old, and they form quite an interesting museum of the finest English decorative period.

A curiously exaggerated form of Cabriole leg with hoof feet of Queen Anne period. From Mr. Allom's collection of models.

An example of the most refined Georgian work from Mr. Allom's carvers' models.

This though an English table is so closely similar to the type designed by Marot in France, that many experts would take it at first sight for French workmanship.

SPECIAL STUDY MADE OF
MOTORING & YACHTING COSTUMES.

Conduit St. & Bond St., LONDON. Rue de Rivoli, PARIS.

WEDDINGS are in the air; and June this year seems likely to break its record as the month of marriages. It is a wonder that so little originality is shown in the majority of bridal dresses, for, as a rule, competition provokes a desire to "go one better"; but brides seem to be content to repeat the themes of satin and chiffon until one has arrived at such a point of indifference that I own to returning from a big wedding a few days ago, and having nothing more to say about the bride than that she was in white! Few if any costumes afford such decorative and effective opportunities as does that of a bride, and yet how many bridal dresses can one remember which showed the smallest spark of originality or intention! Lady Helen Vincent is almost the only exception, and I can remember the sort of hushed amazement which greeted the appearance of her wedding train embroidered in great white lilies, the leaves being given in their natural tones of pale green. The effect was exquisite; and if anyone could have inaugurated a novel fashion, it should have been the marvellously lovely wearer; but, as a fact, no one followed the fashion set with such absolute success. However, Miss Marjorie Nevill, who was married last week to her cousin, also tried to break away from the prevailing monotony to which brides seem to be condemned, for she actually had the courage to relieve the effect of her charming dress of white tulle with a train of gold tissue lined with tulle, and trimmed with golden roses. Her slender waist was encircled with a golden girdle, which fell to her feet with golden tassels. The effect was exceedingly original and effective, and gave a certain regal air which should certainly emphasise a bride when possible. The bridesmaids repeated the same mixture of colour in their dresses of white silk voile, with picturesque Louis XV. long-skirted coats in white lace, strapped with gold galon, which also formed the corselet belts, fastened with Louis XV. buttons in gold. The hats of white crinoline had crowns of gold tissue; and golden shoes and gold-coloured stockings completed the picturesque effect. As a rule all-white bridesmaids' dresses do not advantage that of a bride. They swamp her, which is just the reverse of the effect that should be produced; for the bridesmaids should be considered from the point of view of a becoming relief and background to the bridal toilet. A very pretty fashion is that of putting the bridesmaids by pairs in different pale colours; and I would suggest another idea, which I have never seen tried, but which I am certain would be most effective, and that is that the pairs of bridesmaids should "shade" from dark to light of one colour. For instance, the pair next the bride might be in palest possible rose, the next pair in a fuller shade, and so on to the last pair in ruby rose, each pair having bouquets of roses to match the tint of their gowns. Imagine the beauty of such a background of shaded colour to the pure shimmering white of the bride's dress! This is an idea of my own, but I present it to any of my readers who meditate committing matrimony this summer, when it would be particularly appropriate, as shaded effects are so fashionable. The same idea could be carried out in any colour; in green from palest tilleul to laurel, in blue from forget-me-nots to cornflowers, in yellow from palest citron to mandarin orange. Another innovation I should like to suggest in wedding ceremonies is that the bridesmaids should precede the bride up the nave, not follow her. The bride is the queen of the day, a brief sovereignty, so she should make the most of it; and in all Royal processions the Court precedes Royalty, and does not follow after. If the

LINEN OR DRILL COAT.

bridesmaids preceded the bride and placed themselves in a semi-circle at either side of the chancel steps, the effect, especially if they were in the shaded dresses I have suggested, would be infinitely prettier and more effective than when they are wedged together in a narrow line between the seats of the congregation. This plan would also allow a far better sight of the bride and a possibility of appreciating the beauty of her dress; as it is, her effect is immediately swamped by the bridesmaids following quickly and closely after her, and spoiling the view of her train and its tiny bearers, which, if the bridesmaids preceded her, would then be seen to perfection.

Talking of weddings reminds me of some of the pretty things which have been made for Princess Margaret, now of Sweden and Norway. The papers have been full of descriptions of her wedding and travelling dresses, so it is unnecessary to speak of those. More interesting is it to chronicle some of the charming dresses which were made for her by Paquin of Dover Street. The Princess showed her wisdom in ordering several beautiful black toilettes from this famous firm. A lovely evening dress was in black tulle, whose foamy density of tint was heightened by very light embroideries of sparkling jet; the bodice had folds of black velvet with incrustations of white lace, crossing fichu-wise over a dainty little chemisette of white spotted tulle. To go with this dress was a beautiful mantle of black Oriental satin and black silk embroidery in high relief, the lining being of white satin with bouillonné's of white silk muslin relieved with white ribbons. The same beautiful black Oriental satin formed another charming gown trimmed with black mousseline de soie and black guipure, a little vest of white appliqué lace giving a becoming relief. A beautiful evening cloak was in pale blue Oriental satin, made very full and voluminous, as the fashion is, trimmed with bands of embroidery in pink, gold, and pale blue, and lined with pale blue mousseline de soie. To an entirely different category belonged the delightful little tailor-made gown in aubergine cloth, strapped with a design in the same material, an original note being given by a vest of yellow cloth, and some very beautiful old porcelain buttons.

Now that we are in the midst of the smart racing season, the need of ornamental yet useful coats is brought home to us daily; and I am, therefore, giving a design of one which, whatever its undeniable beauty and comfort, cannot be accused of being aggressively luxurious in material. For this charming coat is made in white linen, about the strongest and most serviceable material that exists for summer wear. It is cut in the prevailing Empire fashion, with a close-fitting short bolero as the upper part, into which the long full skirts, which can be comfortably folded over the dress, are set in folds. The bolero and the quaintly-cut collar and revers are outlined by a band of coarse white cotton embroidery in high relief; and the same embroidery continues down the fronts, and forms cuffs to the plain, full elbow sleeves, which are finished off with ruffles of lace. The horizontal folds of the big sleeves on the shoulder should be noticed, for they give the indispensable width required not to crush the high puffed sleeves, which are so effective and becoming a feature in all our summer dresses this year. A coat like this would not only preserve from dust, but is exceedingly smart and becoming, while still having that practical workmanlike air required of such a garment; and it has the further advantage of cleaning like the proverbial handkerchief. As we are on the subject of workmanlike garments, I also give on the previous page a sketch of a charming little coat in linen or white drill—just the thing required for river wear at this time of year. It is cut with a short basque, which stops at either side in front, where there is an original loose vest, with points of Chinese embroidery in dull blue tones on the inside, which can be worn open and turned back to display this embroidery, or crossed over and closed. A stitched band edges the basque, and is continued up the dart line at either side in front to the shoulder, whence it descends the outside of the sleeve and marks a double cuff at the wrist. Gold buttons ornament the fronts and the cuffs; and a particularly smart effect is given by the collar of blue velvet of the same tone as the Chinese embroidery. The same blue is repeated in the cravat and in the satin bows of the dainty little hat in Manilla straw, caught up with a couple of white wings. Such a smart little costume demands a pair of the fashionable coloured buckskin shoes, in the same tone of blue, for shoes to match the dominant note in a costume are the latest edict of fashion. No smarter fashion was ever invented than this; it gives a dainty completeness to a costume that cannot be over-estimated.

WHITE LINEN DRESS CLOAK.

The shopping of the King of Spain, our latest guest, was mainly directed to the purchasing of those charming novelties in leather and silver which are so peculiarly an English speciality. Foremost among those who have made a name in this class of goods is Mr. Vickery of Regent Street, and I was once more amazed, when I went there the other day to look for a wedding present, at the extraordinary variety of his inventions and designs. Walrus skin, which looks like a cross between crocodile and morocco, is one of the newest things, and makes the most charmingly soft and pliable cigar and cigarette cases, as well as blotters and card cases of all kinds. A most admirable invention, which should be particularly appreciated at present, when every day brings its account of robberies of

THE

GOLDSMITHS & SILVERSMITHS COMPANY, LTD.

With which is incorporated THE GOLDSMITHS' ALLIANCE (A. B. Savory & Sons), late of Cornhill, E.C.

BY APPOINTMENT TO H.M. THE KING.

112 & 110, REGENT STREET, LONDON, W.

jewels, is Mr. Vickery's new patent alarm for jewel and dressing bags, despatch boxes, document cases, and jewel boxes. The combined purses and card cases, which draw together with chains ending in either a watch or a little puff box, which serve to hold the chain between the fingers, greatly charmed me; but I found the present I required in one of Mr. Vickery's registered gardening baskets, lined with moss green leather and containing every possible thing that the heart of the amateur gardener could require, as well as space for flowers. Other delightful things were the locked letter trays and blotter, the delicate ladies' canes with handles that contained all manner of useful surprises, and the admirably practical telegraph forms, which can be sealed down and sent safe from domestic inspection and comment. In fact, the only drawback to a visit to Mr. Vickery's is the difficulty of coming to a decision among such innumerable articles, all of which one desires to buy for one's self.

A material which is being cultivated by the big dressmakers in Paris is tussore silk in all kinds of delicate colours. I saw a charming dress at Doucet's in prawn pink tussore, made with a corselet cut with a long panel that made the front of the skirt; the corselet fitted closely over the hips a little below the waist, the skirt being set into it in broad, full pleats, which were barred by transverse pleats set at irregular intervals, making a kind of uneven Greek pattern round the skirt. Above the corselet the bodice was fully bloused; and the effect of this fulness above the close-fitting corselet, and the lengthening of line owing to the front panel, were exceedingly becoming to a good figure. Tussore is an excellent material for summer wear, being cool to wear and pleasant to the touch, as well as most durable; and now that its natural khaki colour (the most unbecoming tint that ever was imagined for the destruction of human complexions!) can be mitigated by dyeing, it is a material that should not be ignored. The mania for broderie Anglaise has invaded it also; and a pale blue tussore silk embroidered in this fashion, and trimmed with frills of Valenciennes, is an enviable possession.

Those who do not mind wandering a little far afield will find a very charming and interesting little exhibition at the beautiful old hall of Clifford's Inn, Fleet Street, E.C. This historic old building makes an admirable setting for the present exhibition of the Junior Art-workers' Guild, which contains much excellent work in many branches. Mr. Ambrose Heal sends a very quaint and picturesque four-post bedstead in chestnut, and a chest of drawers in Colonial mahogany, which has the immense and decorative advantage of being on legs. Mr. Harry Napper's wall papers and hangings are admirable in colour and design, especially in the printed velveteens, which are most harmonious and decorative; and among other work calling for praise are Mr. Christopher Dean's bookbindings; Mr. Ware's silver jewellery and metal-work; Mr. Edward Spencer's little pots in Martin ware and copper; Mr. A. J. Penty's chest of drawers; Mr. Alfred Dennis's cretonnes and wall-papers; Mr. Frank Carter's pencil and pastel drawings; and Mr. Luke Taylor's delicate etchings. LAMIA.

FOUR-POSTER IN CHESTNUT.

A FORTNIGHT'S TIGER-SHOOTING.

GENERALLY speaking the tiger (Felis tigris) is now as much preserved in India as the red deer is in Scotland. The Maharajah, or Nizam, who is still lucky enough to have tigers in his dominions knows full well how keen any visitor is to kill one, and to this end is zealous in their protection. It therefore follows that unless you can get an invitation to the preserve of one of these potentates, you are not likely to get a shot at a tiger while in India. It so happened that in March, 1905, my friend C. and myself were lucky enough to be given a beat in Hyderabad (Deccan). The word "beat" is, perhaps, misleading, when the district in which we were allowed to shoot was something between 1,000 and 2,000 square miles in area. Being the guests of the Nizam, we found all arrangements made in that luxurious style so peculiar to the Oriental. Our camp was pitched some fourteen miles from the railway station. Here we found a large bell-tent each, a tent for messing in, numerous servants, cooks (khansamah), waiters (khitmagar), and coolies to clean up the camp, besides a police guard, and a guard of honour provided by the local cavalry, to turn out and present arms whenever any of us showed our noses. Our party consisted of C., his wife, Miss C., Major C., and myself, so that our camp was of some size, and our retinue proportionately large. The heat was very great, but our camp being pitched beneath some tamarind trees, we were always able to find some shade; and with every imaginable kind of drink, and a daily supply of ice, we grew to enjoy rather than to dislike it. In these parts, the usual method employed to locate tigers is to tie up young bulls overnight in the jungle; and they are visited next morning by one of the local shikaris (hunters), who, if he finds a beast killed, reports at once to headquarters. Oxen being sacred, the natives are not allowed to kill them or eat their meat; so that the bulls, being superabundant, can be bought very cheaply for tying up, and their destruction by tigers does not outrage religious feelings. And, strange though this may seem to the student of moral codes, it is certainly advantageous to the pocket of the would-be tiger-slayer, who often can obtain all the bulls he wants for one rupee (1s. 4d.) apiece. The bulls are tied up in the jungle at various points. Should the tiger visit any one beast, it will probably be in the very early hours of the morning. Having killed it (usually by springing on the throat), the tiger will drag away the carcase to some thicker part of the jungle, where it will partially devour it, and, having eaten what it wants, lie down near it and sleep, as it were with one eye open, lest any other beast should wish to snatch a meal. The foregoing is what a properly-behaved tiger should do. About seven in the morning the local shikari comes along, and sees that a particular bull has been killed and dragged away. He notes in which direction the carcase has been dragged, and studies life in the jungle near, to see what he can learn. The vultures, if the jungle is not too thick, will have seen the prospect of a meal, and will now be sitting in the trees over the remains if the tiger is still by, for they will not venture near till they can get undisputed possession. The monkeys, too, will show signs of uneasiness, and keep chattering in the trees, and the birds will also testify to the tiger's presence by anxious twitterings, just as

HEAD-SHIKARI.

BARNET ORTHO PLATES & BIRD PHOTOGRAPHY

Gannets on Nest with Young. Chas. Kirk, Photo.

Copy.

156, Sauchiehall Street, Glasgow,
May 9th, 1905.

Messrs. ELLIOTT & SONS, Ltd., Barnet.

Gentlemen,—With reference to my book of bird photographs, I have great satisfaction in stating that most of the negatives were made on Barnet plates, and since the introduction of the "Barnet Orthochromatic Plate" a new power has been placed in the hands of those who specialize in the photography of living wild birds. I have always found these plates of sufficient rapidity—even for focal plane work—giving good rendering of colour values without the use of a screen and in every way to be highly commended to the naturalist photographer.

Yours truly, (Signed) CHARLES KIRK.

(Within two minutes of the Wallace Collection).

in Great Britain they proclaim the whereabouts of a marauding cat. But should no such evidences of the tiger's retreat be forthcoming, the shikari will make a detour and, going round in a circle, carefully scan the ground for any footprints. If none is visible, he is almost safe in assuming that the tiger is within the prescribed area. He then comes at his best pace to the camp to report to the head-shikari that there has been a "kill," and the head-shikari informs the Sahibs, gets together the natives necessary for the drive, and makes all bunderbust (preparations). To us from Great Britain the number of natives seemed enormous, and on several occasions upwards of two hundred

BEATERS.

were employed. Their remuneration is, however, very small, two annas (twopence) being the daily wage, with, usually, double pay should a tiger be killed. They always seemed quite contented, and trudged along through the jungle with nothing on but a loin cloth, even in the heat of the day. They took no food, but nearly all of them carried hollowed-out gourds, in which they kept a supply of water. On our third day in camp, March 15th, the head-shikari reported to us at 11.30 that there had been a kill ten miles off. Judging from the pugs, or footprints, he reckoned that there were two cubs and a tigress, the pug of the tiger being rather square, while the female's is more oval. We were all keen to be off, and shortly after noon we started, C., Lady C., and Major C. riding, Miss C. and myself driving in a tonga, a rather superior farm-cart tented over and innocent of springs. After a six-mile drive we come up with the riders; the track we had been driving on ceased, and we had to get out. Ungallantly leaving Miss C. behind with the tonga, I proceeded to follow the others on foot. The heat being very great, they were soon out of sight; but I kept plodding along the track in the jungle, led by a native who knew the way. After an hour's half-walking, half-running, lest I should be late for the beat, I came upon my party dismounted below a shady tree; their patience was almost exhausted, and they were on the point of having the drive without me. We walked for about a mile along an ill-defined track through thickish jungle, with no particularly tall trees, the general appearance being something like a hazel copse in winter. The grass and vegetation were all dead and burnt up, and the whole ground covered with dead leaves, on which it was impossible to walk noiselessly. Arrived at a spot where the jungle is rather clearer, we were shown our machans, or seats tied up at a safe height in the trees. In this case, charpoys, or native beds, on which we sat cross-legged, or wicker stools, had been securely lashed by all four corners in trees about 30ft. high, and about 50yds. one from the other. I had drawn the lucky number—1; next me, to my left, was Lady C., then Major C., then C. Long bamboo ladders had been brought, and with the help of these we climbed up into our machans. Mine was tied about 20ft. from the ground, where, with the slightest breeze and my additional weight, it swayed most alarmingly. Having climbed into our places, the various coolies who had been carrying our rifles and other impedimenta took up positions in trees in front of the two outside greens, acting much as flankers do in a grouse-drive, and forming, as it were, a funnel into which the tigress should be driven. The heat, beating down through the bare branches of the trees, was terrific. About 20yds. to my right ran a nullah, or dried water-course, beyond which was thick jungle. In front of me was the little narrow pathway we had walked down, with fairly thick jungle beyond, and on my left was fairly open ground. The first excitement was caused by a mob of monkeys, which came from behind, leaping and bounding over trees and through bushes at the most astonishing speed. All around one could hear doves and pigeons cooing; otherwise the jungle seemed peacefully tranquil. All of a sudden, when it was nearly five o'clock, we heard, about half a mile in front of us, the signal-shot fired for the beat to begin. Instantly there was an uproar. Every beater shouted, and many of them had gongs, antiquated firearms (some of them 7ft. long), or large rattles. These they beat, fired, or whirled with a will, which made the jungle a perfect pandemonium. Excitement ran high, and every ear was strained to catch the first snapping of a twig or to hear the footfall of the tiger or the crackling leaves. One of the coolies, flanking in a tree on my right, suddenly caught my eye. He was clapping his hands gently, and throwing pieces of stick into the undergrowth below him. As he pointed, I could hear a rustling, and almost directly after came a double roar. The noise in the distance grew closer and louder, and in a few seconds there emerged, on to the path we had come

A MACHAN.

down, a tigress. For a moment she stood about 100yds. off, looking back towards the beat, lashing her tail, and then proceeded to walk down the path towards me, quite slowly and very quietly. She was hid from me by a thick lot of jungle; but turning to my right she left the path, to go between me and the nullah. When she was broadside to me between two thick bushes I fired with my ·450. So far as I could see she did not flinch, and I snapped at her again as she passed behind the second bush. I thought she staggered as I last caught sight of her, and a few seconds later I felt sure I heard a tell-tale gurgling in her throat. The beat went on, and first one and then the

(Continued on page xliv.)

An Important New Building.

THE tendency of great commercial firms to keep abreast of the times by erecting handsome and appropriate premises is shown in a significant manner in the very handsome building which Waring & Gillow are now bringing to a completion in Oxford Street. In many respects it is architecturally superior to the great majority of business houses, and it will be universally admitted that, besides being imposing in itself, it is a decided ornament to the West End of London. The design, which is partly founded on the main façade of Hampton Court Palace, is of exceptional beauty, and is carried out with such a careful balancing of parts that it is impossible to resist its convincing effect of harmony and proportion. Carved granite and freestone play an important part in the ornamentation, and this, although rich, is never allowed to lapse into redundancy. The building affords another example of the artistic enterprise of this progressive firm, and is a splendid illustration of the part which commercial houses may play in the improvement of great cities.

The interior of Waring & Gillow's new building, which is of great extent, will be commensurate in importance with its architectural pre-eminence. A few facts will convey some idea of the magnitude of the building. The façade is 140 feet high from the foundations to the top. There are over 100 galleries, averaging 60 feet by 30 feet, for which a thousand steel fireproof doors are necessary. There is a rotunda in the centre of the building which is half the diameter of the dome of St. Paul's Cathedral. There are 800 windows, 10,000 incandescent lamps, 18 elevators, and, in order to see every department, the visitor will have to make a tour of two miles and a quarter.

Messrs. Waring & Gillow have justly achieved a reputation for artistic excellence combined with inexpensiveness, and this reputation will be fully maintained, if not bettered, in their new abode. Buyers of furniture and household effects are not the only persons who will be catered for. If any one wants a house—large or small—built to suit his own requirements or fancy, Waring & Gillow, in conjunction with the Waring-White Building Company, will be quite prepared, under the direction of their clients' architects, to undertake it; so that in effect a man may have his house built, lighted, drained, decorated, furnished and equipped under the auspices of one firm.

It is intended to make the interior accommodation and conveniences for customers at least equal for comprehensiveness of scope, practical value and most up-to-date novelty, to the impressive grandeur of the exterior, in which one finds enormous size controlled by just proportions, wealth of decoration regulated by perfect taste, and architectural grace and beauty harnessed to the ministering resources of an everyday utility.

WARING & GILLOW'S NEW PREMISES, OXFORD STREET. *Architect: R. FRANK ATKINSON.*

other of her two little cubs trotted past me, going in just the same direction as their mother. They were beautiful little creatures, not much bigger than a retriever dog, and brilliantly striped with orange and black. When the coolies or beaters were within 150yds. of us they were halted, while the head-shikari called out to know what had happened. It is, as a general rule, understood that the tiger is not shot at in front; if it is, and is wounded, it may break back and maul one of the defenceless natives; similarly, if the tiger has been hit, and is lying near one's machan, it might, if the beaters came too near, suddenly revive and do serious damage. However, in this case, I was able to shout out that at any rate the tigress was a safe distance behind me, and I hoped and thought that she was dead. The beaters then came on, and we all climbed down from our machans, and examined the ground where I had fired. Not a trace of blood could be found, and I began to fear I had missed badly. It is on these occasions that accidents happen. The jungle is too thick to see far ahead, and before you know what to do you have almost trodden on the wounded tiger, who promptly dashes straight at you, and is on you almost before you can get your rifle to your shoulder. It is an invariable rule that several persons should go, all keeping close together, to look for a wounded tiger, the idea being that, should the tiger be come upon unawares, and should he charge, the effect of the combined shots, the multiplied noise and smoke may turn him off; but it is a position none of us wishes to be in. Having found no traces of hair or blood, we formed a little party and went very cautiously into the jungle, coolies being sent up repeatedly into trees to spy. Suddenly one of these called out that he saw the tigress lying dead, and we all ran forward to find her, shot through the lungs. From the position where the bullet had entered we saw that it was my first shot that had taken effect; but she had gone quite 100yds. before succumbing to it. She measured 8ft. 5½in. from the tip of her nose along her spine to the tip of her tail, and I was a proud man at the moment of our discovery. Leaving the natives to bring her in, we made our way back to camp. We heard of no more tigers in the vicinity, so moved to another camp on March 17th, where we found the same luxury as in Camp No. 1. On March 18th kubba (news) was brought in of a tiger twelve miles off. A drive being thought impossible, Major C. and C. rode off about 4 p.m. to sit up in a machan over a tied-up bull. This form of sport is rarely successful. The tiger is not likely to come till the early hours of the morning; he comes very cautiously and nervously, and the least sound or movement will scare him away. His sense of smell, too, is very acute, and he will not come near the bull if he scents danger. Moreover, shooting by moonlight is in itself uncertain. In confirmation of these facts, our sportsmen returned next morning empty-handed. They had heard the "wouf, wouf" of a tiger, but it had probably got wind of them, and they never saw it. We had now to possess our souls in patience, and content ourselves with pottering near the camp after peafowl and jungle-fowl (both excellent eating) till March 20th, when news was brought in of another tigress and four cubs only five miles off. This time we all rode off, and got to our machans by two o'clock. The jungle here was thicker, and strewn with rocks and boulders. Our positions commanded a valley flanked on either side by rocky hills. Before the drive began two nilgai trotted through the line, but were not shot at for fear of disturbing the tigress. The firing, rattling, and shouting of the natives commenced about 2.30, and immediately a large mob of monkeys came bounding along. There were also numbers of birds, and amongst the many brilliant plumages we noticed particularly some beautiful little woodpeckers. About three o'clock I heard a shot fired to my right, and looking in that direction saw that the tigress had been shot at by C., and was now charging full tilt past the machan next to mine. Lady C., who was its occupant, had a most difficult shot, as it passed right below her and came galloping towards me. Roaring, it leapt a nullah between us, giving me two crossing shots at about 25yds. I missed, and it bounded out of sight. The drive went on, and I had a glimpse of the cubs as they broke out in front of me to my left. The return to our camp empty-handed was disconsolate, and we had no news of a kill till March 23rd. That morning news was brought in that this same tigress had killed in nearly the same place. We were off by noon, and the strip of jungle was driven the reverse way. I was on the right, Lady C. in the centre, C. on the left. Our positions again commanded the valley between the two rocky hills, one of which was some 400yds. in front of me; the jungle was thick on my left, but there was a kind of track leading to the tree in which my machan was tied. Flankers were posted in trees to my right, as far as I could see, to the top of the hill. After a wait of nearly two hours the first shot was fired by the beaters. Almost instantaneously there was a reverberating roar, and I heard and saw the flankers in the trees shrieking and gesticulating wildly. Away on the hillside I could see the enraged tigress charging straight down at us. Snatching up my ·450, as she appeared at 20yds., galloping straight for my tree, I fired and missed; she looked up, roared, and dashed on. Just as she was right below my machan, I fired again, and, shot through the neck, she slid along the ground, and rolled over dead. The cubs shortly after crossed to my left, and C. got a right and left. The drivers coming up, we found that both the cubs were a good size, and my tigress quite a fine one, measuring 8ft. 9in. Hitherto having had all the luck, I made up my mind not to go out again; so that, on March 27th, when news came in of a tiger having killed seven miles off, Lady C. and C. went out alone. In the evening I walked out to meet them, and was delighted to hear that C. bowled the tiger over as he trotted past him at about 50yds. He was a fine fellow, 9ft. 8in. in length, and was known to the locality as the Burra Chaw (big thief). Having stolen many of their cattle, the natives were particularly pleased at his death. That evening when at dinner we heard a tremendous shouting and beating of gongs, and on going out found that the tiger was being carried in. Natives walked in front waving branches and carrying torches; and behind these the tiger was borne on a litter covered over with greenery by some dozen natives, while in the rear followed the yelling horde of villagers. Having given, under the guidance of the head-shikari, a very creditable rendering of three cheers for C., they were prevailed upon to disperse, and the camp was once more quiet. This was our last day's sport, as we had to start next day to catch the boat leaving Bombay on April 1st. We were more than satisfied with our fortnight's sport, especially as our trophies were extraordinarily good specimens. In these parts a tiger measures from 9ft. to 9ft. 10in., and not one in fifty will be over 10ft. The tigress measures from 8ft. 3in. to 8ft. 9in., and is very rarely over 9ft. When properly stretched and dried the skin measures some 2ft. more, which fact often accounts for the stories of absurdly large tigers. The shoulder height in a male is from 40in. to 42in., and in a female 35in. to 37in. Their weight is hard to estimate, but 450lb. to 540lb. for a tiger and 340lb. to 400lb. for a tigress would probably be found to be about correct. The older they are the less brilliantly are they marked, the younger ones being more vivid in colour, with their stripes darker and closer together. We were wise to have our skins carefully watched, as the natives in some parts singe the whiskers of a dead tiger as a mark of disrespect, and in others collect them, supposing them to possess magical charms. They are apt also to filch the claws, and you must remember, if you want them for brooches, to demand the two rudimentary clavicle bones, embedded in the flesh near the shoulder, which otherwise the natives take, as they consider their possession lucky. As it was, we got all the trophies we wanted, and only the carcase went to the coolies, who, as is the custom in these parts, ate it. The skulls were boiled to remove all the flesh, and the skins were roughly cured with wood ashes, in which condition they travelled quite safely to London. Here, they were handed over to be properly set up and mounted, to serve as reminders (if a reminder will ever be necessary) of our fortnight's tiger-shooting.

LITERARY NOTES.

MR. WILFRID WILSON GIBSON is one of the most promising of our younger poets, and it is always a pleasure to see another of those little paper-bound volumes in which his verses appear. The latest of them, *The Nets of Love* (Elkin Mathews) will bear favourable comparison with its predecessors. Mr. Gibson belongs to the romantic style of poet, and perhaps if any fault can be found with him it is one small touch of what in golf they call "over pressing." He is best when he is homeliest, as in the fine verses "In the Byres," of which the first runs as follows:

"The warm milk swishes in the pail;
The kine's warm breathing fills the byre;
My brow, against the hot flanks pressed,
Throbs, aching, as, with hands that tire,
I ease the straining teats, nor rest
Until the teeming udders fail."

And here is a picture of the hayfield that it would be very difficult to surpass:

"I watched the martin wheel and poise
Above his nested mate,
When, clear through morning's murmurous noise
I heard a clicking gate,
As, down the dipping meadow-road,
He bore, with easy pace,
His shouldered scythe; and brightly glowed
The dawnlight on his face.
All morn, with swinging chorus blithe,
Unwearied, through cool hours,
Was heard the swishing of the scythe
Among the grass and flowers.
All morn, behind the swaying row
Of shoulders brown and bare,
I followed, glad at heart to know
He moved before me there.
And, as I laboured with the rake
Among the stricken grass,
Light-footed in the mowers' wake,
The happy hours did pass.
Too swift they fled; and all too soon
The hour of resting came,
When o'er the withering field the noon
Hung like an azure flame."

In some of the other poems it seems to us that the expression used by Mr. Gibson is somewhat too strong for the amount of thought and inspiration behind it.

Why Mr. Leicester Romayne should have called his verses *Tea-Table Rhymes and Others* (Brimley Johnson) one does not quite know. Many of them, however, are pretty and all are readable. We quote the following not because it is the best or the worst, but for its brevity, and because it gives a fair idea of the poet's quality:

"POETRY IN THE PAN.

'Great Alfred dead, and Browning gone away!'
Thus mournful spoke young Laurence on a day.
'What bards have we, in this degenerate time?
Poor stragglers they who now Parnassus climb!'
'You do not search aright,' I answer made;
'Look not in broadcloth, but in homelier plaid.
Our Pope in days gone by did foolish sing,
"A little learning is a dangerous thing."
Mistaken bard! our sapient school boards grow
Poets in Putney, wits in Ham and Bow.
In pantry seek the muse—nay, out upon it—
You serve the meal, while cook hits off a sonnet!'"

In the third part of the *Empire's Cricketers*, the pictures, which are even better than those in the preceding number, show us Mr. J. Darling stepping out to drive, Lord Harris playing a break-back on a slow wicket, Mr. Reginald H. Spooner finishing an off-drive along the ground, and Mr. Schofield Haigh about to deliver. It was a good idea to give us some of the earlier cricketers, such as Lord Harris. Memory is so short that a great many people, no doubt, have forgotten that Lord Harris took an English team out to Australia in 1879, and has represented England in four test matches. Mr. R. H. Spooner is another cricketer whose name is not quite so familiar as it ought to be, although he is the opposite of Lord Harris, in this way, that he has only recently come to the front. He played for his county while still at Marlborough in 1899, and last year he took a great part in securing the championship for Lancashire, securing five centuries and having an average of forty-eight. He is a very promising bat, who one day will probably be chosen as a representative of England. The portrait of Haigh is an exceptionally good one, so full of life and action that it might really have been the result of an instantaneous photograph.

The latest edition of the beautiful series of books illustrated in colours issued by A. and C. Black is *Beautiful Wales*, painted by Robert Fowler and described by Edward Thomas, a young journalist who is rapidly winning distinction for himself in London. He knows his Wales thoroughly, and writes upon it with heart as well as information; the result is a very charming book, of which we do not know whether we admire more the letterpress or the pictures.

In Drane's A B C Series, it was a capital idea to publish the beginning of Staunton's *Chess*. Since it was written Staunton's hand-book has been the best manual of the game existing in the English or perhaps any other language, and as far as the principles of the play are concerned it has not been, and cannot be, bettered. But analyses has discovered that many of his methods of attacking and opening, though effective at the time when he wrote, have now grown obsolete, and hence the hand-book has gone out of favour with chess-players, but all that is contained in the tiny volume is excellent, and it was a good idea to supplement what Staunton had to say with examples of very modern games such as those played between Marco and Janowski, Pillsbury and Lasker, and Charousek and Showalter. The little volume may be cordially recommended to those who wish to learn the most beautiful and fascinating of all our indoor games.

A pretty little edition of the poems of Gray and Collins has just been published by Messrs. George Newnes, Limited, which will inevitably lead to a good deal of comment on the poet who wrote the "Elegy in the Country Churchyard," as one or two modern critics, following the example of Dr. Johnson, have tried to depreciate the value of this poem in the public estimation. We do not think they will be successful, because, in spite of all that has been said about the commonness of the metaphors and sentiments, they are such a fine and accurate interpretation of the human mood that they are likely to please our successors as much as they have pleased ourselves. It is apt to be forgotten that Gray wrote many beautiful verses in addition to this most celebrated achievement. His "Ode on the Death of a Favourite Cat" has a charm and elegance all its own, and such a good judge of poetry as the late Mr. W. E. Henley included in his "Lyra Heroica" the well-known "Bard" beginning:

"Ruin seize thee, ruthless King!
Confusion on thy banners wait;
Though fanned by Conquest's crimson wing,
They mock the air with idle state."

Collins is less known than Gray, but several of his pieces used to be included in the school-books, and well deserve that honour. What could be finer than the following:

"How sleep the brave, who sink to rest,
By all their country's wishes blest!
When Spring, with dewy fingers cold,
Returns to deck their hallowed mould,
She there shall dress a sweeter sod
Than Fancy's feet have ever trod.
By fairy hands their knell is rung;
By forms unseen their dirge is sung;
There Honour comes, a pilgrim gray,
To bless the turf that wraps their clay;
And Freedom shall a while repair
To dwell a weeping hermit there!"

A very instructive and in a way entertaining book, although in places full of technicalities, is *Experiments with Plants* (Macmillan) by Dr. Osterhout, assistant professor of botany in the University of California. It reveals a deep insight into the ways of plants, but is more a book for the serious student than the casual observer. The author should in all future editions eliminate the "etc." which is generally an irritating term and often meaningless. It occurs frequently in this volume, and only leaves the reader in doubt as to the plants the author wishes to indicate. The following quotation will show that the information is conveyed in a clear and practical way: "Everyone is more or less familiar with the effects of wind on plants. Near the sea-coast, or on mountains, or wherever trees are exposed daily to strong wind, they show by their bent forms and curious shapes its potent influence. The dying of the branches on the windward side is due to the drying effect of the wind, which may increase transpiration as much as twentyfold. Even moist winds may have a drying effect. It is interesting to observe how the one-sided development of leaves and branches affects the stem. It may be observed in vines and other plants which climb on walls."

A practical little gardening book is *How to Make and Manage a Garden* (C. Arthur Pearson), which is useful to the beginner, and the amateur who has advanced a few steps in practical horticulture. The advice is sound and well expressed. Mr. Rowles, the author, has certainly written an excellent little book. It is freely illustrated with explanatory diagrams.

THE newest delicacy for lovers of good things. Light wafer biscuits of most refined flavour. Delightful with ices, sweets, or fruits. But a perfect dessert by themselves.

Elegant. Dainty. Pleasantly sweet. A triumph in fine biscuit making.

THE AUTOMOBILE WORLD.

THE recent rains, so thankfully welcomed by agriculturists throughout the kingdom, have also brought a temporary relief from a nuisance which affects an even wider class of the population. One has heard of late a great deal about the reckless and inconsiderate behaviour of a certain class of motorists, but it is extremely doubtful whether public feeling would have risen to such a height in the country districts, were it not that the automobile has once more roused into activity the dust demon which had lain more or less quiescent on our deserted roads since the disappearance of the fast stage-coach. Dust is the greatest enemy which the motorist who has the well-being of the movement at heart has to fight, for where one person may be endangered by a reckless driver, a hundred are inconvenienced and incensed by the dust that even the most careful and considerate of motorists cannot help raising at times. There are thousands of people who will watch a swiftly-moving car with interest and even admiration when the roads are moist and dustless, but whose feelings not unnaturally undergo a marked change when the same car carries in its wake a choking white cloud which settles thickly on everything within a radius of 20yds. or 30yds. The "motor question" is really the "dust question," for it is inconceivable that the police, with the very wide powers granted to them under the present Act, and supported by magistrates as a whole not too well disposed towards the motorist, are incapable of dealing with reckless driving or excessive speed.

Experts are agreed that nothing short of remaking the roads with dustless materials can effect a radical cure of the evil, and several of the more energetic and progressive road surveyors are experimenting in this direction. The results go far towards proving that although the cost of road-making would be somewhat higher than at present, the increase in durability and the saving in the cost of repairs and general up-keep would more than compensate for the initial outlay. Much light on the subject was recently thrown by an interesting report prepared by the district surveyor of Godstone, who based his conclusions on an inspection of stretches of road laid with tar-macadam in various parts of the country. His figures are largely estimates, but coming from a practical man are worthy of serious attention. According to his calculations the employment of tar-macadam, including the tarring of the scarified foundation, adds about 4s. per ton to the present cost of road metal. This figure, it may be noted, is considerably higher than the estimates of other surveyors who have enquired into the matter, and it would doubtless be found to vary in different localities. A saving, amounting to about 65 per cent., would, on the other hand, be effected in the cost of rolling and consolidation; but it is in the cost of up-keep and in the increased durability of the road surface that the greatest economies would undoubtedly be experienced. The Godstone surveyor states from actual knowledge and personal observation that roads made with tar-macadam are found in good order after seven or eight years, instead of requiring repairs every three years. The cost of the ordinary manual labour required to keep the surface in good condition shows an equally satisfactory reduction, and, generally, the arguments in favour of the general use of the dustless tar-macadam are put forward in a very convincing manner. With such a promising solution of a very serious problem in sight it is to be hoped that local authorities will realise the necessity of carrying out experiments on a sufficiently extensive scale to prove conclusively the merits of this or any other dustless road material which may offer a reasonable chance of success. No sane person doubts that self-propelled vehicles of all kinds will rapidly increase in numbers, and that the dust question will become more and more acute as years go by unless some serious attempt is made to grapple with the difficulty.

In the meantime much can be done to lessen the nuisance by the use of tar and other dust-laying substances on those portions of the main roads which run through villages and past private residences. It is absurd for rich owners to complain loudly of the depreciation of their property when for a few pounds per annum they can adequately protect their frontages from dust. The use of tar for this purpose has passed beyond the experimental stage, and many of the district councils round London have learnt how to apply it to the road surface so as to obtain the best results and cause the least possible interference with the traffic. To take one instance, the Epsom Council has recently tarred several stretches of road at the cost of private owners, and the results have proved satisfactory in every way. The process is extremely simple, and experience gained during the summer of last year has enabled the road foremen largely to overcome any objections, such as stickiness in hot weather, which previously existed. The surface is first thoroughly scraped and brushed, so as to expose the bare metal, and the grit and small stones are collected by the roadside. The tar is then heated and poured over the surface, and evenly distributed by means of hard brushes. The scrapings are then scattered over the road again, and combine with the tar to form a hard, smooth, water-tight crust, which for a year, or even more, will be practically dustless. Half the road is treated at a time, and it is generally found that the tarred portion can be thrown open to traffic within a few hours after the work is completed. The cost is by no means excessive, considering the advantages obtained; and it is difficult to understand why every village on a main road near London does not abandon watering in favour of the tar process. For a private owner the cost works out at about £5 per 100yds. of road of average width; but this figure could doubtless be reduced where the work was carried out on a large scale. Speaking from personal experience, we can testify to the efficacy of the tarring process, and recommend it to those who, living near a motor-frequented highway, suffer from the dust nuisance.

MOTORING IN ITALY.
A White steam car near the Arch of Titus.

THE FRENCH ELIMINATING TRIALS.

IN many respects the French Eliminating Trials, which are held to-day (Friday), may be regarded as the most interesting motor event of the year, as they will decide the much-debated question of the suitability of the Auvergne Circuit for high-speed motor-racing. It is, therefore, of interest to recall a few of the leading features of the course, which, with the aid of the map on another page, will help to explain and render intelligible the telegrams from

A REMARKABLE HILL-CLIMBING TEST.

The following extract from "The Bristol Daily Mercury," of March 20, shows what a

Four-Cylinder Humber

WILL DO.

"The hill-climbing capabilities of a Humber 16-20 h.p. motor car were satisfactorily tested on Saturday morning, when it ascended from Stokes Crott up precipitous Thomas Street to Freemantle Square, to the surprise and admiration of a number of spectators who happened to be in the locality just before noon. This is how the ascent was made. The car, having been brought to a standing position at the bottom of Thomas Street, was set in motion, and at a rate of about twelve miles an hour reached the point where the even gradient of the hill is abruptly broken by a short and steep incline, that is, about half-way up. Here a stoppage was made, and then the car resumed its course, accomplishing the most difficult part of the run at about ten or twelve miles an hour. There must be a deal of reserved power in a car that can be re-started from such a position. Its four occupants kept their seats throughout the journey. The Humber runs very quietly and smoothly, and the 'flexibility' of the engines is a great advantage The car has climbed several noted hills, including Dundry Hill, Blue Bowl Hill (Wells), East Harptree Hill, Blagdon Hill, and the Cheddar Gorge. It was brought to Bristol to be tested in steep Thomas Street, the gradient of which shows an average of one in four."

The 16-20 h.p. four-cylinder Beeston Humber Car made a non-stop record throughout the Scottish Reliability Trial. See reports for complete details of its splendid performance.

the scene of the contest, which will appear in the evening papers within a few hours of the time that these lines appear in print. For much of the information we are indebted to an excellent map of the course which has been issued by the great French firm of tyre-makers, Messrs. Michelin and Co., whose works at Clermont Ferrand are only a few kilomètres from the south-eastern corner of the circuit.

The start and finish of the race will take place on the plains of Laschamp, where the French Club has erected its grand stand. The

THE ROUTE FOR THE GORDON BENNETT RACE.

course is 137 kil. 444 in circumference, and has to be covered four times, making the total distance 550 kil. (or 341¾ miles). Rising with a steep gradient of about 10 per cent., the road soon arrives at the highest point of the circuit, about 1,065 mètres above sea-level, which is followed by a descent to the Nébouzat cross-roads. Thence to the outskirts of Rochefort (21 kil. 300 from the start) the course is fairly wide and free from dangers. Rochefort contains two dangerous turnings, and has been made a control, the cars being piloted through the town at a slow pace. After negotiating an exceedingly awkward corner about a kilomètre from Rochefort, the course is fairly good to Laqueuille (30 kilomètres), the second control. Here the cars will be stopped, and started at intervals of 3min. each. Beyond the village there is a dangerous turning flanked by a precipice, but thence, to the outskirts of Bourg-Lastic, the road is wide and fairly straight, and really high speed is possible for the first time since the start. The cars do not enter Bourg-Lastic, but turn northwards at one of the most acute-angled corners on the course, known as the Virage de la Vierge, towards Lastic (54 kilomètres), Herment (60 kil. 100), and Le Chambon (77 kil. 954). This is the most difficult portion of the circuit, the road presenting a constant succession of twists and turns, with numerous steep ascents and descents to aggravate the difficulties which beset the driver. From Le Chambon to La Goutelle (90 kil. 500) the road, though winding and undulating, is wide enough to render a good speed possible, but a few kilomètres beyond the last-named village there are three dangerous corners in quick succession, the first of which occurs at the bottom of a precipitous descent. At Pontgibaud (99 kil. 500) the cars will be stopped, and restarted in the same manner as at Laqueuille. Pontgibaud itself contains two dangerous points, one a right-angled turn over a narrow bridge, where the road narrows to about 18ft. in width. The town is left by a 12 per cent. ascent, but shortly after the village of St. Ours is left behind there is a good run to Le Cratère (112 kil. 800). Thence the road resumes its winding nature for the descent to the cross-roads near Clermont Ferrand. A few more difficulties in the shape of S turns and a 15 per cent. gradient, and La Baraque is reached, whence the harassed drivers will have a straight run back to the starting-point before they start the round of the course once more.

Much has been done to lessen the appalling dangers of the course by banking the corners, and erecting strong palisades to prevent the cars plunging over precipices. Moreover, three level crossings have actually been bridged to avoid any possibility of a collision with passing trains. The road surface, however, from all accounts, remains in a very bad state, and unfortunately it is worst in those rare portions of the course where a high rate of speed would otherwise be possible. It is possible that an effort may be made in the last few day sbefore the race to improve matters, and with this end in view the course has been closed entirely to racing cars for the last week or two. This prohibition gave rise to some apprehension in this country, as it was thought that the British team would thereby be prevented from carrying out their practice spins. The course will, however, be thrown open again after the French Trials. In any case, from the nature of the circuit, with its 145 dangerous turnings, its constant succession of steep ascents and descents, its poor surface and the numerous villages which line the route, the times recorded must necessarily be slow. Experts have estimated the probable speed of the winner at from 80 kilomètres to 85 kilomètres an hour, which is less than that accomplished by Théry on the Taunus course last year, but faster than the best time made in Ireland in 1903. An average speed of 80 kilomètres would make the duration of the race about seven hours, so that the results are hardly likely to be known in London till late this afternoon. We give below a table showing the starting order of the competing cars, their drivers, and a few of their constructional details:

Name of Maker.	*Order of Starting.*	*Names of Drivers.*	*Stroke & Bore in mm.*	*Horse-power.*	*Trans-mission.*	*Wheel-base.* ft.	*Wheel-base.* in.	*Track.* ft.	*Track.* in.

BRAKE DEMONSTRATIONS AT THE CRYSTAL PALACE.

As might have been expected, some very interesting results were forthcoming from a series of tests at the Crystal Palace on Wednesday between motor-cars and horse-drawn vehicles, the affair having been organised by Mr. S. F. Edge. Five different types of the latter were utilised, namely, a carrier's van drawn by two horses, a single-horse brougham, a hansom cab, a butcher's cart, and a pneumatic-tyred sulky. The last named was driven by Will Bishop, an expert from the Coliseum, with a very limber-looking animal between the shafts. The motor-vehicles employed comprised a 20 h.p. G.P.O. van, a 30 h.p. six-cylinder Napier, a 18 h.p. Mercédès, a 15 h.p. De Dion, a 15 h.p. Napier, and the racing Napier which Mr. Cecil Edge drove in the recent Eliminating Trials in the Isle of Man. Excellent arrangements had been made for obtaining accurate results, official timekeepers being present, together with an army of flag-holders and men to paint white lines across the upper terrace, on which the tests took place. It is conceivable that the partisans of the horse may possibly consider that as the affair was organised by automobilists it would not be fairly conducted; in which case it may be said at once that no fault could be found in any way with the arrangements, and certainly the conditions favoured the horse-drawn vehicles, inasmuch as heavy rain was falling, and the ground was far too soft for the tyres to obtain

their maximum of grip, whereas, on the other hand, it was just about right for the animals. The *modus operandi* was as follows: Twelve flag-bearers, each carrying two red flags, were stationed in pairs along the terrace. Before each trial one pair was instructed to give the signal to pull up, the pull-up, of course, taking place at a different place each time, so that none of the drivers knew where they would have to stop. All the flag-bearers held their arms and flags vertically, but the pair chosen to give the signal dropped their arms and flags suddenly to the horizontal. The drivers, therefore, proceeded past the flagmen until they arrived at the pair who dropped their flags. A broad white line was painted just beyond each pair of flagmen, and the aim of each driver was to bring his vehicle to a stop as near as possible to the line. Naturally in every case the motor-vehicle was faster than the horse-drawn type against which it ran; the horse-driver was, therefore, ordered to go as fast as he could, and the car driver had to keep on level terms. After each pull-up the distance was carefully measured from the fore feet of the horse to the white line, and from the front wheel of the car.

All the cars, it may be mentioned, were up-to-date patterns with long wheel-bases; in fact, in the case of the hansom, the butcher's cart, and the sulky, the total length of the horse-drawn vehicle would be shorter than that of the car. The speeds at which the respective vehicles were travelling were also carefully noted by the official timekeepers over a distance of one fiftieth of a mile. The motor-mail van made short work of the carrier's van, and then came tests against the brougham by the six-cylinder Napier. At the first attempt Macdonald, who drove the latter, had not properly realised the nature of the signal, and did not pull up until warned by his passengers. As a result, whereas the first time he took 26½ft. at ten miles an hour, the second time he pulled up in 10ft., when travelling at over thirteen. The brougham driver then warmed to his work, and got his horse to attain a speed of over 15½ miles an hour, which shows that town carriages move much faster than is popularly supposed. At this rate he pulled up in 42ft. 10in., whereas the car was pulled up in 18ft. It was the driver's first attempt, however, and he was by no means quick in applying his brakes. Still, the comparison was quite sufficiently in favour of the automobile. The hansom driver went so slowly that, though he could not pull up in less than 24½ft., the 15 h.p. De Dion pulled up in 1ft. 6in.! The butcher's cart, of course, was hopelessly out of it against two cars in succession. Very interesting, however, were the two matches between the racing Napier and the sulky. The driver of the latter was extremely clever, and, partly owing to the lightness and shortness of his vehicle, and his own favourable position for exerting a strong pull on the horse, he made a far better showing than any of the other horse-drawn vehicles proportionately to his speed. Even then, however, the motor-car was seen to materially better advantage. The general results showed that, roundly speaking, a horse-drawn vehicle requires three times as much space to pull up in as that in which an automobile can be stopped. The following table shows the results arrived at and the speeds at which the vehicles were travelling:

Vehicle.	*Stopped in Ft.*	*In.*	*Travelling at Miles per hour.*	*Stopped in Ft.*	*In.*	*Travelling at Miles per hour.*

THE AUTOMOBILE CLUB HILL-CLIMB AT SOUTH HARTING.

Except for a few brief moments of watery sunshine in the early part of the afternoon, the weather on Saturday last was most unfavourable for the Automobile Club, which was holding a hill-climbing competition for touring cars at South Harting. The scene of operations lies some five miles to the south-east of Petersfield, on the road from that place to Chichester. The dull and threatening outlook in the early morning, coupled with the remoteness of the locality, doubtless prevented a number of people who lived at a distance from putting in an appearance, so that until well on in the afternoon the attendance was very moderate in numbers. However, what it lacked in size it made up for in enthusiasm, and from an early hour there were little knots of interested spectators at all places where the gradient gave promise of affording excitement later in the day. The hill selected for the competition was just over a mile in length, the road winding up from the village of South Harting to the summit of the South Downs. The gradient is very severe, averaging for the entire course 1 in 12, with several exceptionally bad corners, where it is as high as 1 in 7, and 1 in 8½. It was naturally at these spots that the majority of the spectators assembled, with the intention of being "in at the death" in the event of any competitors coming to grief. However, considering how very stiff was the task set, both cars and drivers did remarkably well, the number of failures being extraordinarily low. The weighing-in of the cars took place at the Petersfield goods station at 10.30, nearly all the competitors, together with the club officials, having arrived at Petersfield overnight. The competition was run off in three classes, the cars being grouped according to price. Class A was for cars whose list price was from £150 to £350, and of these those priced at from £150 to £250 had to carry two "up," while those from £250 to £350 were laden with four passengers. Class B included all cars the chassis price of which was from £300 to £500. Class C was reserved for machines whose chassis cost from £500 to £850.

TYRE TROUBLES ?

IN THE SCOTTISH RELIABILITY TRIALS.

In the Scottish Reliability Trials **20 cars broke down** owing to pneumatic tyre troubles, losing **over 12 hours** in less than four days only for repairs in the hands of experts with assistants, yet this loss of time was counted as a **non-stop.**

Let us quote for converting your wheels to these large comfortable High-speed.

SIRDAR-BUFFER TYRES

The "Motor News" says:—

"Nipped tubes are a constant source of trouble, especially to a beginner. The Sirdar air tube gets over this difficulty. It is vulcanised in a **U**-shape, so that when placed inside the cover it springs naturally into the crown of same, and so keeps clear of the edges of the cover, or the tools used for fitting purposes. It is essential however, that it should not be partially inflated when the cover is being replaced. These tubes are made, if anything, larger than the inside of the cover, and when inflated are compressed both laterally and longitudinally, instead of being stretched as the ordinary air tube is. They consequently afford great resistance to puncturing material."

Thousands of delighted users can be referred to.

In Classes A and B there were two prizes—the first prize a cup, presented by Earl Russell, while the second car received the club's silver medal. In Class C the first prize was a cup given by the Sussex County Automobile Club, and the second the club's silver medal. Owing to there being as many as forty-nine entries, the weighing-in took longer than had been anticipated, with the result that the start, which had been officially timed to take place at noon, was delayed until 12.30. However, the competitors made good use of the interval. The majority, as they arrived from the weigh-bridge, came up to have a final inspection of the course. The conditions generally did not favour the accomplishment of any phenomenally fast times, for the lower part of the hill was in a nasty greasy state, while the difficulty of negotiating the steeper portions in the middle was accentuated by the surface being rather soft after the continuous rain. The onlookers received some idea of the difficulties to be encountered from the struggles of several cars which were trying prior to the start to take up positions for the day just above the steepest "pitch." Many had to shed passengers, and one or two were not above accepting a friendly shove. A local custodian of the peace stationed at the worst spot of all was heard mournfully to deplore the improbability of anyone infringing the speed limit within his personal jurisdiction. In a biting wind and drizzling rain the start was made with Class A. Mr. Arnott's 14 h.p. Minerva was first on the list, but, unfortunately, was prevented from taking part owing to a mishap to the inlet-valve gear. No. 2 was the 12—14 h.p. Leader driven by Mr. Malcolm McCraith, who brought her up in good style. In the absence of the 12 h.p. Darracq, 12 h.p. Whitlock Aster, and another 12 h.p. Leader, the second to come up was the 8—10 h.p. Coventry Humber, which did a splendid course, the first speed lever once being used, and the second only on the worst part, just in the middle of the hill. This car afterwards came up with six passengers, though only seated for two. No. 3 was Mr. Ashby's 14 h.p. Minerva, which did very well. No. 4, 8 h.p. James and Browne, found the steepest pitch trying, but got safely up. No. 5, 8 h.p Alldays, was slow but sure. No. 6, Colonel Wilson's 12 h.p. Leader, did a good course. No. 7, 10 h.p. De Dion, found the bad curve difficult, but picked up well. No. 8, Miss Dorothy Levitt (and her dog!) on an 8 h.p. De Dion, got up safely. No. 9, the 10—12 h.p. Peugeot, after sticking three times on the worst corner, got up safely. No. 10, the 10 h.p. Speedwell, made a very fine course, and was much admired.

AUTOMOBILE CLUB HILL-CLIMB.

Class B was sent off when competitors in Class A had returned to the bottom of the hill. The first to go off was the 12—16 h.p. Spyker, which got up safely, but lost time owing to a bad change of speed. No. 2, 15 h.p. Orleans, did a good but not very fast course. No 3, 13 h.p. Dixi, went up exceedingly well without a falter. No. 4, 15 h.p. Darracq, was excellent. No. 5, 20 h.p. M.M.C., went steadily, though not fast. Another 20 h.p. M.M.C. being absent, No. 6 was a 15 h.p. White steam car, whose back-seat passengers were sitting on the floor of the tonneau. No. 7, a 15 h.p. White steam car. Neither of the Whites was quite up to expectation, though they both went well. No. 8, 15 h.p. Whitlock Aster, was rather slow, but very steady. No. 9, 16—20 h.p. Beeston Humber, went up splendidly, travelling very fast on the steepest gradient. No. 10, 12 h.p. Sunbeam, was very slow, but the engine pulled well. No. 11,

BURBERRY-PROOFS

Keep out the wet and are free from condensing heat. They have been tested in every climate and temperature, and everywhere pronounced the best.

BURBERRYS Patent Pivot Sleeve Golfing Jackets (for men and women) give an amazing freedom of arm swing and improve play 25 per cent.

BURBERRYS Slip-on is light to carry, cool to wear, gives ample protection in wet, is a handy and durable spring overcoat and perfect raincoat in one.

Many new models in Travelling, Country, and Sporting Gowns and Headgear, and 1905 Novelties in materials, viz., Rainbow Cloths, Gamefeathers, Plus Beau, and Airylight Herringbones are now displayed in Burberrys Ladies' Department.

"The principle of the SLIP-ON is a fine freedom everywhere, which keeps him dry and unfettered during a hard day's work in the rain."
—*The Field.*

"I have had several of your Slip-on coats, and as a country doctor I have found them very successful in every respect, and since using them I have practically discarded all mackintoshes, and have recommended your coats to several of my friends and patients, and they all speak very well of them."

BURBERRYS, 30, 31, HAYMARKET.

20—22 h.p. Whitlock Aster, did excellently with five passengers. No. 12, 12—14 h.p. Climax, ran steadily and well. No. 13, 15 h.p. White steam car, was fairly fast. No. 14, 12 h.p. Mors, was very slow—perhaps Miss Levitt's dog is a heavy-weight. No. 15, 14 h.p. Hallamshire, stuck, and retired.

Class C afforded some fine sport, the Daimlers especially being much admired. No. 1, 18—24 h.p. B.A.C.S., went up nicely, but was missing a little. No. 2, 24 h.p. Thornycroft, driven by Mr. Tom Thornycroft, went well. No. 3, Mr. Gorham's 30 h.p. Daimler, was magnificent, and very fast. No. 4, 40 h.p. Berliet, went fast. This car is on Mércèdes lines, and has a great reputation as a hill-climber in France. No. 5, Mrs. Herbert Lloyd's 30 h.p. Daimler, was very fast. No. 6, 18 h.p. Peugeot, went well, but was slow after the Daimlers. No. 7, Mr. Instone's 30 h.p. Daimler, was excellent. No. 8: In the absence of the 24 h.p. Germain, owing to a broken piston, and the 20 h.p. Renault and 24 h.p. Mors not appearing, Mr. Manville's 30 h.p. Daimler was next up in fine style. The 30 h.p. Ariel was not forthcoming, so No. 9 was Mr. Baxendale's 24 h.p. Thornycroft, which, after negotiating the worst gradient, came to a halt and had to be helped to start again. No. 10, 24 h.p. Wolseley, was very slow, but had a waggonette body. No. 11, 16 h.p. Florentia, was not very fast, but pulled steadily. No. 12, 24 h.p. Rochet-Schneider, did well, in spite of missing fire a little. None of the times is published by the club, but the winners in the various classes were as follows:

Class A—First prize (cup presented by Earl Russell), Mr. F. W. Adams's 8—10 h.p. Coventry Humber; second prize (club silver medal), Mr. J. W. H. Dew's 10 h.p. Speedwell.

Class B—First prize (cup presented by Earl Russell), Mr. T. C. Pullinger's 16—20 h.p. Beeston Humber; second prize (club silver medal), Mrs. Benett Stanford's 13 h.p. Dixi.

Class C—First prize (cup presented by Sussex County Automobile Club), Mr. E. Manville's 30 h.p. Daimler; second prize (club silver medal), Mr. E. M. C. Instone's 30 h.p. Daimler.

In addition to the prizes enumerated above, the club is giving a gold medal to the car which does the best performance according to the club formula. The winner of this medal will not be ascertained for several days. It should be added that all the competing cars were genuine touring machines, fitted with lamps, mudguards, silencers, and touring bodies, the racing car in touring guise being rigidly excluded.

The Midland Automobile Club Hill-climb.

An interesting hill-climbing competition was conducted by the Midland Automobile Club on the 3rd inst., near the picturesque village of Broadway, famous as the residence of Mrs. Navarro (Miss Mary Anderson). The actual contest took place in the private grounds of Middle Hill House, the residence of Baron Max de Tuyll. The results were determined according to two formulæ, one for arriving at the actual horse-power, and the other for handicapping purposes, the last named being the time in seconds multiplied by the horse-power, and divided by the total weight in pounds. On these formulæ, the cup offered by the club was awarded to Mr. H. P. Barker, who drove a 10 h.p. De Dion, and the following list shows the order of merit of the first ten competitors; for purposes of comparison we also append the actual times made:

Order of Merit.	*Driver.*	*Car.*	*Actual Time.*
1.	H. P. Barker ...	10 h.p. De Dion	9min. 40 3-5sec.
2.	E. W. Lewis ...	8 h.p. Rover ...	8 ,, 4 2-5 ,,
3.	E. M. C. Instone ...	30 h.p. Daimler	4 ,, 42 4-5 ,,
4.	A. J. W. Millership	6 h.p. Wolseley	8 ,, 41 1-5 ,,
5.	R. R. Brown ...	10 h.p. Wolseley	8 ,, 8 3-5 ,,
6.	J. Mayfield... ...	12-14 h.p. Climax	8 ,, 13 4-5 ,,
7.	W. T. Stokes ...	8 h.p. Allday ...	9 ,, 51 2-5 ,,
8.	Mark Wild... ...	6 h.p. Wolseley	9 ,, 38 ,,
9.	Percy Martin ...	35 h.p. Daimler	4 ,, 42 4-5 ,,
10.	A. A. Remington ...	6 h.p. Wolseley	9 ,, 5 ,,

Four other competitors retired.

POLO NOTES.

It was, after all, a good idea on the part of the Hurlingham management to have their pony show earlier than usual. We like to see before the great matches the ponies that are to take part in these struggles, for it is the charm of Hurlingham that they show us there the great playing ponies. In every case that I can recall the winners have been ponies famous in the game, and the record of past champion winners would supply the names of most of the notable ponies from the days of the Peat family to the present time. "Better even than Matchbox," was the verdict of a well-known judge on Captain Miller's Worcester, winner at Roehampton and at Hurlingham in the heavy-weight class. The pony was shown in working condition, and will, no doubt, look better; but no one could possibly doubt his power not only to carry the 14st. and upwards of the conditions, but to do this at a good pace. This pony is a nice brown, with no white, a very good forehand, and, without being long in the back, he has plenty of reach and scope. With sufficient bone and a deep girth, he carries weight by his conformation rather than by mere size. He is, I believe, what one may call a hunter-bred pony, or a pony which was bred on hunter lines. Mr. F. Bellville's Attorney and Mr. Garland's Dr. Horace, the second and third ponies, were very much on a level. Dr. Horace is the more taking pony of the two and up to more weight. He has the first-rate back and loins which count for so much in a polo pony. The light-weight class not only showed us some excellent types, of which Mr. G. Miller's Bunny Rabbit is all over a polo pony, but brought out a new star in Major F Egerton Green's Ragman. Shown almost in the rough, he stood out from among the others, and nothing seemed to move better; if he is shown again his day is bound to come. In remarking that he is a little short in the shoulder you find almost all the fault possible. In the

MR. J. B. DALE'S MY HONEY.

Champion class Mr. McCrcery's Daly beat Larky. For my part, I should have preferred to put them the other way, but no one could say there was a great deal in it, and it must always be remembered that the judges ride the ponies and their critics do not. Mr. Game, Mr. Nigel Baring, the Master of the Duhallow, and Captain Godfrey Heseltine were the judges, and would have been joined by Mr. Buckmaster had he not met with an accident. It was this mishap that obliged the Orleans team to withdraw from the final of the Social Clubs, and deprived us of a very attractive-looking game with White's A Team. This latter now holds the Social Club's Cup for 1905. Mr. St. Quintin at once arranged a match for White's, but it was, of course, though interesting enough, not quite the same thing as the final of a tournament would have been. But there was another event which makes last week memorable in the annals of polo. A first-rate match was played before two Kings at Ranelagh. King Edward and the young King of Spain drove down quietly on Wednesday. Ranelagh, of course, was equal to the occasion. A match was arranged on the new ground. A pavilion with a raised daïs was erected near the ordinary stand, and in rather dull weather, with but few people present, the King of Spain saw an English polo match. There is a polo club at Madrid, and some Spanish players have been, and, indeed, still are, among the most skilled of Continental players. There is something in the chivalrous dash of polo which appeals to the Spanish. The young King entered into the game with the most unaffected enjoyment, watched every stroke, and seemed to leave with some reluctance. We should like to have shown him the most beautiful of our clubs at its best; but Ranelagh even on a wet day is picturesque, and not even a rather dead ground could spoil the match arranged by the managers. Though at short notice, the players were all in the first class. The Wanderers—the Hon. A. Hastings, Mr. F. M. Freake, Mr. E. B. Sheppard, and the Duke of Roxburghe—met a club team chosen by the polo managers with their usual skill in balancing players. Indeed, as the match ended in a draw, it was a notable feat of handicapping, on a ground so dead that the best players might well have lost their form. The club team was Captain L. C. D. Jenner, Captain Godfrey Heseltine, Mr. F. A. Gill, and Captain Hardress Lloyd, and students of polo will note how the two ends of the team, the forwards and the back players, were balanced so as to produce the most perfect combination. This team was an illustration of the advantage of brilliant forward play when well supported.

To look forward to the future—for the past has but a slender record—next week we shall have the Army Cup for soldiers past and present. This has secured a splendid entry, and the teams include nearly all the first-class players of our soldier teams. Dragoon Guards, Royal Artillery, Hussars, and Infantry are all represented, and members of the Old Cantabs, the Magpies, and Ranelagh Club teams will be found in the competition. Altogether this promises better than any tournament played up to the present.

I have the draw for the Inter-regimental—1st Life Guards play 2nd Life Guards; Royal Horse Guards, the 21st Lancers; the King's Dragoon Guards, the 3rd Dragoon Guards, 5th Lancers, 6th Dragoons, 8th Hussars, 11th Hussars, 20th Hussars, and 17th Lancers all have byes in the first round. The 14th Hussars play the Rifle Brigade, and the Scots Greys the 16th Lancers. The prospects for this tournament are very bright, and we shall all look forward to the semi-finals on July 5th and July 6th. X.

CRICKET NOTES.

THAT a fast bowler is, practically speaking, essential to a team is self-evident; but really good fast bowling is not easily found. The first requisite is pace; it is just the bit of extra pace that distinguishes a fast bowler from the man who can send down what might be called a fast ball—Kottright, for instance, depended entirely on his extra pace to get wickets, and history tells us how often he succeeded. Then great accuracy in pitch and direction is peculiarly necessary to a fast bowler, or he is sure to prove very expensive, especially on the leg side; and even if he does keep a good length and direction, on a really true wicket, fast bowling is probably easier to play than any other, provided that the batsman judges the ball correctly and plays forward with a straight bat. The effective fast bowler is the one who will keep the batsman on the look-out by sending in a slow one from time to time, and who can combine his pace with plenty of spin and break. Only a few days ago the writer saw Lockwood playing apparently as well as ever in a village match, and memories came back of his great feat in the Test Match at the Oval in 1899, when on a perfectly true wicket he took seven wickets for seventy-one runs. Bowling at a terrific pace, many of his balls broke right across the wickets, and they came off the pitch like lightning, and taken altogether his bowling that day was an example of what a really first-class fast bowler can do; but fast bowling of that sort is very hard work, and few bowlers nowadays seem to care to attempt to develop their powers in that direction.

C. B. Fry has been batting in marvellous fashion this season, some of his best performances being 156 and 106 *v.* the M.C.C., and 201 not out and 233 *v.* Notts, and his average up to now is 106 for twelve innings, with a total of 1,060 runs. Denton for Yorkshire has scored 107 *v.* Somerset, 132 *v.* Warwickshire, 102 *v.* Middlesex, and 153 not out *v.* the Australians; he is sixth on the list of averages, with 57·78 for fifteen innings, and a total of 809 runs.

With Lord Hawke, Mr. Jackson, and Hirst absent from their ranks, it seemed as though Yorkshire would be easily defeated by the Australians; but Yorkshiremen are proverbially slow to acknowledge defeat, and they actually did better than any team has hitherto done against the Colonials, excepting, of course, the All-England Eleven at Nottingham. The honours of the match went to Denton and Ringrose, the latter of whom is a particularly fine bowler, especially on a good wicket. He is just the style of bowlert hat Yorkshire want, and if he maintains his recent form there are more unlikely things than that Yorkshire may recover the County Championship. Some critics would have it that Denton's fine innings of 153 not out was by no means free from faults; but not even the most critically-disposed can deny that he played cricket of an extremely bright and interesting character. The unexpected so often happens in cricket that one cannot say positively that Yorkshire would have won; but with only four wickets down they were in a position to declare the second innings closed, and at one time their sporting attempt to win the match seemed likely to succeed. But Noble and Armstrong came to the rescue of their side, and were still together at the termination of the play.

C. B. Fry gave one of his extraordinary batting displays for Sussex *v.* Notts, being given out leg-before-wicket after putting together the fine total of 233. With eight wickets down for 469, Fry declared the innings closed, and the Sussex bowlers went to work to try to get rid of the Notts batsmen quickly enough to win the match. Even the most sanguine partisans of Sussex could hardly have expected the sensational cricket which followed. In two hours and a quarter the whole of the Notts team were dismissed for a total of 62, and Sussex had won by an innings and 215 runs. These two counties have met on fifty-six occasions, and Sussex has only been victorious seven times.

FOR TOWN & COUNTRY.

FEW of us realise when we partake of even simple dainties, such as an ordinary boiled custard, the culinary care that is necessary to prevent the eggs from curdling, and the ingredients from being spoilt. There are not many instances in which a substitute for eggs can be so successfully effected as in that of making a custard, and the use of Bird's excellent custard powder saves all anxiety and ensures success. During the hot weather it is particularly valuable, as custard and fruit, both stewed and in tarts, are always appreciated. With the use of custard powder the making of ices becomes a very simple matter, and all directions for making them will be found in an attractive little booklet, entitled, "Pastry and Sweets for Dinner and Supper Tables." It contains over a hundred practical recipes for puddings, omelettes, and dainty cold sweets, also for cakes (which can be made without eggs), bread, pastries, and an excellent recipe for home-made ginger-beer. The booklet can be obtained free from the publishers, Alfred Bird and Sons, Birmingham.

At the Annual General Court of the Royal Exchange Assurance Corporation on May 31st, it was decided that a further dividend of 10 per cent., free of income-tax, should be paid, making a total of £14 per cent. on the capital stock for the year 1904. Investors and insurers alike will do well to keep an eye on this company, managed, as it is, by some of the shrewdest and most respected men in the business world.

With the advent of hot weather a dislike is felt to the heaviness of the orthodox "cut off the joint," but it is as well, when picnicking off potted meats, fish pastes, and so on, to be certain that the methods of preparation leave no loophole for deleterious substances to find an entrance. Messrs. John Burgess and Son, Limited, of 107, Strand, W.C., have long had a reputation for all delicacies of this kind, including anchovy paste, soups in tins and glasses, and pickles, fruits, and sauces; and to the bachelor in chambers and the tired housewife these labour-saving dishes will lend assistance when cooks or servants are on strike, or in other emergencies.

Everybody knows that

SEVENTEENTH CENTURY CHAIRS.

THE development of the chair as a recognised article of furniture belongs to the seventeenth century. Before that period it existed, of course, but hardly in its later intimate relationship to civilised mankind of every degree. The use of it was a matter of state and dignity; the common herd sitting—if indeed, they presumed to sit—upon stools or settles, such as one still finds, in fortunate moments, in the farmhouses and inns of the more remote country districts. It seems probable that the Civil Wars had much to do with the democratisation of the chair. With the rise in the social world of the middle classes we find that domestic furniture, during the latter half of the century, increases and multiplies; not only in mere numbers, but in form. The development of this branch of art in France and the Low Countries found an echo in Great Britain; and one of the most interesting of the changes is to be found in the variations which, doubtless under French influence, now sprang from the old settle. One of our illustrations represents a fine example of the double chair. Its straight back and arms are reminiscent of certain characteristics of Stuart chairs, and the carving, if its theme be derived from the ornament of Louis XIV., is in execution typically English. The desire for greater comfort was not the only incentive to change. The old oak furniture was too heavy for daily use, and lightness becomes more and more a serious consideration with designers of chairs. The use of cane was a happy expedient; and the high-backed single chair reproduced on this page exemplifies its utility in the clearest manner. The back is essentially Elizabethan in style; and it supplies an unusual contrast to the heavy and later carving of the lower portion. The simplicity of this example finds its antithesis in the luxuriant carving which decorates the back of our third illustration. One cannot help remarking that this elaboration could hardly have been quite appreciated by the sitter. Yet reticence in the other parts shows that the workman had a very good idea of giving prominence to the chief product of his handicraft. He has been content with turned legs, quite tastefully proportioned, but almost devoid of carving. As an exhibition piece this is an effective specimen. Foreign influence is apparent—even dominant; but one values it, nevertheless, as belonging to that period of absorption of the ideas of alien craftsmen out of which the independent and typically British school was to arise. E. F. S.

DOUBLE CHAIR: SECOND HALF OF THE SEVENTEENTH CENTURY.

ARM-CHAIR: LATE SEVENTEENTH CENTURY.

CANE-BACKED CHAIR: LATE SEVENTEENTH CENTURY.

ONE of the chief events of last week was Mme. Le Bargy's appearance on an English stage with an English company. Of the play itself and the acting it is not my province to speak, and, besides, it is in a way ancient history by now; but what is by no means ancient history are the dresses which Mme. Le Bargy wears in "The Man of the Moment." Even as her husband is celebrated as being the only man in Paris who can tie a cravat (his cravats are generally remarkable, and evidently the object of deep thought and preparation), so Mme. Le Bargy has a reputation as regards dressing which she certainly sustains at the St. James's Theatre. In the accompanying sketch the half-length figure on the right illustrates the charming robe d'intérieure which Mme. le Bargy wears in the first act of the play. I suspect it to hail from Doucet, for from that famous house came the almost similar dress worn by Mlle. Lender in "L'Ange du Foyer" at the Nouveautés in Paris last spring. The under-dress is in white muslin and lace, the skirt having two deep flounces of lace, headed with an insertion. The bodice has a transparent yoke and high collar-band of lace; the muslin is drawn down in a deep point at the waist in front, and the bodice is banded with three lines of satin ribbon, ending in front in bows of graduated sizes. The feature of the dress, however, as it was in Mlle. Lender's, is the most fascinating coat of spotted net trimmed over the shoulders and all round with heavy silver embroidery, the weight of this embroidery giving an admirable swing to the transparent net. Stole-ends of the embroidery come over the shoulders, intermixed with touches of deep green. This green-edged embroidered band reappears lower down at either side in front, reaching upwards from the hem, but leaving a space at the waist-line before the stole-ends are reached. The note of green is used in the same way at the back in ascending lines, but not round the border like the silver embroidery. Long scarves of lace hang loosely over the shoulders, back and front, ending in silver tassels. This net coat is cut very full, and hangs most beautifully, thanks to the heavy silver embroidery. The sleeves belong to the under-dress, and are made of puffs and flounces of lace reaching to the elbow. In her beautifully-dressed fair hair Mme. Le Bargy wears a dainty little knot of black velvet. The second dress in the sketch represents Mme. Le Bargy's dress in the second act, which is particularly graceful and effective. It is a Princess dress in deep champagne-coloured chiffon, the Princess effect being accentuated by long lines of deep gold sequins. The sequins are massed round the upper part of the bodice with a bolero effect that gives a beautiful firm line under the arms, and they also form a huge butterfly and large leaf designs round the hem of the skirt. The décolletage is draped with string-coloured lace, which also forms the full, puffed elbow-sleeves; and from

DRESSES WORN BY MME. SIMON LE BARGY.

the right shoulder to the front is a garland of roses in curious subtle shades of pink and blue, caught at the breast by a bow of satin ribbon in the same tone of pink, while a similar ribbon ties the lace sleeves. With this dress Mme. Le Bargy wears in her hair a black osprey, not smartly erect, but slanting backwards, according to the fashion that prevails in all millinery at present, but which is certainly not decorative. In the last two acts Mme. Le Bargy's costume is the same, a charming white toilette, consisting of a coat down to the knees of white filet lace, over a skirt of white poplin. The dominant note in all her dresses, which is always the special feature of Doucet's designs, is simplicity of line; long flowing lines, which accentuate womanly grace, and the simplicity which denotes refinement of taste, and is in such marked contrast to the overloaded, flounced and furbelowed dresses one sees but too often in many houses of dressmaking repute. There is no easier way of hiding defective cut and style than a profusion of flounces and bouillonnés, which distract (and often afflict) the eye; and so it is naturally popular with many dressmakers to overload their costumes in this way, which indeed is also popular with many of their clients, who do not feel that they are "getting their money's worth" if a dress is exquisitely simple. The dresses of the charming French actress at the St. James's should correct many errors among our English actresses, the majority of whom are often sinners in this respect of allowing their dresses to be overloaded and confused in detail; and the beauty of simplicity of outline, which I am always preaching, is admirably illustrated by Mme. Le Bargy.

Beautiful cloaks are a special weakness of mine, and I was drowned in a sea of covetousness and envy when I surveyed the cloaks in the mantle department at Messrs. Marshall and Snelgrove's this week. There were cloaks for all occasions, each more beautiful and original than its predecessor. A most charming coat was a sacque, three-quarter length, in shot taffetas, which was just the thing for an Ascot wrap. For warmer wear there was a beautiful circular cloak in a lovely shade of ruby plush, longer at the back than in front, which had a very graceful effect, the trimming being cascades of old lace, which looked splendid against the rich crimson of the material. But the most beautiful of all was the cloak I have had sketched for the delectation of my readers, so that they may share the feelings of covetousness with which I regarded it. It was made of the finest, silkiest, lightest cloth, pale blue in colour, cut in a circular shape, which made it fall in the most beautiful voluminous folds all round, almost to the edge of the skirt. It fell over the shoulders in Oriental fashion, the armhole being a deep slit; and the drapery below was caught together in a very original way, the square folds being held together with an immense tassel of blue silk and gold. The sleeves were formed of wide cascades of Alençon lace, caught together by motifs of guipure passementerie, and heavy tassels. There was a deep pointed yoke at the back of beautiful Eastern embroidery in gold thread, which also descended in a wide band along the line of the shoulders, edged at each side with an inch-wide flat gold braid. This gold braid descended down the fronts of the cloak to the hem, where it was met by two narrow lines of gold braid which edged the cloak all round at the bottom. The cloak, which was unlined, fell loose and straight from the shoulders; and a most excellent feature was the lace vest, which fastened across the chest, thus giving a protecting veil over the décolletage, as well as an additional decorative effect to the whole garment. A more beautiful or picturesque cloak for either evening or afternoon wear it would be impossible to conceive, and its fortunate possessor may well be envied.

Novelty is not always the best recommendation; and in some things our forefathers knew better than we do. In nothing is this so truly shown as in the question of the lighting of dinner-tables. Our forbears knew that there was nothing so becoming as wax lights, and latter-day hostesses have come round to their opinion. The soft radiance of wax lights is beautifying to both old and young; but wax candles have the drawback that as they burn down they require constant attention lest the candle-shades should topple over and catch fire. This commonest of accidents, which always costs a dainty shade, and often burns a hole in a valuable table-cloth, even when it does not do worse and set fire to a lady's dress, would be entirely obviated if Clarke's Cricklite lamps were universally adopted for dinner-tables, as they deserve to be. These "fairy lights" can be inserted into any ordinary silver or china candlesticks or candelabra, or, of course, can be had in the charming cut-glass or other lamp-stands provided by Messrs. Clarke. The lights cost one penny each, and burn steadily for five hours. There is no difficulty as regards cleaning, for once the light has burned out, the plaster wick sustainer is removed, and the lamp is ready for another light; and the lights will keep in good condition in any climate for an indefinite period. Nothing more handy or more beautiful in effect than these lights could be imagined; and the loveliness of their soft yet brilliant radiance may be seen at 137, Regent Street (the new premises of Messrs. Clarke), where a large dinner-table, set out with glass, plate, and flowers, illuminated by a number of Cricklite lamps, with lovely little shades of soft rose silk and deep fringes of tiny glass beads shimmering in the light of the unseen lamp, is an object-lesson in table decoration worth seeing and remembering. Other shades are in silk-lined chiffon embroidered with tiny garlands of flowers in coloured silk and mounted in eight panels; and, indeed, lamp-shades of all kinds are a speciality at Messrs. Clarke's, for the whole of the first floor is given up to nothing else but shades of every imaginable size, colour, and material.

LAMIA.

EVENING CLOAK AT MESSRS. MARSHALL AND SNELGROVE'S.

What it is.

Composition of the Famous GRAPE-NUTS Breakfast Food.

A widespread interest has been created as to the composition of **GRAPE-NUTS**, the popular fully cooked food. It has long been known to physicians, chemists and food experts that the starchy portion of entire wheat flour and barley is transformed into a true and very choice sugar by the act of intestinal digestion in the human body. This sugar is identical with and is known as grape sugar, and it is in condition for immediate transformation into blood and the necessary structure from which the delicate nerve centres are built up.

A food expert followed a line of experiments until he produced the food called **GRAPE-NUTS**, of which grape sugar forms the principal part, and it is produced by following out nature's processes in a mechanical way. That is, heat, moisture, and time are the methods employed and directed by scientific facts gained in research.

GRAPE-NUTS food is probably entitled to the claim to be the most perfectly adapted food for human needs now extant. Certain it is that the users delight in the flavour. The perfect action of intestinal digestion during the use of **GRAPE-NUTS** is satisfying, and the added strength of body proves its merits.

RICHMOND HORSE SHOW.

THIS horse show is such a pretty and popular function that general regret will be felt that the weather was not all it might have been this year. On Friday it was beautiful, but Saturday proved to be wet, and there was some falling off in the number of visitors. Even on the first day of the show complaints were heard that the programme was not carried out according to the letter. The catalogue gave it to be understood that the first judging would be the four classes of hunters, but, as a matter of fact, these were not taken until Saturday. And there was some other zig-zagging in the judging, which had the effect of puzzling the spectators. It is very desirable that on future occasions the catalogue should be carefully drawn up and adhered to. The show of horses was intrinsically very good indeed. In weight-carrying hunters, Mr. Drage was first with a bay gelding, which also took first prize in the class for novice hunters, and Mr. Stokes was second. In the four-in-hands Mr. H. H. König secured the first, with a team of browns, though the decision was not very well accepted by the crowd, who had set their minds on the team driven by Miss Ella Ross, but probably the judges were right and the crowd wrong. Mr. König and Mr. W. S. Cunard were bracketed for tandems. For pace and action horses Mr. W. Winans took the first prize, and all the others.

But the 527 entries included many animals besides these, and it was generally asserted by the experts present that the quality of horseflesh never has been better during the fourteen years in which a horse show has been held at Richmond. Two gold vases were given this year for the first time, one worth 100 guineas and the other 150 guineas. They are the gift of a number of gentlemen who are lovers of horses and interested in the art of driving. They laid down the salutary rule that, in competition for them, "horses entered in these classes must be the *bonâ fide* property of a lady or gentleman not in any way professionally interested in the purchase or sale of horses, and must be driven by the owner, or a member of his or her family, in whose possession it must have been for at least two months prior to the date of the closing of entries." The entries certainly did credit to the donors of these magnificent vases, and the judges on several occasions had very great difficulty in deciding between the rivals. It may be worth while to run roughly through the list of Saturday's competitions. In novice

HUNTLEY & PALMERS "DESSERT WAFERS"

THE newest delicacy for lovers of good things. Light wafer biscuits of most refined flavour. Delightful with ices, sweets, or fruits. But a perfect dessert by themselves.

Elegant. Dainty. Pleasantly sweet. A triumph in fine biscuit making.

hunters the first was Mr. John Drage's Whisky; in hunters to carry under 14st. Mr. John H. Stokes was first with his Warrior; hunters up to not less than 14st. again offered a victory to Whisky; while Mr. John H. Stokes won in the open champion class with his Gold Reef. In double harness horses (pairs under 15 hands), Mr. W. S. Cunard's Jenny Lind and Wild Lucy proved too strong for Mr. Goad's pair; in single harness ponies Mr. Radcliffe's Marie Tempest proved victorious; while among single harness horses of any height Mrs. Hartley Batt's Heathfield Squire was at the top; in tandems Mr. Cunard's team was judged equal to Mr. König's; while Mr. Walter Winan's came in second. Mr. Wheeler won the jumping competition with Confidence, but Mr. Foster's Nomination took the Challenge Cup. The Challenge Vase, for double-harness horses, was won by Mr. König's Madge Kendal and Radiant. The Gold Challenge Cup, for single-harness horses, went to the same owner's Radiant, and the Richmond Challenge Cup, for hunters, to Mr. John Drage's Whisky.

LITERARY NOTES.

A TINY booklet by one of our occasional contributors, Miss Edith C. M. Dart, called *Nature Moods* (Elands', Exeter), may be confidently recommended to such of our readers as love orchards, meadows, seas, and the scenery round St. Michael's Mount. We give one or two examples of Miss Dart's verse, so that they may judge for themselves. The following seems to bring us within sight and sound of the shore:

SEA-BIRDS.

"Like bow drawn light along the strings,
To the sea's lute a soft wind sings,
Songs of faint, sweet, unworldly things,
Of breeze and surf. Ah! flash of wings,
Sea-birds go by!

Poised on a wave's turn—then away!
Grace of white curves 'neath boulders grey,
Lost in the haze across the bay,
What long-shut doors fly wide and stay,
Sea-birds go by!

Gleaming and song with an empty sky,
Piercing call of a gull's long cry!
Far hundred leagues the cities lie,
We want them not, the sea nor I,
Where birds go by!"

There is, again, a delicate touch in the poem called "Evening in the Orchard," which will be very evident to those who read the following lines:

"Late-flowering apple blossoms here and there
Drop loosened petals on the evening air,
That in the faint breath of this summer night
Upon the grasses tremulous alight.
And every tuft and root of weed and flower
Yields its damp fragrance to the dusky hour.
The world lies scent and shadow—twilight—dew,
Above, stars glimmer in the failing blue:
And like the sunlight I am loth to pass
From the long swathes of daisied orchard grass."

Miss Dart, however, ought to be a little more careful of her grammar, and should not write

"Lest sea or sky believeth
Each only may be blue!"

and occasionally a word, to say the least, is not inevitable, as when she writes:

"She bore a sceptre as she trod,
Of aromatic golden rod";

"aromatic" is prose.

Mrs. Violet Jacob is another contributor whose work frequently receives a welcome in our pages, and the book which she modestly calls *Verses* (Heinemann) more than justifies it. Mrs. Jacob writes up to a very high level, and seldom falls below it. Perhaps we could excuse an occasional drop if here and there we had the recompense of a wilder flight of fancy. It is all so good that we wish some of it were a little better. As an example of her at her best, we quote the following:

"COME ON, COME UP, YE ROVERS!

Come on, come up, ye rovers
Whose ships at anchor ride,
The west wind stirs the clovers,
And O! the world is wide:
So, up with your chains as the sun goes down
And out upon the tide!

There drives on the Atlantic
The torn scud of the rain,
And lines of foam leap frantic
Against the coast of Spain,
Where the air is full of the souls of men
Who sailed the Spanish Main.

Where Rocca's light is burning
On plunging miles of sea,
Eastward and eastward turning,
By Crete and Tripoli,
There is a spirit abroad in the wind
That cries aloud to me.

The coast drops low behind you,
The gull swoops round the spars;
Shall small men's limits bind you
Whose milestones are the stars?
Whose signposts stand where Orion swings
Above earth's locks and bars?

Come up, ye sons of morning,
This world was built for you!
Far off, Heaven's light's adorning
The lands where dreams come true;
And the Angel that sits at the Gates of the East
Shall open and let you through."

Mr. Douglas Ainslie is more ambitious, and gives the name of *Moments* (Constable) to his effusions. He seems to have spent one of the pleasantest of these moments in bed, and thus in verse does he discoures of it:

"THE DREAM.

Last night as I lay a-dreaming
Alone in my frozen bed,
Meseemèd I caught the gleaming
Of thine imperial head.
Then me from my place upraising
(For I sat far away)
I thridded the crowd a-gazing
On the players at their play.
But when our eyes a-meeting
I was piercèd by the gleam,
I knew by thy sweet smile-greeting
In my dream it was a dream."

Who Was He? (Routledge) is a little waistcoat-pocket miniature biographical dictionary which we think will prove quite useful, though it some of the people who considered themselves of importance in their day saw to what small dimensions their careers are reduced they might suffer in self-estimation. We turned up a few well-known names just in order to see what was said about them: "Alfred Tennyson, 1st Baron Tennyson (1809-92), Eng. poet (In Memoriam; Idylls of the King," which is certainly brief enough. The favourite heroine of Scotland is epitomised as "Mary Queen of Scots (1542-87); only dau. of James V. of Scotland; executed." Brief as these notes are, however, we have no doubt they will serve the purpose intended.

The American Blue Book (Harrison and Sons), edited by Genevieve C. Bancroft and Basil Bancroft, is a valuable work of reference, containing, as it does, a list of Americans and American firms in Great Britain. Such a book must be of very great service to all who have business to do with American houses.

George Whitefield's Journals, edited by William Wale (Deane, London). To this edition of Whitefield's Journals, together with his "Short Account" and "Further Account," an interesting appreciation, by Canon Hay Aitken, is prefixed, containing extracts from letters of the period anent George Whitefield. That of the Duchess of Buckingham (a natural daughter of King James II.) to the Countess of Huntingdon is particularly delightful. "I thank your ladyship for your information concerning the Methodist preachers. Their doctrines are most repulsive, strongly tinctured with impertinence, and disrespect towards their superiors, in perpetually endeavouring to level all ranks, and do away with all distinctions. It is monstrous to be told that you have a heart as sinful as the common wretches that crawl on the earth. This is highly offensive and insulting, and I cannot but wonder that your ladyship should relish any sentiments so much at variance with high rank and good breeding. However, I shall be most happy to accept your kind offer of accompanying me to hear your favourite preacher, and shall wait your arrival."

A Driving Tour in the Isle of Wight, by Hubert Garle (The County Press, Newport). This book is chiefly interesting from the account it contains of George Morland's associations with the Isle of Wight, of Shanklin, and its chine in particular. In connection with such anecdotes as that of Morland's arrest as a suspicious character while sketching Yarmouth Castle, and his drawings of a spaniel and the unfinished picture "Paying the Ostler" being taken for maps and keys of the island by the unartistic justice of the peace, a portrait of the famous Mr. Plumbley of the George Hotel, and other sketches are reproduced.

Derbyshire rivers have never lacked enthusiastic pens to record their scenery and their fish, and the last work by Mr. Walter Gallichan, *Fishing in Derbyshire and Around* (F. E. Robinson and Co.), will be welcomed by both those who live in the Midland county and strangers who intend to spend a holiday there. The information as to when and how to fish for its trout and grayling is sound, and where the names of tackle-makers are introduced it is evidently done in the interests of the fisherman and not the tradesman. Unfortunately, when the reader turns to the "Where to Fish," he must be warned that this book cannot be everywhere relied on as being either accurate or up to date. For instance, on the first pages of Chapter XIV. no mention

is made of the four guineas—entrance-fee—to the Darley Dale Club; and members receive ten, not twenty, transferable tickets for friends. Again, Allen of Rowsley, described as a good fly-dresser, had died before the publication of this book. Other information noted as inaccurate is that in regard to the riparian ownership of parts of the upper Dove, which the author would do well to correct in any future editions. Still, the whole book is so charmingly written, and with all a fisherman's love of his craft, that it will be a welcome addition to the angling corner of the library.

His party owe a lasting debt of gratitude to the genius of that genial caricaturist Mr. F. C. Carruthers Gould for the indefatigable way in which he has fought their battle during the last decade, with resolute persistency and never-failing good taste. The public, including his political opponents, are indebted to him for many a hearty laugh and quiet chuckle. All alike will welcome the No. 9 of his "Westminster Cartoons" (the *Westminster Gazette* Office), covering the period 1904-5. Almost inspired in its happiness is his adaptation of the well-known advertisement, "His Master's Voice," to the Prime Minister listening to the Caucus Commissionophone, and Mr. Chamberlain, as ever, is a favourite subject. No. XXXIV., "A Memory," is an excellent portrait of Sir William Harcourt listening to a Budget speech in a most characteristic attitude.

THE NORE TO DOVER.

SATURDAY did not prove a very favourable day for the popular yacht-races between the Nore and Dover. The morning opened very dull, and fog set in early in the day. Those who were on board the yachts had an unique opportunity of studying the behaviour of birds in thick weather, for here and there a number of pigeons which had evidently lost themselves in the fog kept circling round and round the yachts. On land, these birds, if they could not rise above the fog, would have settled on the nearest perch that they could find, and waited, looking very rumpled and dismal, till the fog cleared; but here they were afraid to settle, and merely circled round the vessels. On the other hand, a little fly-catcher that, by some mischance, had got out to sea was even more discomfited. It followed the club steamer for some time, afraid to leave it and go off into the mist, and yet too timid to seek refuge where there were so many of its human enemies about. At length, however, it did alight—a poor, half-drowned-looking object; but only to flutter off again, when it flew about for some time in dismay, returning at length to the vessel. All on board were extremely interested in its fate, and were glad to allow it to perch undisturbed, when it finally alighted on one of the spars, where it sat looking miserable and half-drowned till the vessel approached land; then it joyfully took its departure, and we may be sure bade a cheerful farewell to the water. The whole occurrence was very interesting to naturalists, as tending to show what must be the behaviour of migrating birds when caught in mist and fog. Some probably are able to rise above the cloud and continue their flight, but at times it must be too much for them, and they can but perish. No one who saw these birds on Saturday would ever again believe that they have any miraculous instinct of direction, because they were obviously trusting to their sight, and when that failed seemed to be completely beaten.

Copyright TOWING TO THE NORE. "COUNTRY LIFE."

The races themselves proved to be a somewhat weird performance, as the companion yachts no sooner came in sight than they began to drift silently into the darkness, looking gradually more and more like phantom ships upon a phantom ocean, until the thickness overwhelmed them and they were seen no more. The conditions, as may be supposed, were not very suitable for racing. Not only was there too much rain and fog, but also an entire absence of wind, which caused many incidents. Valdora, Senga, and Eilun all fouled at the mark-boat. As might also be expected, the finishes were extremely late; indeed, the last boat did not arrive at Dover until about three o'clock on Sunday morning. In the handicap for yachts of any rig exceeding 100 tons Thames measurement, the first prize-winner was White Heather, belonging to Mr. Miles Kennedy, Brynhild being second, and Valdora third. White Heather was the scratch boat, and allowed Brynhild 9min. 54sec., and Valdora 19min. 48sec. We have only space to summarise the results in each of the other races. Mr. Stothert's Rosamund was the winner in yachts of any rig exceeding 50 tons and not exceeding 100 tons. Sonya was the winner in the 52ft. linear rating class. Viera won the handicap for yachts exceeding 25 tons but not exceeding 50 tons. She won on her time allowance, the Induna being first home. In the handicap for little yachts, not less

BARNET ORTHO PLATES & BIRD PHOTOGRAPHY

Gannets on Nest with Young. Chas. Kirk, Photo.

Copy. 156, Sauchiehall Street, Glasgow,
Messrs. ELLIOTT & SONS, Ltd., Barnet. May 9th, 1905.

Gentlemen,—With reference to my book of bird photographs, I have great satisfaction in stating that most of the negatives were made on Barnet plates, and since the introduction of the "Barnet Orthochromatic Plate" a new power has been placed in the hands of those who specialize in the photography of living wild birds. I have always found these plates of sufficient rapidity—even for focal plane work—giving good rendering of colour values without the use of a screen and in every way to be highly commended to the naturalist photographer.

Yours truly, (Signed) CHARLES KIRK.

POLO NOTES.

THE week was half over when we were able to begin polo again. Ranelagh had secured the best entry of the season for the Army Cup, five teams, and not four teams, as stated last week, being drawn. But not only was the entry a good one, as first-class tournaments go nowadays, but the matches were close, well fought out, and exciting. It was, perhaps, to be expected that the Royal Artillery —Captains Peel, Aldridge, Gosling, and Baron de Robeck—should beat the Hussars—Mr. Burdon, Mr. Palmer, Mr. Dunbar, and Captain Lee—for the R.A. were almost a regimental team, whereas it took all Captain Lee's skill as a leader to bring his team into coherence. How good the material was the second half of the match showed. The R.A. made three goals in the first three periods, the Hussars none. Then, in the last tens, the latter team made three as against one of the R.A., who thus won by 4 to 3. It seemed as if, with a better start, the Hussars might have won. The R.A. appeared to have a hard task set them when they were called upon to meet the Infantry. I have always thought that the team that could beat that would be the winners; but one was hardly prepared for the completeness with which the Infantry team overthrew the Royal Artillery. But then the team included Captain Wilkinson, who was one of the strongest men in the old Durham Light Infantry team, Captain L. C. D. Jenner, than whom there is no better among the Soldiers Past, and Mr. Ulric Thynne, the well-known captain of the Magpies. This team fell into their places at once, and with Mr. P. W. Nickalls as back proved strong enough for almost any class of tournament. The Dragoon Guards were a strong team, Captain Lockett, Captain Heseltine, Mr. F. A. Gill, and Captain Lloyd making up a powerful four which beat the Household Brigade—Mr. E. V. Boulby, Mr. Ashton, Captain Fitzgerald, and the Duke of Roxburghe—by 6 goals to 1.

The weather gave promise of a first-rate game for Saturday, which, as we know now, was not fulfilled, for the rain came down and polo was impossible. At Ranelagh there was a driving competition for ladies, and Mrs. Hine, Miss Barrow, Mrs. Shard, and Mrs. Stroyan all drove nicely-broken horses. I confess to liking Mrs. Hine's well-named grey Motor, for he has charming manners, moved all round, and withal showed a good deal of pace. On Saturday we are to have a show at Ranelagh, equally divided between polo ponies and harness horses, the latter being rather a special attraction at Ranelagh shows. Last Saturday, although we had no polo, the 21st Lancers gave a musical ride and played a match at push-ball. Next Saturday there will be the final of the Champion Cup at Hurlingham, but the game of the championship will be Roehampton *v.* Rugby, whenever it comes off, and it may, of course, have been played before this paper is in its readers' hands. Otherwise, Saturday may see it decided. Whichever of these two teams wins when they come together will win the Cup.

BIRD'S CUSTARD POWDER.

THE AUTOMOBILE WORLD.

CONTRARY to general expectation, the French Eliminating Trials passed off without serious accident. For weeks, and even months, past those best qualified to judge, the drivers who were about to take part in the contest, and expert automobilists of different nationalities who had examined the course, had united in protesting against the choice of the Ardennes Circuit as the site of the two great motor-races of the present year, and in predicting inevitable disaster when the cold-blooded cautiousness of practice spins was succeeded by the heat of the actual contest. One has heard the same forebodings of evil on many previous occasions, notably in Ireland in 1903, and last year at Homburg, but never were they more universal or better founded than in the case of the recent race in France. The advocates of this form of sport, or advertisement, are fully entitled to point to the remarkable absence of serious accidents, since the ill-managed Paris-Madrid contest of 1903, as evidence that motor-racing is far less dangerous than is generally supposed; but we do not hesitate to number ourselves amongst the pessimists who believe that luck has favoured the motorist, and that the ever-present possibility of a number of fatal accidents in every big motor-race constitutes a danger to the movement, which no advantage derived by individual firms can outweigh. On humanitarian grounds we heartily rejoice in the successful issue of our own and the French Eliminating Trials, and sincerely trust that the same good fortune may await the Gordon Bennett race itself, where the danger will be far greater, owing to the presence of drivers with limited racing experience, and with probably an imperfect knowledge of the course. We trust, however, that an unexpected immunity from accident will not result in a fresh impetus being given to a competition which has to a very great extent lost its original usefulness, and, in any case, represents an expenditure of energy and capital which might be utilised to far better advantage in other directions.

We believe that the days are long past when the purchaser of a touring car was directly influenced in his choice by the results of the Gordon Bennett race, or any similar competition, for the simple reason that the average modern racing machine bears only the slightest resemblance, either in construction or appearance, to the car for everyday use. It is well recognised, moreover, that a firm which succeeds in producing a successful racer, does not necessarily turn out an equally satisfactory touring vehicle. By entering for a big event a maker gains a certain notoriety, as his name is mentioned week by week in the columns of the motoring journals, but in the vast majority of cases any advantage he may thus obtain is largely counterbalanced by the non-success of his machines in the race itself. By his failure he may have gained experience in design and the selection of material, which may help him to improve his touring cars, but it is difficult to believe that the outlay could not have been made to better advantage in private experiments in his workshops and on the road.

Apart from the vague general advertisement to which we have referred, it is difficult to point to more than one or two firms who have gained in general public estimation as the result of racing during the past two or three years, a poor outcome of the enormous expenditure of capital which the motor industry has incurred during that time. On the other hand, there are makers, both in this country and abroad, who do not participate in the great international road races, but who, nevertheless, are producing cars which are universally admitted to stand second to none in general excellence. Certain well-known makers may consider it to their advantage to continue the manufacture of huge-powered and costly machines which are useless for any rational purpose, but it is to be hoped that our own Automobile Club, which for some time past has declared itself as opposed to road-racing in any form, will seriously consider the desirability of taking no further part in the Gordon Bennett Cup, whatever may be the result of the forthcoming contest.

The club's first and foremost duty is the advancement of the useful side of automobilism, and there can be no question that its efforts in this direction are seriously hampered by the heavy expenditure of time and money that a challenge for the international trophy necessarily involves. In no instance was this more glaringly illustrated than during the weeks that preceded the recent Eliminating Trials in the Isle of Man. At a time when public feeling was running highest, and the efforts of the club should therefore have been directed unceasingly towards allaying irritation and refuting the arguments of the anti-motorists, most of the chief officials and many of the prominent members of the committee were absent from headquarters, engaged in the preparations for a competition in itself fraught with danger to automobilism by reason of the possibility of accident, and which, at the best, could benefit the movement far less than any one of the club's many useful undertakings, whose progress was thereby stayed. In fairness to the body that represents automobilism in this country, it should be admitted that there were good reasons for the challenge for the Cup which the club issued late last year, chief of which was the hope that, as an actual participant in this year's race, it would be able to bring stronger pressure to bear to secure a reform in the conditions of motor-racing which might in a measure restore to it

its original usefulness. Unless such a reform is speedily forthcoming, we hope that the Automobile Club will definitely retire from the contest, and devote its best energies during the months that intervene between the present time and the revision of the Motor-car Act to the suppression of the abuses which have brought so much discredit on motorists in general.

THE FRENCH ELIMINATING TRIALS.

A YEAR ago, a firm little known to fame leapt into notoriety by winning in rapid succession the principal events at the Monaco Motor-boat Meeting, the French Eliminating Trials, and finally the Gordon Bennett Cup Race itself. On Friday last the same firm eclipsed its previous record by securing the first and second places in the great contest over the Auvergne Circuit in competition with practically all the leading makers in France. The achievement is a truly remarkable one, and proves conclusively that M. Brasier, who, before he joined the firm of Georges Richard, had added immensely to the reputation of the great Mors firm, is almost without a rival among the designers of modern racing cars. The French Eliminating Trials were singularly uneventful for a contest so fraught with possibilities of sensational incident, and though the issue remained in doubt until the very end, Théry, the holder of the Cup, was marked out in the earliest stages of the race as a probable winner. All the twenty-four cars entered put in an appearance at the starting-point at Laschamps, and were despatched at intervals of 4min., Théry, on one of the three Richard-Brasiers, being the first to go, having by an extraordinary stroke of luck drawn the number 1 in the ballot. He maintained his position from start to finish, and, so far as is known, no other competitor was ever ahead of him on time at any period of the race, except the Renault of Sizsz, which gained a few seconds on the first run to Rochefort. The cars were timed over the first 400 mètres from the start in order to ascertain their respective powers of acceleration, a matter of vital importance on so winding a course. Curious to relate, the Richard-Brasiers were somewhat slow in picking up speed, taking 26sec., 26 2-5sec., and 26 1-5sec. respectively for the distance, a remarkably consistent performance, but one that was easily excelled by the majority of the other cars. The best time was the 22sec. of Villemain's Clement, and the 23sec. accomplished by two of the Panhards, all three cars, it is worthy of note, being fitted with metal to metal clutches of the disc type.

The order of starting is shown in the table following, giving the net time for the four rounds of the course and the average speed of the competitors who finished. Ten minutes after H. Farman had left on his Panhard, Théry passed on the completion of his first round, his time for the 137 kil. 444 mètres being 1hr. 42min. 52sec., which was the best accomplished during the day, and equivalent to an average of a fraction over 80 kilomètres, or about 50 miles, per hour. The next best time, also made in the first round, was the 1hr. 44min. 40sec. of Wagner, who up to the end was regarded as a likely winner, and actually achieved fourth place. All the twenty-four cars accomplished the first lap in safety, but thenceforth the process of elimination commenced, Albert Clement dropping out in the second round, owing to a fractured cylinder, Farman meeting with an accident which wrecked his car, and the Automoto and Bernin's Renault dropping out from causes not ascertainable. At the conclusion of the second round Théry on gross running time, without deducting any delays which may have been enforced in the controls in order to maintain an interval of 3min. between the cars, was 3min. ahead of Wagner (Darracq), who then occupied second place, Duray (De Dietrich being third, 1½min. behind, Hemery (Darracq) fourth, Caillois (R. Brasier) fifth, Heath (Panhard) sixth, Rougier (De Dietrich) seventh, and Sizsz (Renault) eighth, all having made excellent times. In the third round Girardot met with a serious accident, the other eliminations being Rougier, Stead, and De la Touloubre. At the end of this lap Wagner had reduced Théry's lead to about 6min., and Caillois had taken third place, Duray having fallen back to seventh, owing to a bad round. Heath at this period was fourth, and well in the running, with Hemery fifth, and Sizsz sixth. On the last round Teste, Villemain, Bernin, and A. Fournier dropped out, leaving fifteen cars out of twenty-four to complete the race, a very high percentage for so difficult and dangerous a course.

Théry made somewhat slow time on his last round, and even after his arrival at the finishing-point the issue was in doubt, as there were still Wagner and Heath to be reckoned with. The necessary time passed, however, without the appearance of any of the possible winners who had started behind Théry, and his victory became assured. The second to finish was Sizsz (Renault), 15min. behind, followed by Caillois (R. Brasier), Hemery (Darracq) with a punctured tyre and a damaged wheel, and Wagner, who had had a very unlucky fourth lap owing to the bursting of two covers. It may here be remarked that the consumption of tyres during the race was enormous, even the winner using up five covers. Wagner is said to have had no fewer than ten punctures. Messrs. Michelin had produced a new antiskid tyre for the event, which was used on every car, and is said to have stood the enormous strain of the constant braking and acceleration, and the turning of the innumerable corners, in a far more satisfactory manner than any ordinary tyre could have done. At the conclusion of the race the deductions enforced in the three controls at Rochefort, Laqueuille, and Pontgibaud were quickly worked out, and the official announcement was made that Théry was first, with Caillois second, and Duray third. These three drivers will, therefore, constitute the French Gordon Bennett team, Wagner and Sizsz, who were fourth and fifth respectively, gaining the right to be included in the team of five which will represent France in the Vanderbilt Cup in the autumn. The winner's time works out at an average of only 72 kil. 555, or 45 miles per hour, a result which is an eloquent testimony to the difficulties of the course. Besides the honour of obtaining first and second places the Richard-Brasier firm secures the 100,000fr. given by the *Auto* for the maker of the winning car, and the 25,000fr. subscribed by the Automobile Club of France as a second prize. The maker of the third car receives 15,000fr., and Renault Frères 5,000fr. as fourth prize.

There is luckily little to record in the way of serious accidents. Girardot burst his two front covers simultaneously on the third round near Sayat, during the dangerous descent to the Clermont cross-roads, with the result that the steering-gear became deranged and the car overturned. He broke a collar-bone and several ribs, but his condition was never regarded as serious. Farman on a Panhard came to grief at the same spot, and it is said that his car disappeared over a precipice. Neither the driver nor the mechanic was hurt, however. Hemery's Darracq caught fire near Volvic, while some adjustments were being made to the ignition, but the flames were extinguished before any serious damage was done.

THE BEXHILL MEETING.

Time was when the Bexhill Meeting formed almost the sole opportunity for sport, the private track of Earl De La Warr being available before local corporations had seen the advisability of promoting automobile races, as at Southport and Blackpool. At the latter place, however, they seem likely to be an annual feature, while the Brighton track should offer a particularly good rendezvous for Southern devotees. Hence Bexhill has no longer a monopoly; and this fact was largely responsible for the comparatively small entry-list at the meeting of the 14th inst. The affair, moreover, had not been particularly well boomed in advance, while the unfortunate arrangement of the classes was also a deterrent to many who would otherwise have competed. There were only two classes for cars, one being for those with a chassis price of from £350 to £650, and the other for those of £650 to £900. Obviously, this arrangement was ridiculous, for what car anywhere near the smaller limit could hope to compete with one at £650? Between £350 and £900 there should have been at least four classes, and even intervals of a hundred pounds, say, from £300 to £1,000, would have been preferable. However, there were thirty-one touring cars entered, with five racers and fifteen motor-bicycles; and, as the quality of nearly all the competing vehicles was first-class, there were some very good performances when the times are considered, though the finishes were seldom close, as is inevitable with motor-car events, since even at thirty miles an hour a difference of 1sec. between two cars means a gap of 44ft. The racing cars proved too fast for the course, and were obliged to race over a half-mile only, with standing start. Within that distance they performed astonishingly. The following were the principal results:

TOURIST SECTION (about three-quarters of a mile).

Class C (cars with chassis not less than £350 nor more than £650).—A. H. Bush, 28 h.p. Daimler, first; H. Ramoisy, 24 h.p. Germain, second. Time, 55 3-5sec.

Class D (cars with chassis over £650 but not more than £900).—Percy Martin, 30 h.p. Daimler, first; E. Manville, 30 h.p. Daimler, second. Time, 50 3-5sec.

Class H (handicap sweepstake).—F. Coleman, White steam, first; Claude Johnson, 15 h.p. Orleans, second. No times were announced.

RACING SECTION.

Class G (cars weighing not more than 1,000 kilogrammes, for the best average time for three runs against the watch, half-mile, with standing start).—A. Lee Guinness, 100 h.p. Darracq, first—time, 94 1-5sec. for three runs; Cecil Edge, 80 h.p. Napier, second—time, 97 2-5sec.; Sir R. St. G. Gore, Bart., 100 h.p. Mercédès, third—time, 98 3-5sec.; J. E. Hutton, 90 h.p. Mercédès, fourth—time, 104 1-5sec.

Seabeach Racing.

The future of sand-racing would appear to be somewhat uncertain. Someone finds a course which he believes to be eminently suitable, and then a committee of inspection goes down and endorses his opinion. But experience has shown that both promoter and committee may be deceived by the favourable conditions prevailing at the time. They fix a date and announce a meeting, and lo, ere it comes off the sands are strewn with flotsam and jetsam, or soddened instead of firm, and the meeting proves very different from anticipations. Even the famed Ormond Beach was not perfect this year, albeit records were lowered upon it in plenty; the Portmarnock Meet last year was not completely satisfactory, though it promised well for next time; and now the Filey Meeting has taken place and proved something of a fiasco. It had been widely stated that the course was perfect, and so hard and dry that motor-cars left no visible tracks; yet on the actual day the sands were soppy, and labourers had to be employed to cut trenches and drain the water out. A great crowd had foregathered, and proved difficult to keep in order along the whole length of a mile course. The arrangements for announcing the winners were very primitive, and the events proved dull in consequence, while further disappointment was caused by the absence of several racing cars which had been expected. Even if a dry course can be guaranteed on the next occasion, it is clear that the organisation must be vastly improved.

The Side-entrance Body.

A few weeks ago (writes "Commutator") I discussed the apparent defects and virtues of the side-entrance type of body which was so much in evidence at the Olympia show. The former, I pointed out, were, in my opinion, somewhat numerous, while there was little in the way of the latter to counter-balance the apparent drawbacks. Since then I have myself become the possessor of a car with a side-entrance body—which may sound somewhat inconsistent, but was, nevertheless, inevitable. Conformity to fashion is practically imperative when one has to consider the prospect of ultimately selling one's car, at which time one wishes it to appear as little out of date as possible; and for the nonce this type of body is chiefly in favour. Then, again, the car I wanted, so far as related to its mechanical features, was only sent out with side-entrances as standard, and I could not go to the expense of a special design. What I wish to point out now, however, is the way in which every one of my contentions has been proved in actual practice; from the fact that I own the car, for better or worse, I could wish it had been otherwise. I have discovered, however, just one new factor in the side-entrance body's favour, and, small though it is, I must in fairness give it mention. The absence of the door which is found in the back of an ordinary tonneau enables the whole of the space beneath the back seat of a side-entrance phaeton to be used for storing tools, and for long articles like pumps this is a convenience, as the cupboards underneath the seats of a tonneau are necessarily small, and it is not every tonneau which will take long baskets at the sides. The faults of the new system, however, are even more conspicuous than I expected. I believe I said that the alleged advantage of the side door for ladies would often be found more apparent than real, and that one could not always find a kerb at which to draw up. In confirmation of this I may now add that during the course of a recent tour there were frequent occasions on which my wife had to step into the road just as much as if she had been on a tonneau car. She was alone in the rear portion, and the luggage was placed on the far side of the well. When we drew up anywhere on the same side as that on which the luggage was fixed, and no one was handy at the moment to take it away at once, it was necessary to dismount from the other side. Then, again, it is not always convenient to draw up absolutely close to a kerb. My front mudguards are very broad at the bottom and very low, and to strike the kerb is easy, while even in front of my own house the road has so much camber and the channel is so deep that I invariably prefer to draw up a couple of feet away from the gutter. One does not like starting with a pronounced resistance on one side only. One may have, moreover, to draw up in any town to buy petrol. If the car is over in the gutter it is impossible to fill the tank properly because of the list, so one intentionally keeps away from the kerb on that account alone; but while the filling up is being done it is more than probable that a lady will want to alight and be looking at shops! I find, too, as I expected, that the new arrangement is horribly unsocial. The back passengers are so far away that conversation is impossible unless they stand up. Some of the space devoted to the provision of the side doors, moreover, has been taken out of the footboard; hence my legs are more cramped on my 8ft. 6in. wheel-base than on my last car, which was only 7ft. 4in.; and from this fact, and the remoteness of my rear passengers, I feel like a professional chauffeur rather than the driver of my own car out for pleasure. In my case, too, at all events, the extra wheel-base is of no advantage in respect of steadiness and comfort. The car is not as well sprung as my last, and I cannot go over hummocks or a level crossing as fast as on the shorter car, which had very fine springs; and, of course, the latter was much handier at turning in traffic or tight places like a garage. Much more might be said on the same subject, but I will content myself with saying that in actual practice I do not care twopence for the latest fashion, and that if I could have my this year's engine and gear with last year's body I should be infinitely better satisfied. The side door is a town fitting entirely, but touring motor-cars are something better than Bond Street carriages.

Items.

Mr. Herbert Austin of the Wolseley Company has been elected chairman of the permanent committee of the British Motor Trades' Alliance.

The Grand Duke Michael and the Countess de Torby recently paid a visit from London to the Dennis works at Guildford, and gave an order for a 24 h.p. Dennis car. This is the second car that the firm has supplied to the Grand Duke, the first having been in use for nearly two years.

The Victoria Carriage Works, Limited, have recently supplied to Mr. Leycester Barwell of Ascot a handsome 24 h.p. Leon Bollée, a photograph of which is reproduced on another page. This is a type of car which is certainly increasing in popularity. The body is of the Roi des Belges type, and the whole top is readily removable, so that the car may be used either open or closed as desired. The same firm has received an order for a 40 h.p. Bollée from the Maharajah Cooch Behar.

A CAREFULLY-DESIGNED, WELL-CONSIDERED, AND WELL-MADE MOTOR CAR.

The Autocar, April 22, 1905.

The Autocar says:

"It was with considerable interest that we made our regular show examination of this vehicle, and promised both our readers and ourselves the pleasure of describing and illustrating it more fully in our columns at a later date.

"The makers having now put all the necessary diagrams at our disposal, we are able to do this, and we are of the opinion that the perusal and examination of the accompanying description will enable our readers to appreciate the fact that there is yet another **carefully-designed, well-considered, and well-made motor car of home manufacture** upon the market. . . . . "The examination of the accompanying plans, with the brief description attached, will, we think, serve to show our readers that in the **LEGROS & KNOWLES Car**, we have an automobile **which will do credit to the name of the English industry.** We have inspected the small but very complete works in which this car is turned out, and if up-to-date methods, coupled with the latest things in machine tools and engineering skill, can make the **LEGROS & KNOWLES Car** a popular vehicle, its successful future is assured."—*April 29th, 1905.*

SHOOTING NOTES.

NOISY BEATERS.

MR. CHARLES BOSWELL, the well-known gunmaker in the Strand, says: "Being a fairly good shot, it has been my luck to have a good deal of the best shooting given me by friends and customers at all kinds of game found in this country. When out I constantly notice what might have been splendid drives spoilt and birds lost through the noise made by the beaters, and through bad flanking. If they made as little noise as possible, and kept the outside flankers well ahead, twice the amount of game would be brought over the guns. The beaters, collected from the surrounding neighbourhood, are untrained, and talk and make as much noise as they like, and the birds are on the alert, and often rise and leave the ground before the drive begins. Hares are driven off in the same manner. In Yorkshire, on the other hand, where I enjoy grouse-driving, the beaters are nearly all sons of small farmers, who have been used to driving grouse all their lives. The way in which they are educated to bring the birds over the guns is a treat to witness. The flanking is simply perfection, and the outside flankers seem to place themselves correctly without orders. If there is a sudden change of wind during a drive they at once change their tactics, seeming to know exactly what to do to meet the emergency. The same beaters drive the same ground year after year, because no others are to be had in the district."

A LEATHER PUNT.

RETRIEVING SETTERS.

He also adds: "While on this subject, perhaps I may be allowed to give my experience as to the best dogs for picking up wounded grouse or partridges in coverts such as heather or turnips. In Cumberland and Yorkshire, when grouse-shooting, not only retrievers, but pointers and setters are used for picking up grouse after a drive. We find the retrieving setter far the best. He gathers as many as would two or three other dogs. The setter ranges so far and works the ground so splendidly that it is a treat to witness him at work. I am sure that if more setters were taught to retrieve there would be a great demand for them. They are very fast, too. A friend of mine had one of the grandest retrieving setters that it was possible to obtain. He was as ugly a dog as I ever saw, but when he began to find the wounded or dead grouse he often made guests who had brought a brace of retrievers down from London wish that they had left them at home."

DUCK-SHOOTING AT ROORKEE.

It may interest our readers to see the accompanying photographs, illustrating a day's shooting near Roorkee. The following is an extract from a letter from Captain Campbell of the Royal Engineers: "The first photograph, taken near our camp on our return from duck-shooting, shows the punt we use here. It is made of leather, stretched over a bamboo frame, and is useful for this part of the world, as it can be carried about the country on a cart without suffering any material damage. The water in the distance is a large jhil, on which we have had a good deal of duck-shooting this year. I had a very good bag at the end of a pleasant day's shooting with a friend in this district. Most of our birds were gadwall, with red-crested pochard,

ARROL-JOHNSTON CARS

Unequalled for Easy and Economical Running
BUILT FOR SOLID TYRES.

In the SCOTTISH RELIABILITY TRIALS for Touring Cars – 10th to 15th May, 1905 – a 12-h.p. Arrol-Johnston Car carried off the honours with the greatest ease, running 43.8 miles per gallon, while the next best car only achieved 35.37 miles per gallon.

These Cars are renowned for their Simplicity, Silence, Easy Control,
ECONOMY IN PRICE, AND ECONOMY IN WORKING.

The Arrol-Johnston Transmission is the most efficient known, as much as from 66 to 70 per cent. of the engine power being transmitted to the road wheels. There is a special Throttle Valve that is much more efficient than any so-called Automatic Carburetter, and effects a wonderful saving. **Arrol-Johnston Cars, Vans, and Lorries are built in 12, 16, and 20-h.p. by the ARROL-JOHNSTON MOTOR CAR Co., Ltd., Underwood, Paisley.**

Immediate Delivery of Standard 12-h.p. Car. Write for our Illustrated Catalogue No. 5, post free.

"M.M." PICKLE.
ESSENCE OF ANCHOVIES.
SAUCES OF ALL KINDS.

mallard, white-eyed pochard, and widgeon—in that order as regards numbers. I also got three pintail (all three to one shot, by the way), and saw a few marbled and one blue-winged teal. I think one of the greatest pleasures of duck-shooting is looking over the bag at the end of the day and picking out the different varieties. The second photograph is one of a crocodile I got in a drainage cut running into the jhil. We suddenly came on it about a mile from camp, asleep on the bank, with its mouth open, not more than 20yds. from us. I fired two shots as quickly as I could get them off, the first into its open mouth, and the second into its neck as it turned its head. That stopped it effectually, and it never got into the water. I had seen another on the way down, but had not been able to get a shot at it, so the following day I got a friend to come down with me, and we sent the boat back to the same place. We found the crocodile lying where I had seen it before, and my friend got it just above the shoulder. This was not enough to stop it, but we both fired as it was getting into the water, and one bullet hit it in front of the quarters. They sometimes come up again when wounded, so we waite about twenty minutes, and then, looking about, I saw it lying on its back the bottom of the stream. It looked dead enough, so we got hold of the en of the tail and pulled it on shore. We gave it two more shots, one in th neck and the other in the middle of the back, and it then still had vitali enough to bite a paddle in two, though the legs were paralysed and it coul not move. As I was using a 500 express rifle, you can understand ho these beasts often get away after they are hit. The first one was 9ft. 4i long, and the second one 10ft."

YOUNG CROCODILE.

A LOST LONDON GAME PRESERVE.

Richmond Park, the type of all that is best in English parks, w until last year the last place where Londoners could see game in an quantity, and revise in fancy their sporting memories, if they possessed an or enjoy the sight of pheasants, partridges, and rabbits in natural surrounding if they did not. Now, owing to the decision to abandon the preservation the coverts there, the whole park is rabbitless. Where th big warrens were, with scores of young rabbits playin round the earths, there is now only a waste of choppe turves, which have been let down into the trenches mad to exterminate the unhappy coneys. It is very unsightl too, though in time the ground will settle down an the grass grow. Meantime, most visitors miss th cheerful presence of the rabbits.

CORRESPONDENCE.

PARTRIDGES.

SIR,—A week or two ago a correspondent aske what success I had this spring with artificial eggs. A I can say, in reply, is that I found the partridges lai to, and sat on, them just as well and readily as the do when their own eggs are left untouched.—EAS KENT.

RACING NOTES.

WERE it not for the irresistible attraction o the Ascot Week it is probable that strong English contingent would hav been present at the opening of the grea Concours Hippique, which commenced i Paris on Tuesday, June 20th. Althoug this show may not come, strictly speaking, under the hea of racing, it serves to illustrate a subject to which attentio has repeatedly been drawn in these notes, viz., the fosterin care and liberal expenditure devoted by the Frenc Government to the improvement of the breed o

Dewar's

The Whisky of MANY Merits.

horses in the country. At this "Concours," which is entirely under the direction of the Government, over £12,000 are offered in prizes, and over 950 entries, representing all classes of horses, have been secured. Among the thorough-breds are four winners of the French Derby, a similar number of winners of the Grand Prix, and two of the French Oaks; then there are twelve Arab stallions and mares, and an interesting class is that which comprises twenty-nine specimens of the cross between the thorough-bred and the Arab. There are also strong entries in the classes for horses adapted to a variety of purposes, such as riding, driving, hunting, military work, and both light and heavy draught. Some idea of the importance attached to the subject of breeding horses in France may be gathered from the fact that out of the £1,783,000 voted for the French Ministry of Agriculture for 1905, the National Studs receive £295,500, the Veterinary Department £56,568, and the general encouragement of the rearing of horses £60,000 These Concours Hippiques are most admirably managed, and must render the greatest service to the interests which they are intended to promote.

There has been much racing in France of what may be called an International character, some of which has already been dealt with in these notes. Our English horses made but a sorry exhibition of themselves in the Grand Prix, for which Val d'Or, the solitary representative of M. Blanc's stable, started at 6 to 4, an absolutely false price, considering that he had barely had time to shake off the attack of influenza from which he had been suffering, and that he was evidently short of condition. All things being equal, there is but little doubt that he would have won, for when well he is about 20lb. in front of Finasseur, the actual winner of the race, who was bred by M. Blanc and then sold out of the stable as being not in the same class as four or five of the other colts of his age owned by M. Blanc. As things go, Finasseur has proved to be one of the cheapest bargains ever made in the way of thorough-bred stock, for after being sold as a yearling for about £300 he has now won three races in succession, which total up an amount of £17,000, and his victories in the French Derby and the Grand Prix de Paris will, undoubtedly, draw further attention to his sire, Winkfield's Pride, who, curiously enough, was also sold by M. Blanc but a short time ago for £8,000. Nash Turner rode a good race on Finasseur, and a word of praise is also due to the jockey Beaume, who made the running for him on Brat. The disease which has wrought such mischief amongst M. Blanc's horses is of a most insidious nature, and even after a horse has apparently shaken it off, one can never be sure that he will ever completely recover his form; it is most sincerely to be hoped that none of these after effects may prevent such brilliant three year olds as Adam, Val d'Or, Jardy, and Genial from continuing their successful career, and the meeting between them and Finasseur will be looked forward to with much interest.

The weather interfered not a little with the enjoyment of what may be called the holiday racing in Whitsun week. Hurst Park is always a popular resort, and there was plenty of money to be run for at the recent meeting, £2,000 being provided on the first day, and not far short of £1,500 on the second; but as far as numbers go, a poor response was made by owners to the attractive programme set forth for their approval. Primerole upset a very warm favourite in Ardeer for the Sprint Selling Plate, and in the Monday All Aged Selling Plate the well-backed Poppits just squeezed through by a head from Lady Ursuline and Stephen's Green. Some useful horses, amongst which were El Maestro, Scotch Cherry, Vril, and Wet Paint, came out for the Holiday Handicap of 500 sovs., but Goring Heath, by Cyllene, starting at 10 to 1, made all the running, and won easily by a length. Golden Measure, who has been taking part in the classic races of the season, proved too good for Cyanean and Prudent King in the Whitsuntide Plate of 1,000 sovs.; but if the winner is anything like as good as he is supposed to be, Cyanean must be coming back to the form he showed as a two year old, which was good enough to induce his present owner to purchase him for 3,000 sovs. In the Hampton Court Stakes Demure, by Blairfinde out of Shy Lady, was backed with the utmost confidence and won in a canter by two lengths. Ypsilanti had a nice exercise canter to beat Wargrave by twenty lengths for the Open Plate, and "Mr. Jersey's" Vergia scored a rather unexpected victory in the Vyner Handicap. On the second day of the meeting Captain J. Orr-Ewing's Thrush had no difficulty in winning the Hurst Park Yearling Plate of 1,000 sovs., which he did by two lengths from Lord Hastings, who finished second, four lengths in front of Honeysweet.

So many of the Manchester meetings have been spoiled by the weather, that the beautiful summery surroundings of the recent Whitsuntide Meeting were much appreciated by the numerous attendance, and the improvements which have been made were greeted with general satisfaction and approval. The race-cards issued by the executive might well be copied by others; not only was the pedigree of each horse given against his name, but the form shown during the present season by each of the horses engaged was set forth in full on the card. Mr. H. E. Randall was the owner of Borghese, the winner of the Stamford Welter Handicap, and of Cricket, who won the Thursday Selling Plate, both of them being ridden by his son. Mr. W. H. Hall-Walker's Golden Table, by Count Schomberg, just got home a short head in front of the Mine d'Or filly in the John o' Gaunt Plate. A field of nine turned out to do battle for the 1,000 sovs. attached to the Castle Irwell Handicap, and for once in a way the public fancy proved successful, though it was only by a neck that Nutwith managed to beat Kilteel after a pretty race; three lengths away from the leaders, Esquire finished third. Beyond noting that Mr. S. Joel's Horn Head won the Trial Handicap, the remainder of the day's racing calls for little comment.

Believers in omens might perhaps find food for reflection in the race for the Derby Selling Handicap on the following day, the three placed horses being The Czar, Get to Work, and Persian Garden. Just a dozen horses went down to the post for the rich Manchester Cup of 3,000 sovs., which, according to "the man in the street," was little short of a certainty for Thunderbolt, the winner of the Prince Edward Handicap in September last, but he could do no better than finish third, a head behind Whistling Crow, who was beaten into second place by Airship, who won rather easily by a length. Nirvanah, Electric Current, and Xeny ran a tremendous race home for the Beaufort Handicap; head and head, they finished in the order named.

E. LAZENBY & SON, Ltd., LONDON.

Mr. S. B. Joel has certainly no cause to regret the purchase of Waterflower, by Watercress out of Pansy, who was bought very cheaply for him in America on terms which were anything but remunerative to the agents who brought about the transaction, the performance of the filly in winning the Devonshire Two Year Old Plate by a length from a field of eight runners being quite a creditable one; of those who finished behind her, Peter Jackson and the colt by Bill of Portland out of Eidothea are sure to win races in their turn. Readers of these notes will remember that a short time ago attention was drawn to Charcot, by Gay Hermit out of Nesta, who has now won races in three continents, and I may, perhaps, remind them that it was pointed out that this horse's performances in South Africa were such that sooner or later he was bound to win a race in this country, and these hints were more than justified by the style in which he romped home a length in front of such horses as St. Brendan and Melayr for the Salford Borough Handicap of 1,000 sovs., and it is by no means improbable that before these lines are printed he will have won a race of even greater importance. It is to be regretted that Major Platt has definitely decided to disperse without reserve the stud from which so many good animals have been bred. The whole of his well-known brood mares will be sold at the July sales, and the present yearlings will as usual be sold at Doncaster. It is not often that such really well-bred brood mares come into the market, and it is much to be hoped that the best of them, at all events, may not be allowed to leave this country.

TRENTON.

CRICKET NOTES.

THE performance of the English batsmen on the first day of the recent Test Match at Lord's may have been caviare to the multitude, but to the initiated it was undoubtedly full of interest for more than one reason. The majority of our representative cricketers appear to have adopted the proverb that "caution marks the guarded way" for their motto, C. B. Fry, in particular, being completely unable or unwilling to attack the bowling. All credit must be given him for his stubborn and scientific defence; but it is difficult to understand why such a first-class batsman as the Sussex captain undoubtedly is should have been reduced to such a cramped and passive style of play. At his best, he is admittedly weak on the off side; but in the recent game he had apparently only one stroke at his disposal on the on side, and, in the second innings especially, was unable to get the ball away at all. No doubt the Australians placed their field with great skill; but it is just on such occasions as these that one expects a really great batsman to show his skill in placing the ball. As far as defence was concerned, Fry played a great game, and, with the exception of a few overs from Armstrong, he was never in difficulties, and has more than justified his claim to be included in the All England Team.

Taking it all round, when the matter is considered calmly, there is no doubt that our men played the right game, and the score of 258 in the first innings was, in reality, worth a good deal more than it appeared to be. Although the wicket was never really difficult, it was by no means a good one for getting runs. Jackson is not the man to lose an opportunity of scoring, and yet it took him an hour and a-half to score 29; and, moreover, numbers of runs were saved by the excellence of the Australian fielding. The Australian bowlers kept a good length, and although the bowling was perfectly playable, no liberties could be taken with it; both McLaren and Hayward being got rid of in attempting to hit shortish-pitched balls, from which they would have scored easily nine times out of ten. Tyldesley and McLaren both showed that the bowling could be hit, but with these two exceptions, the main difference between our men and the Australians would seem to be that the former play every ball as if they expected to be bowled, and the latter as though they intended to score off it.

When stumps were drawn on Friday the game was in an extremely interesting position, England being 252 runs to the good, with five wickets in hand. Undoubtedly they had the best of the position, but the battle was far from being over, and had the weather but held fine a very exciting day's play would have been witnessed on the Saturday. It is difficult to understand why some people should cavil so much at Armstrong's leg bowling; the theory of bowling to the off side for catches has long been practised, and there does not appear to be any valid reason why a bowler should not make a similar attempt on the leg-side. Be that as it may, it was almost ludicrous to watch the vain attempts of first-class bats to get Armstrong away to leg. McLaren did certainly time him accurately on more than one occasion, but he was the solitary exception, the others indulging in blind schoolboy swipes long after the ball had passed them. There was a time when Trumper seemed to be well set for one of his tremendous scores; all bowling came alike to him, and he was administering such punishment as only he is capable of doing. Jackson, however, put himself on to bowl, and with his very first ball got rid of our most dangerous opponent, amid a roar of applause. Oddly enough, retribution was in store, and in his second innings, Jackson himself was bowled first ball by Armstrong, whose previous delivery had put an end to McLaren's brilliant, if somewhat lucky, innings of 79. The Australians showed great judgment in running, and in this respect they were undoubtedly our superiors; they played a good plucky game, as they always do. I am inclined to think that such luck as there was went all our way, and there is every reason to expect that there will not be much advantage on either side when play is called for the final game.

ON THE GREEN.

THE people of the Royal St. George's Club of Sandwich are like the heathen, according to the Psalmist's description of them: they furiously rage together, all about the best manner of reconstruction and stretching out of the course, and whether anything eventually will be done seems still to lie on the knees of the gods. Meanwhile, the second course and club, of which Mr. Mallaby-Deeley appears the prime organiser, proceed to establish themselves as going concerns, and with the prospect of a good hotel, we may hope to find the conditions surrounding the golf more pleasant than we have found them at Sandwich in the good old days.

It would be too much to say of the professionals and others who took part in the open championship, that they, too, have raged likewise, but certainly some of them have grumbled more than a little at the catchy places in which the holes were placed for that championship at St. Andrews. It was known beforehand that the authorities would not like to see their justly-venerated course done in the low figures, in the neighbourhood of 70, in which it was prophesied that it probably would be; but there is a right and a wrong way of making courses more difficult, and the local authorities seem to have made both ways their own. They have dug very many side bunkers—all very good. One bunker at least they have made in the fairway of the course—also very good. And they stretched back the tees, which was very excellent. Not content with this, however, they had some of the holes very close to the bunker corners, not in the centre of the greens. The centre of the greens is the recognised place for the holes on medal days, and what is right for them ought to have been right for the open championship too. It was especially unnecessary to add to the difficulties and the trickinesses, when a very keen wind and very keen greens made the golf tricky enough already. All the new bunkers are fully justified, and even more bunkers still might be made with advantage, but whether two at least of the old ones might not be filled up, also with advantage, always has been rather an open question; these are the pot bunker just beyond the Principal's Nose bunkers going to the sixteenth hole, and Sutherland's bunker, which catches many a good tee shot, both to the fourth and the fifteenth holes. On the way to the ninth hole the little pot bunker might really well be made into a great big pot, but such classic features are only altered after many years, many words, and many tears.

Mr. Arthur Crosfield has won the championship of France, and I do not think that anyone could have a better right to gain it, for he has brought a great many good golfers into France, and done much to encourage the golf and the *entente cordiale* generally by the Hoylake teams that he has taken down to Cannes to encounter the team of the Grand Duke Michael. This championship was played at La Boulie, and also at L' Touquet there has been great golfing, so that France would appear to be educating herself satisfactorily in the golfing way that she should go. It has to be admitted, however, that at present a great majority of the players at all the French courses are English or American, and not native French.

The play at the Newquay professional tournament must have been fine, and certainly it was interesting. The players were the notable four, Braid, Vardon, Taylor, and Herd. At the beginning of play Braid held the record of the green with 70. In the morning round Vardon took this pride of place from him by going round in 69, and in the afternoon Braid replied by going one better again with 68. The conclusion of the matter on the first day was that Vardon scored 141, Braid 142, Taylor 146, and Herd 147. On the second day best-ball foursomes were played, with the result that Braid and Herd, representing Scotland, beat the two English players by 3 and 1, in the thirty-six holes; but the best of the best-ball rounds only equalled Braid's 68 on the day before.

The opening ceremony of the Bramshot Golf Club, near Fleet in Hampshire, is fixed for to-day. HORACE HUTCHINSON.

FOR TOWN AND COUNTRY.

THE merits of Plasmon are perhaps by this time too well known to need the remark that it is a food, and not a medicine, in that it raises the nutritive value of the food into which it is introduced as an adjunct. In the form of a creamy, soluble powder, it is superior to milk or meat, being a means of effectually supplying nourishment for both brain and body. Some additions have lately been made to the hundred and more excellent recipes given in the "Plasmon Cookery Book," including one for whipped cream (which is easily made with Plasmon), for use with tea, coffee, or fresh or stewed fruit, and for this purpose the Plasmon Company supply, post free, for 1s. 3d. a special wheel whisk, which produces the best results. The cookery book is sent (on application to International Plasmon, Limited, Farringdon Street, E.C.), post free, for two stamps.

No one is justified, in the light of the knowledge attained by science of the causes of disease, in neglecting the security which the habitual use of antiseptics in a house ensures for its inmates. Periodical flushings of all pipes and drains, floor washing with germ-killing soap, and the instruction of servants in the why and wherefore of such cleansing, are precautions it is criminal on the part of the head of a house to neglect. The cost is infinitesimal, the healthiness thus promoted of incalculable value. The proprietors of Izal, Messrs. Newton, Chambers, and Co., Limited, of Thorncliffe, near Sheffield, are able to point to a mass of medical, scientific, and popular evidence, all bearing witness to the value of this disinfectant in all its various forms—toilet soap, cream for the skin, tooth-powder—and as a preparation specially adapted for use at operations by medical men. Izal is an oil, one of the products of a coke oven. It is non-soluble in water, has a high boiling point, and is non-poisonous to higher forms of animal and human life, while a deadly foe to microbes and germs generally.

Another aid in the preservation of health is the possession of a good filter. Filters have proved in the past by no means reliable as safeguards when the water supply is not above suspicion. Still at times, especially when abroad, or in tropical countries, they may become a necessity, and then it will be a satisfaction to the user to know that he has taken all the precautions possible to procure a good one. The merits of the "Berkefeld" filter, manufactured by the Berkefeld Filter Company, Limited, of 121, Oxford Street, W., have been attested by English and German scientists alike, and this company claim for their filter that it is the best germ-proof one for practical purposes on the market. The filtering medium used is Kieselguhr, which, if we mistake not, is better known in this country as Fuller's earth, a substance long recognised as possessing valuable disinfecting qualities.

One of the most noticeable groups at the recent exhibition in the Temple Gardens was that from Messrs. Kelway and Son of Langport, and a glance through their "Manual of Horticulture for 1905" is a reminder of the enormous collection of flowers grown on those sunny Somersetshire slopes. At the present moment the pæonies are in full splendour, making brave masses of colour, and comprising a host of varieties raised in the nursery. Kelway's new Imperial pæonies form a splendid race of flowers, representing quite a fresh departure. The guard petals resemble a beautiful sheet of varied colouring, sometimes as dainty as the pink of the wild rose, sometimes a strong purple shade, and occasionally of purest white. One may compare the flowers of some of the varieties to water-lilies, so waxy in texture are the petals, and this means that the flowering season is more lasting than in the case of pæonies of the ordinary kinds. A coloured illustration of this very charming class forms the frontispiece to the "Manual," the varieties represented being Knight of the Thistle, crimson-purple; White Lady, pure white with orange centre; and Meteor Flight, pale pink. Within the next few weeks the delphiniums will be a mass of beautiful colouring, the dark and light blue varieties standing out conspicuously. It is no exaggeration to say that the delphiniums or perennial larkspurs of the Messrs. Kelway have given a fresh charm to the borders of the English garden, the plants sending up sheaves of bloom. In July and August, one might write of the pyrethrums raised by Messrs. Kelway, of the great variety of hardy plants, hollyhocks, gaillardias, dahlias, sweet peas, and a list too lengthy to enumerate. There is always something to see the year round at Langport, bright colour filling the many glass houses in winter, then the fine variety of the netted iris (I. reticulata major), in fragrant groups out of doors, to be followed by a galaxy of spring flowers. It is a great bulb nursery as well as a nursery of hardy plants, and fruits and vegetables in the best varieties, and perhaps it is when the gladioli are flowering in profusion that a visit is as well repaid as at almost any season of the year. We are looking forward to seeing the new forms of gladiolus Kelwayi in flower this year—the varieties of 1904-5. Aphrodite we well remember last year for its absolute purity, the segments showing no trace of colour. It has been well described as "the whitest gladiolus yet seen." There are few lovelier garden flowers than this white gladiolus. Dovedale, pink and white; King of Gladioli, a magnificent gladiolus, the colouring a soft, salmon rose, with white spot; Miss Zena Dare, creamy yellow, with carmine stripe, and Saltpetre, pink, are handsome flowers. The other groups of gladioli are also fully represented; indeed, this is the finest collection in the world. We strongly recommend Kelway's "Manual" for its lengthy descriptive lists of flowers, fruits, and vegetables, and plain practical hints to the beginner. At a meeting of the Royal Horticultural Society, held in their new hall on June 20th, Messrs. Kelway brought from their nurseries a beautiful lot of pæonies, delphiniums, and pyrethrums, and were awarded a silver medal for the group. It was indeed a gathering of flowers fully representative of the varieties grown at home. The pæonies, bearing large handsome blooms in numerous delicate shades of colour, the stately delphiniums of brightest blue, and the ever-welcome pyrethrums, most useful as cut flowers at this time of year, combined to make a display of early summer flowers that was worth going far to see. Those who plant these three subjects, all specialities with the Langport firm, cannot fail to have a border full of blossom in June.

HALL'S SANITARY WASHABLE

Made in 70 distinct colours.

In rich dark, as well as light shades.

DISTEMPER

HALL'S DISTEMPER produces fine decorative and artistic effects. It is cleaner, cheaper, and more artistic than wall paper, and does not fade or change colour. It is sold ready to mix with water, and is applied with a whitewash brush. It sets hard and does not blister or crack. Beware of inferior imitations.

Sample Shadecard and full particulars on application to SISSONS BROTHERS & CO., LTD., HULL. London Office, 199B, BOROUGH HIGH STREET, S.E.

You know the Blessing of Good Health

Yet, do you take the necessary step to ensure that your home is as free from disease germs as it is free from dirt?

Scrubbing and brushing will not alone protect against disease. You must properly disinfect if you would safeguard yourself against the specific microbes which are the real cause of infection.

Izal has earned a reputation as the Perfect Disinfectant because it instantly kills all germs in their local habitation, no matter what their virulence may be.

Izal is non-poisonous, economical, and has no unpleasant smell.

We have a capital little book by Dr. Andrew Wilson on the subject of Health. Send for a free copy to NEWTON, CHAMBERS & Co., Ltd., Thorncliffe, near Sheffield. (Dept. 30.)

IZAL

MODES AND MOODS

NOW that Ascot is over, everyone is back in town, and balls and dinner-parties are more rife than ever, the week of country air having apparently given an added zest to the hustle of town life in the season. It is, therefore, well to turn our thoughts to evening dresses once more, for the fabrics of which they are chiefly composed this season are so daintily delicate that the term of life of a fashionable evening frock is brief indeed, and new ones are constantly needed, to the joy of dressmakers, and the future despair of the husband when he has to "foot" the bill of the season's frocks. But with his future feelings I have nothing to do; and certainly as regards the present, any husband worthy of the honour he bears would feel a thrill of pride could he see his wife attired in the evening dress I am illustrating this week. It is that most indispensable item in a woman's wardrobe, a beautiful black dress for evening wear. The skirt is of black tulle or net, with a ring-spot design, made over soft black Liberty satin. The skirt is in four gathered flounces, each flounce trimmed and edged with crescents cut out in black velvet, those at the edge of the flounces being larger than those above. What little is to be seen of the bodice between the deep-pointed corselet of black velvet and the double ruche of white tulle that edges the bodice, is of gathered black tulle. Above the white tulle ruche is a tucker of white net embroidered in pearls; and the same embroidered net forms the upper part of the little sleeves, which are finished with flounces of white tulle. A silver ribbon divides the white tulle ruche across the bodice in front, and ends in a true-lover's knot, with a little cascade of tulle to meet the uprising point of the corselet; and the same ribbon is used in bands on the embroidered net sleeves. A slanting black osprey, and a white ostrich tip holding a knot of silver ribbon in the hair, repeat the note of the dress with charming finish and completeness. Another charming black dress I have seen was also in black tulle (which has been revived this year with great success after long languishing neglected), the plain full skirt embroidered with long lines, in fine black jet, which started upwards from a band of black velvet round the hem. The bodice was of the ever-becoming cross-over design, the full draperies from each shoulder being caught together with a big jet butterfly where they crossed; and the opening between was filled with a little chemisette of white chiffon drawn on a black velvet ribbon. Shaded opalescent effects of superimposed layers of chiffon are more the rage than ever; and really poetic effects of colouring are now achieved with these. A dress which was greatly admired at one of the big Ascot house-parties was composed of a foundation of softest white Liberty satin, over which came a veiling of pale blue chiffon, then one of mauve chiffon sewn with silver and diamond paillettes, while over this again was an outer skirt of palest pink mousseline de soie. The effect of this mingling of delicate colours, heightened by the gleam of the silver and diamonds under the outer film of pale pink, was exquisitely delicate and artistic. The low bodice preserved the same blend of tints, with a berthe of ivory lace adorned with raised floral embroideries in chiffon, sequins, and diamond paillettes; and the deep corselet belt was of blue, mauve, and pink soft satin in bands, which still further emphasised the lovely tender colours of the dress.

Weddings have been, and still are, happening nearly every day of this season, which has been remarkable for the number of couples who have plunged into matrimony. Now, all these couples are setting up housekeeping, and if the sweetness of the honeymoon is not to be wasted, they would do well to weigh the serious question of ways and means when they begin house-furnishing, or else their early married life will be soured by money difficulties and the consequent and inevitable irritation which so often destroys conjugal harmony. In the little booklet, "Business Methods Applied to Furnishing," which Messrs. Gillow and Co. have just brought out, the best of advice is given in these words, which are the text of the pamphlet, *àpropos* of the bitterness of exceeded

ORIGINAL DESIGN FOR A SIMPLE DINNER-GOWN.

estimates: "Why not start with the price? Sit down quietly and decide, before doing anything else, the amount of money you want to spend, and let that be the basis of your scheme." If this is done, the rest can be confided to this well-known firm, whose reputation is a sufficient guarantee of pure design and quality of materials; and they make a speciality of preparing designs, complete schemes, and estimates free of cost, showing exactly what they can do for the amount desired to be spent. Success in decoration and furnishing is not so much a matter of expenditure as of taste and judgment, and the experience gathered by this firm during its two centuries of existence is thus placed at the command of their clients with a minimum of trouble and expense. This most practical little booklet will be sent to anyone who applies for it to Messrs. Gillow and Co., 406, Oxford Street, and it should appeal to all business men.

Is there a woman with soul so dead to feminine joys whose heart does not leap at the magic words "Sale Catalogue," when she first sees them at this time of year? Later on these words of glorious possibilities may, perhaps, pall by much iteration; but the first promise of the annual summer sales fills every woman with joyous anticipation of bargains hitherto unattained, though perhaps often seen in visions. This year the promise of such bargains seems nearer fulfilment than ever, if one may judge by the catalogue of Messrs. Peter Robinson in Oxford Street, whose sale begins next Monday, July 3rd. The reductions in all departments have been unusually liberal, and I think that most women will be desirous of acquiring the "Henley" coat in cream and navy serges, with a contrasting collar in faced cloth, a most admirable and useful tailor-made garment, at the ridiculously low price of a guinea; or the "Sandown" alpaca dust-coat trimmed with fancy braid, and with comfortable loose cape sleeves, which is marked at the same price. These are the garments which are the very things required at this time of year, for the river, the seaside, or for travelling and driving, and such an opportunity should not be missed. Then there are charming costumes for both day and evening wear, notably the "Carlton," in the new crystalline silk trimmed with lace and velvet, and lined throughout with glacé silk, at 6½ guineas; and the "Windsor," a very smart afternoon dress of taffetas, chiffon, and lace, at 5 guineas; the charming series of blouses, absurdly cheap, and of which one can never have too many; and the ever-useful and smart sun-ray-pleated fancy check voile skirts, which are actually reduced to 19s. 11d. There are innumerable other things also illustrated in this remarkable catalogue which I have not space to mention; but those of my readers who cannot be present at the opening of the sale on Monday should write for the catalogue to Messrs. Peter Robinson in Oxford Street, and they will be astonished at the opportunities offered therein.

All women who respect their figures will be glad to hear that Messrs. Dickins and Jones (the makers of the famous "Spécialité Corsets") announce their sale for Monday next also. These corsets will be sold at reduced prices during the sale, and no one should lose this opportunity, for the "Spécialité" are made in so many different types, that every woman can be certain of being properly fitted therewith, to the improvement of her figure and her personal comfort. The corset department, however, though vastly important, is not by any means the only attraction at Messrs. Dickins and Jones's famous establishment in Regent Street. They are equally renowned for their costumes, their lace, tulle, and feather boas (which are such a marked feature of the dress of the moment), and their beautiful petticoats and underlinen. These, like everything else, have been wonderfully reduced in price, and a special note should be made of the hand-made lace robes, which are simply marvellous value at 58s. 6d., and especially desirable this year, when lace dresses are the rage at every fashionable gathering.

TABLE FOUNTAIN AT MESSRS. EDWARDS.

The hand-embroidered linen robes, too, are charming, and the most useful wear in the world, as they wash or clean like the proverbial handkerchief; and the robes in "broderie Anglaise" soft white lawn are most covetable possessions at the greatly-reduced price of 59s. 6d. Anyone who is going to the seaside, or up the river, should purchase one of Messrs. Dickins and Jones's soap-shrunk flannel costumes in various grey stripes, navy or black with white lines, or in cream with fine stripes of black and pale blue, which, with the beautifully-cut coat and skirt, are extraordinary value at 49s. 6d. Altogether, if one may judge by these two brilliant sales which begin on Monday next, this season's opportunities for acquiring those bargains so dear to the feminine heart seem likely to be more remarkable than ever before.

With dinner-parties crowding each other out every night at this season of the year, hostesses will be glad to hear of a dainty novelty which will certainly please their guests in hot weather. This charming novelty is the new and improved Table Fountain of Messrs. Edwards and Sons, 161, Regent Street, which makes the most decorative centre-piece to a dinner-table that it is possible to imagine, as may be gathered by the accompanying illustration. The fountain is constructed on pneumatic principles, and is so simple that it can be managed by anyone; and it has the great advantage that it can be prepared hours, or even days, before it is required to play, so that no decoration need be displaced. The appearance of the flower-laden bowl and the tinkling music of the falling water, as well as the coolness it brings, make the Edwards Table Fountain quite the most charming adjunct for a dining-room, drawing-room, or boudoir which could possibly be imagined.

The summer seems at last to have decided to remain with us, and not to be playing hide-and-seek with winter at our expense any longer; so we can now once more look forward to the delight of life in the garden, which is the real joy of the summer months. But that joy is not to be attained unless one can rest and bask in sunshine or shade at one's will; and a garden without seats or with too few of such resting-places is a garden shorn of one of its greatest charms. It is only given to hasty youth to enjoy sitting on the ground or grass (always more or less damp in this climate); the rest of us demand seats as appropriate in design to their surroundings as they are comfortable to the human form. Such a combination

may be found at Messrs. Maple's, who are making a new speciality of what they call, not inappropriately, "Garden Furniture" of all kinds. This "furniture" includes seats, sundials, pedestals, tables, fountains, garden tubs and pots, and beautiful reproductions of old French latticed arches which are so charming for pergolas and verandahs, and give such admirable foothold for climbing plants or plants that need support. The garden seats are particularly good in design, and remarkably inexpensive. They begin with the "Paxton" seat, 6ft. long, in either pale green or ivory (or in any colour or size to order) at £2 10s. 6d., and rise in price by a few shillings as the seats grow more ornate and elaborate, through a whole range of admirable designs to the "Ashridge," which appears on the illustration on a previous page. This seat is 9ft. long, and is shaped to fit in angle, and its price is five guineas, which is distinctly moderate for its beautiful design and workmanship. A very stately design is the "Melford," while the "Riseley's" severity of line would bring it into harmony with stone terraces and cut yew hedges. All those who desire to make their gardens both decorative and comfortable should write to Messrs. Maple for their illustrated catalogue of garden furniture.

There is nothing more trying to the complexion than the combination of hot sun and cold winds which we have had to endure lately, and I am, therefore, doing my readers a good turn in reminding them of the necessity of constantly using Dr. Dys's Sachets de Toilette and Sève Dermale. The daily and nightly use of these two invaluable toilet articles will not only preserve the skin from the evil effects of sudden changes of temperature, but will also keep freckles and sunburn at bay; and now that the boating season has brought Henley in view, this should be remembered. There is nothing so disastrous as the reflections from water glittering in sunlight to a tender, rose-leaf skin; and, though veils are some protection, they are somewhat stifling if thick enough to be of practical use. The constant use of the Sachets de Toilette and the Sève Dermale will obviate the use of veils, and all my readers who are wise will write for supplies to Dr. Dys's sole agent, V. Darsy, 54, Faubourg St. Honoré, Paris, who will also send particulars. LAMIA.

LITERARY NOTES.

VICTOR HUGO was not as other men. He was a man to whom, perhaps more truly than to any other, La Bruyère's description of a genius was applicable: sublime, isolated, too immense to be classified, shocking cramped and moderate minds which judge the things of to-day by the standards of yesterday, over-riding their rules, and arousing their resentment. His life began with a romance. As a child he had played with Adèle Foucher in that garden at Feuillantines; at eighteen, possessed only of the as yet unrecognised power to write good verses, he asked the hand of his playmate; met by a refusal from prudent parents, he persevered with ode after ode, until France awoke to his genius, and at twenty he married Adèle. This was in 1822; and for a few years all was tranquillity in the Hugo household. Four years later, just before the literature of France underwent that upheaval caused by the advent of Romanticism, a red-haired, awkward youth, who was walking the hospital, and reviewing books for the *Globe*, called on Victor Hugo in the Rue de Vaugirard. The visitor was none other than Sainte-Beuve, who had eulogised the "Orientales." "J'étais conquis dés ce jour," said the critic, "à la branche de l'école romantique dont il était le chef," and a friendship was formed. Sainte-Beuve then worshipped Hugo, and with Théophile Gautier, Lamartine, and Vigny, he formed part of the brilliant coterie which surrounded the newly-discovered star, and discussed the wonders of their newly-discovered literary universe. Then, calling a few years later, Sainte-Beuve discovered Mme. Victor Hugo *en déshabille*, "La robe tout d'un flot tombant jusqu'à ses pieds," and realised that he loved her. Thereafter, he wrote verses and dedications to her, and alternately praised and reviled her husband. Mme. Victor Hugo was *sans reproche*, but an element of discord had entered the family circle, and shortly after the poet was captivated by the charms of Juliette Drouet, mistress of many men, who was acting a part in Hugo's play, "Lucrezia Borgia." It is at this point that Mr. Henry Wellington Wack (*The Romance of Victor Hugo and Juliette Drouet.* Putman) takes up the story. The attachment he absurdly likens to that of Petrarch to Laura, of Abelard to Héloise, of Dante to Beatrice. With the letters from Victor Hugo to Juliette we are familiar. Mr. Wack has here given us the letters from Juliette, prefaced by a deal of matter which is not in the best of taste; and by an interesting introduction by M. François Coppée. M. Coppée relates an oft-repeated but characteristic incident of the poet. Conversation had turned on the immortality of the soul, in which Schoelcher, Victor Hugo's friend, disbelieved, and expressed his disbelief. "You are right, Schoelcher," said Hugo; "everyone is not immortal. One day Dante, having written two verses on a sheet of paper, went out for a little walk. Then the first verse said to the second: 'It is very nice to be a verse of Dante, for we are immortal.' The second verse in return replied: 'It is not at all sure; do you really believe we are both immortal?' Whereupon Dante returned, re-read his two verses, found the second worthless, and erased it."

A. G. Paterson. SUNLIGHT ON AN OLD PORCH. Copyright.

The Estate Nursery, by Mr. J. Simpson, is a handy little manual published by the County Gentlemen's Association, and treats of the practicability of having a tree nursery on every estate to supply its own wants more cheaply than can be done by buying. Much expense has been entailed in the past by treating the nursery as an odds and ends corner of the garden, which is a good point to make, for of all men gardeners are the most difficult to induce to take an interest in anything which they do not consider lies strictly within their province. The author considers no manure necessary as a rule beyond leaf-mould and a little lime, but a manured crop of potatoes can be taken off vacant plots from time to time if desired. An idea may be gained of his argument from the following figures: 15s. worth of Japanese larch seeds produce nearly 20,000 seedlings fit to transplant in two years, while to buy the same number of two year seedlings of this tree from the trade, £25 roughly would be needed, so that there is a good margin within which to economise on expenses of rent, planting, attention, and transplanting. A very practical hint or two is given as to this latter task. Dip the roots in a thick soil-puddle and plant wet, and remember that checking the growth in spring, by a process which Mr. Simpson describes, renders their transplanting in the autumn far safer.

Lord Byron was one of those men of letters who, whatever else might be said about him, had the gift of a great and interesting personality, and whatever chatter or gossip finds its way into print about him is sure to be read. Probably this was Mr. Bettany's reason for adopting so startling a title for his book as *The Confessions of Lord Byron* (Murray). The name never would lead anyone to expect what he will actually find between the covers, namely, a sort of analysis of Lord Byron's letters arranged in a kind of biographical order. We have different chapters headed "Byron's reflection on himself," "Byron's religious views," "Byron's opinions of the literary life," "Byron's estimate of contemporary English poets," and so forth. In one word, the letters of the distinguished poet are turned into gossip pure and simple. Nothing new is attempted, but

HUNTLEY & PALMERS "DESSERT WAFERS"

THE newest delicacy for lovers of good things. Light wafer biscuits of most refined flavour. Delightful with ices, sweets, or fruits. But a perfect dessert by themselves.

Elegant. Dainty. Pleasantly sweet. A triumph in fine biscuit making.

still it is curious to glance over Mr. Bettany's pages, and take some account of that singular man who, during the course of his short life, attracted all eyes, not only in his native country, but throughout Europe, and has still the reputation in Germany and France of being the greatest English poet of modern times. As a Scotchman, Lord Byron was naturally superstitious, and everybody knows the story of his riding over the Brig of Balgownie in spite of Thomas Rhymer's prophesy "Brig o' Balgownie wite is tha wa' wi' a wife's ae son wi a mear's ae foal doon tha shult fa'." He did this in revolt, as he did everything; but a great many people would not have attached so much importance to the old rhyme as to demonstrate that it was untrue. In one of his letters he confesses "I am superstitious," but there are very few instances given to prove the assertion. With regard to religion, the opinions of Byron are by this time well known, and here they are stated with his customary force, and also with an indecision that was no less characteristic of him. On the whole the book is interesting, and well repays the lover of Byron who cares to make his way through it.

Messrs. Routledge and Sons have issued a pretty edition of Coventry Patmore's poems, *The Angel in the House* and *The Victories of Love*, with the usual prefix by Mrs. Meynell. We do not think she quite explains how Coventry Patmore came to be so very popular at one time of his life, while now he has ceased to attract the younger generation of readers. If, however, we take the lines which Mrs. Meynell quotes as being the best in Patmore, it will, we think, be possible to see why his popularity is not a very abiding one. She calls the following wonderful and spacious:

"Alone, alone with sky and sea,
And her, the third simplicity."

But it really is fantastic. The implied likeness of a woman to sky and sea being really unthinkable, while the simplicity of a fine nature is by no means that of a landscape; nor, in truth, can we see "the dignity and awful tenderness" which Mrs. Meynell reads in this:

"His sorrow boasts a secret bliss
Which sorrow of itself beguiles;
And love in tears too noble is
For pity, save of Love in smiles."

How Mrs. Meynell holds forth may be seen from the following quotation: "Although the little ruled lines of the octosyllabic 'Angel' were to him not fetters but wings, yet the Odes flew on a larger and a nobler pinion."

GAME PROSPECTS IN SCOTLAND.

THE Scottish moorlands now present a very animated and busy scene, being tenanted by a capital assemblage of lively, strong, well-grown grouse chicks in the pink of health and condition. There is certainly no lack of numbers, and judging from reports I have received during the last month, quite apart from my own observations, the present "season" holds out expectations of excellent sport on the "Twelfth."

The weather at the commencement of the present nesting period was not of a very favourable character for egg-laying, particularly on the high elevations. An extremely cold atmosphere prevailed until well on in April, accompanied by frequent snow-falls, keen frost, and rain. Since then, although the air, especially during the early mornings, has been unseasonably chill, it has apparently done no harm, for the grouse is a hardy bird and suffers little from cold, but dislikes rain, and is restless when changeable weather occurs. Previous to the heavy fall of snow which took place last March, the large packs had broken up into smaller coveys and pairs. (In fact, a number of eggs were laid at that time, and in a few isolated cases nests containing a full complement of eggs were discovered.) The storm had the effect of causing the birds to reunite, and they packed again and betook themselves to the lower grounds. But birds which sat on eggs at that period, and which I had under observation, did not accompany these migratory flocks. They kept to their nests and eventually reared their broods. I have seen one of the birds almost covered with snow, using her wings at repeated intervals to shake the white mantle from off her back, and a point worth noting is that she every now and then turned round and round four or five times in the nest, apparently with the object of keeping the snow from encroaching on the structure. This snow-fall ceased as suddenly as it came, and a thaw set in which quickly cleared the exposed portions of the hills, and the packs which had been harbouring on the lowlands reappeared, and almost immediately broke up, dispersing all over the moors. It was not till then that nesting operations commenced in earnest, and what surprised me most of all at this time was the astonishing activity of the birds, and the exposed situations chosen by them for their nests. The nest (if it is worthy of that name) of the grouse is a mere depression or slight hollow in the ground lined with grass and a feather or two; sometimes it has neither, and I usually find them on the sloping sides of the moor, generally fairly well concealed. This year, however, the eggs were deposited in hastily-made hollows in all sorts of easily-located positions, and almost bare. Such casually chosen situations would appear to show how impatient the birds were to get forward with their incubation. This latter occurrence has been observed on almost all the grounds, and has caused some worry to many owing to the fact that the eggs were easily observed by vermin. In some districts carrion crows have been troublesome, and these birds (the most destructive foes the grouse-preserver has to reckon with) have had to be constantly watched, and hundreds have paid the death penalty in their over-eagerness to obtain the eggs. Their egg-sucking habits is proverbial, and their cunning marvellous. To judge from the avidity with which the young carrions suck out the eggs, the taste is very early acquired or, shall I say, inherited.

Two most satisfactory features of the present nesting season are, first, that the birds deposited full clutches of eggs which have hatched out with a very low percentage of infertile or unproductive specimens being left; and, second, no disease has been reported up to the date of inserting these notes. I must not omit to make mention that the food-crop—the heather or ling, the principal nourishment of the grouse—has sprouted beautifully, thanks to the rain which fell earlier in the year, and there is an abundance of tender, juicy shoots on which the "grouselings" love to feed. Heather-burning has been conducted with more than ordinary vigour on many of the moors this season, and these grounds will reap the benefit of this at a future date. I cannot lay too much stress on the importance of getting rid of old, matted, useless heather, which is neither good for the birds nor the ground on which it grows; there is little or no nourishment to be got from it, and, practically speaking, it is worthless, not to say injurious, to grouse, particularly to young birds.

Pheasants.

Wild pheasants are not up to the average by any means this year, a conspicuous feature on not a few of the estates showing a dearth of hen birds, which is a matter of much regret among rearers, particularly to those engaged on shoots known to give good sport not only in the number of brace but where the pheasants are characterised by being thoroughly wild and so affording the guns the best opportunities for showing their skill. Wild pheasants play an active part on such preserves, which is somewhat difficult to make up with hand-reared specimens unless the season is an unusually early one, which would allow the poults a chance of becoming thoroughly wild, and so provide the class of shooting expected on such beats.

Terrible accounts of the destruction caused by rats have been received. It would appear that never before have they taken toll of pheasants' eggs to such an extent as during this spring. Notwithstanding the means taken to destroy the pests they still increase at a perplexing rate. A note recently received from a practical game preserver says: "The common grey rat has given us more than usual worry this year owing to their habit of sucking pheasants' eggs. We have tried poisoning, trapping, shooting, ferreting, pouring tar down the holes, etc., to get rid of the brutes; but all to no purpose. We have lessened their numbers by 420 by six weeks' work; but still they come. I have found that pouring tar into the holes is pretty effective in clearing them out of certain burrows, but they scamper out and establish a lodgment elsewhere. They appear to have got firmly rooted here. It is impossible to accurately reckon the damage they do among the game, especially to the eggs and young of pheasants . . ." This speaks for itself. The remedy lies with the preservers. With the help of the owls much might be done. But where are they? I am not, I hope, narrow-minded on the subject of wild bird protection, and can listen to both sides of the question regarding the destruction of our birds of prey before I give an opinion; but to observe owls, birds which render great service to the gamekeeper by destroying large numbers of rats—they might very truthfully be named the keepers' night-watchmen—nailed to the vermin-board, makes my blood boil. This is a practice tending to the destruction of game—not to its preservation. Hand-reared pheasants are an excellent lot, and an inspection of the rearing-fields discloses the fact that eggs have hatched satisfactorily, the coops holding batches of strong, vigorous, and well-grown broods, consequently the decrease in the stock of the wild progeny will be freely met by the supply from the rearing-fields.

Partridges.

Partridges are fairly plentiful, and the birds, followed by the young broods, are now beginning to frequent the open grasslands. In some districts they are scarce, while in others they are reported as being in more than their usual numbers; but, taken all round, I do not think the year will prove more than an average one, even in the most favoured neighbourhoods. The coveys observed, however, are strong and well grown. Barren birds are in considerable numbers. Partridges have not got over the severe wet of 1903, which wrought incalculable damage to both the eggs and young.

Hares and Rabbits.

The agricultural districts are well stocked with hares, and it is many years since I have observed so many leverets; they are fat and plump, and in splendid condition. Rabbits abound on all the

BARNET ORTHO PLATES & BIRD PHOTOGRAPHY

Copy.

156, Sauchiehall Street, Glasgow,
May 9th, 1905.

Messrs. ELLIOTT & SONS, Ltd., Barnet.

Gentlemen,—With reference to my book of bird photographs, I have great satisfaction in stating that most of the negatives were made on Barnet plates, and since the introduction of the "Barnet Orthochromatic Plate" a new power has been placed in the hands of those who specialize in the photography of living wild birds. I have always found these plates of sufficient rapidity—even for focal plane work—giving good rendering of colour values without the use of a screen and in every way to be highly commended to the naturalist photographer.

Yours truly, (Signed) CHARLES KIRK.

REDFERN

The Annual Sale

WILL COMMENCE ON

MONDAY, JULY 3rd,

When the whole of the PARIS and LONDON Models, Millinery, Lingerie and Blouses will be disposed of.

A unique opportunity to obtain a . . REDFERN GOWN (suitable for the immediate season) at a nominal price, and Remnants of their noted Cloths and Silks at half cost.

Entrance for Sale: 26, CONDUIT STREET.

grounds, but a complaint or two exists that many are dying off with a disease known as spotted liver, a trouble caused by inbreeding.

WILDFOWL.

The wildfowl nesting season has been very encouraging, and capital sport is anticipated this coming fall. Wild ducks have reared large broods at their various breeding-grounds, and a splendid array of young birds inhabit the ponds and lochs. The moors are tenanted by a nice lot of curlew, golden plover, lapwings, etc., and wildfowlers may live in the hope of securing bags above the average when hostilities open. WILD MOORLAND.

CORRESPONDENCE.

SETTERS AND POINTERS RETRIEVING.

SIR,—The remarks in last week's issue concerning retrieving setters by Mr. Charles Boswell are interesting and instructive. When shooting quail last season in Florida, I found that nearly all the setters and pointers retrieved, and this extra duty seemed in no way to interfere with their ranging, nor with the locating of the birds. It also saved the necessity of carting about the ordinary retriever.—C. BERNEY BROWN.

SIR,—Mr. Charles Boswell's remarks in last week's "Shooting Notes" concerning retrieving setters and pointers were very interesting. I have often wondered why they were never used in this country. Retrieving setters and pointers are used all over the Eastern and Western States of America. I have now an Irish setter dog which I bred and shot over in California a few years ago. Two better all-round dogs than the father and son at ranging, retrieving on land or water, would be hard to find. A retrieving setter is very useful in the large duck-swamps, being able to wade in water when a spaniel has to swim. This makes a great deal of difference when one is pottering about in a swamp all day. I have used Irish setters for duck-shooting in Northern California in the winter, when it sometimes gets very cold, and I have seen them coated with ice and never stop retrieving; so this shows they can stand the cold. Of course, it is a much drier cold than in England. Setters and pointers, when broken to retrieve, are especially useful when quail (or partridge) shooting on the big ranges in Southern California. Dogs cannot range too far, and as there is hardly any scent in that dry climate, they gallop in and pick up a runner where a slow, pottering retriever would never find a runner in the dry heathery brush. Pointers are very good in the South, as they require less water, but do not make such good retrievers, and are not in the same class with a setter for duck-shooting, even in the warm southern climate of California. I think an Irish setter is a much hardier and keener dog than the English setter. A Scotch keeper once told me that the best retriever he ever saw in his life was an Irish setter broken to keep to heel. Irish setters always seem to work very jealous with other dogs if broken to retrieve. But there is one thing certain, that once a man has shot over a good all-round Irish setter, he will admit there is no gamer dog in existence.—VAQUERO.

HORSES AND PONIES AT RANELAGH.

ON Saturday last, in addition to the polo, there was the annual show of horses and ponies at Barn Elms. The show began with two classes, one for heavy and one for light weight ponies, which were won by Mr. Whitworth's Sermon and Mr. Roylance Court's Isaac, respectively. Of the latter I have often written, for there is no better or better-looking light-weight pony than he in England at the present time. In the class for pairs in harness, which always fills well at this show, the first prize went to Mr. E. H. Goad for the well-known dark chestnuts Lord and Lady Pickemup. The second and third pairs ran these very hard, and there were not wanting people who liked Sir Walter Gilbey's greys the best. However, as the judges were Colonel Maclean, Mr. Adrian Hope, and Mr. Romer Williams, the probability is that they were right. Judging horses is not one of those cases where lookers-on see most of the game. The Ranelagh members' class was won by that ever-fresh brown Marvel. Mr. Murray's pony is not badly named. In the open classes Sir Walter Gilbey's Society just beat Mr. E. H. Goad's Jersey Lily in ponies; while Lord Pickemup, well driven by Mr. Goad, beat Mrs. Hartley Batt's Diplomacy in the class for bay horses. This closed a very full and busy week, favoured by the best weather for polo we have had this season, and in which the intenseness of the heat in town caused a marked increase in the number of those who made the journey down to this delightful spot, there to enjoy the shade of the trees around the polo-ground, the pleasure of a dinner in "the country," and the cool freshness of the drive back afterwards. X.

THE AUTOMOBILE WORLD.

SOME weeks ago, when the outcry which ensued on the Markyate accident was at its height, we drew attention to the questionable methods by which a certain section of the daily Press was endeavouring to inflame public feeling. For a time at least every accident upon the highway, the cause of which was not immediately apparent, was attributed to the motor-car, and local reporters throughout the kingdom were allowed to draw upon their imaginations in order to swell the daily "motor peril" column to respectable proportions. The true facts, when they became known, were either ignored or given in some obscure corner of the paper, where they probably escaped the notice of nine out of ten of the persons who had read the original story, with its introduction of flaring headlines. Meanwhile the Automobile Club has been enquiring into the alleged instances of brutal behaviour on the part of motorists, and the chairman, Mr. Arthur Stanley, M.P., has narrated in a letter to the Press the result of these investigations. He quotes four typical cases, each of which received wide publicity in the newspapers, and caused even motorists to think that there must be more black sheep among their number than they imagined. The first was that of an old man who was found badly injured on the Great North Road. He was alleged to have stated that a motor-car had knocked him down and driven away. The Chief Constable of the county has informed the club that the man never said that he was knocked down by a car, and that there is no evidence that such was the fact. A similar case, described in exaggerated phrases, was reported to have occurred near Cowbridge. This was also found to be a pure invention, and the police have stated that they are satisfied that no motor passed through the place at the time. In a third instance, a lady cyclist was the alleged victim, who was left unconscious on the road by an inhuman motorist. Here again the police, as a result of their investigations, expressed themselves as satisfied that no motor-car was concerned in the accident. The fourth case was reported in the papers with a wealth of circumstantial evidence. An aged lady, walking with a deaf niece, heard a car approaching, and pulled her companion out of the way. The car struck the old lady and hurled her over a stone wall. The occupants, of course, drove off without rendering assistance. Another version of the story is given by the Chief Constable of the county, who writes to the club as follows: "I have to inform you that there is absolutely no truth whatever in the report. Mrs. —— did fall over a wall at Buxton, but no motor-car was in fault." Mr. Stanley states that many other similar cases could be cited. We ourselves will give one, taken from a Yorkshire paper, to complete the tale. A youth, who was found on the road with a broken arm, told the usual tale of a reckless motorist, who had knocked him down and left him to his fate. The police were apparently suspicious as to the truth of his story, and subsequently pressed him for details. He thereupon confessed that he had jumped on the rear of a car, and, unobserved, been carried to the next village. There, in attempting to alight, he fell, and broke his wrist. He admitted that the driver never knew that he was there, and was entirely ignorant of what had happened.

Mr. Stanley's letter demonstrates the wisdom of the recent decision of the Automobile Club to investigate every case where motorists are alleged to have acted in an inhuman manner, and to be represented, as far as possible, at all proceedings in which the conduct of motorists is in question. It may be impossible to correct entirely the unfortunate impression caused by an unfounded report in the newspapers, but much good can be done by presenting the actual facts to the public when they become known. There is another aspect of the chairman's letter which is worthy of consideration and acknowledgment by motorists. It shows that the police in various parts of the country have readily assisted the club in its endeavours to arrive at the truth; and what is even more satisfactory, it proves that the members of the force investigate every case upon its merits, without attaching credence to the idle stories invented by the sensational halfpenny Press.

THE AIX-LES-BAINS MEETING.
Baron de Rothschild on a Mercédès descending the Cole de Plainpalais.

HINTS FOR BEGINNERS.—IV.

THE least satisfactory portion of the average car, and the one that is the most frequent cause of involuntary stoppages, especially in the hands of a beginner, is the somewhat complicated apparatus by which the explosive charge is ignited in the cylinder at the commencement of every firing stroke of the piston. It is, therefore, of vital importance, if trouble is to be avoided, that the novice should gain a thorough understanding at the earliest opportunity of both the theory and practice of the particular form of ignition employed on his car. He may remain for months ignorant of the mysteries of the differential, the intricacies of the live axle, or even the construction of the clutch or change-speed gear, with comparative impunity; but unless he learns the why and wherefore of the vital spark that constitutes the very soul of his engine, he will speedily find himself stranded by the roadside, grinding uselessly at the starting handle, which brings no response from within the bonnet.

As a preliminary to the comprehension of any ignition system, it is necessary to have some idea of the properties of a current of electricity. Disregarding modern theories as to the nature of this form of energy, it is simplest and sufficiently accurate for our purpose to liken it to water flowing through a pipe. A given quantity of water may be passed through a pipe in two ways; one may have a low pressure, a large pipe and a slow current, or the same result may be obtained by a pipe of small bore, a high pressure and a swift current. In the same manner an electrical current may be of high pressure (or tension, as it is called), requiring only a thin wire to convey it, but a very strong insulation to prevent the current escaping; or it may be large in volume, but low in tension, requiring a thick wire, but only a comparatively thin insulation to contain it. A given "quantity" of electricity may, therefore, take the form either of a high-tension current small in volume, or of a low-tension current large in volume. I may now explain two electrical

THE INCOMPARABLE

"WHITE"

At the Bexhill Speed Trials on June 14th, 1905,

PROVED ITS SPEED.

In Class "C" a Standing Start Kilometre Race, with a stiff uphill finish, the **WHITE** made 34.50 M.P.H., **being better time than that made by** one 21-30-h.p. car, two 24-h.p. cars, two 18-24-h.p. cars, one 18-22-h.p. car, one 13-17-h.p. car, and several others.

In Class "H" **the WHITE won in better time** than any car in its class except one 30-40-h.p. car, although Class "H" included one 40-h.p. car and two 24-h.p. cars.

WHAT CAR AT A PRICE OF £550 COULD MAKE SUCH A SHOWING?

THE ROYAL

MERCÉDÈS

"The Kaiser's recent journey from Hanover to Hamburg, a distance of about 120 miles, was accomplished in about three hours and a half on his Mercédès. In the forest the Royal train, which had left Hanover shortly after the Kaiser, came in sight. His Majesty immediately gave orders to his chauffeur to quicken speed, and the Mercédès dashed forward at the rate of about 60 miles an hour. His Majesty enjoyed the sensation immensely, and was anxious to race the Royal train. He had long expressed a desire to see such a race, and had maintained that on a straight road the car would win. The race was entered upon with great zest, but owing to the curving of the road had to be abandoned."—*Daily Paper.*

terms in common use. The pressure or tension of an electrical current is measured in "volts." Its volume is computed in "ampères."

In most small cars and many large ones the necessary current is derived either from an accumulator in which electricity has been "stored," to use the popular term, or from a dry battery which actually generates the current in the first instance. The accumulator or dry battery, as used on a car, is only capable of giving off a low-tension current (about four volts) of comparatively large volume. Such a current is useless for ignition purposes, as it is quite incapable of jumping the gap between the points of the sparking plug in the cylinder. Before it can do this it must be converted from a low-tension to a high-tension current, and this is the function of the sparking coil, which forms an essential part of the ignition apparatus. The principle underlying the working of the coil is shortly as follows: If two wires are placed side by side without touching, and a current passed through one, at the moment that the circuit is completed in the first wire, a momentary current is "induced" in the other, only in the opposite direction. The same phenomenon occurs when the current is interrupted in the first wire, only that the induced current now takes an opposite direction to that followed on the first occasion. If both wires are insulated, and the first is wound round a bar of soft iron, and the second coiled outside it, the strength of the induced current is increased. The sparking, or induction, coil is therefore constructed on these lines. There is a core consisting of a bundle of soft iron wires, round which is wound several layers of comparatively stout insulated wire called the primary coil. Outside of this, and quite distinct from it, is the secondary winding, consisting of a very large number of layers of fine wire most carefully insulated. If the current from the accumulator or dry battery is caused to pass through the primary winding, at the moment the circuit is made or broken, a corresponding current of enormously high tension is induced in the secondary wire, the voltage depending largely upon the quickness of the make and break, and the number of layers in the secondary winding. It follows, therefore, that if one can rapidly make and break the primary circuit the result will be a high-voltage alternating current in the secondary, and one property of this current is that it will readily jump a gap interposed in its path. F. P. A.

LADY ALWYNE COMPTON'S CROSSLEY LANDAULETTE.

Motors in Hyde Park.

THE excuse put forward by the Office of Works for the recently-issued order excluding automobiles from Hyde Park between the hours of four and seven during the remainder of the season is of a particularly unconvincing nature. It is alleged that complaints have been made of reckless driving, and that the new regulation has been made in the interest of public safety. When one remembers that between the hours named the Park is thronged with carriages of every type, that a very large force of police is on duty, and that, as a rule, it is impossible for any vehicle to proceed above a walking pace, the absurdity of the allegation is manifest, and the police themselves will no doubt resent the implied suggestion that, in spite of their wide powers and long experience, they are incapable of regulating the traffic. The prohibition is an exceedingly serious matter to the very large number of London residents who have replaced their horses by electric, steam, or petrol driven carriages. It means that they are to be excluded from the Park during those fashionable hours of the day when they have been accustomed from time immemorial to seek relief amid pleasant surroundings from stuffy offices or crowded drawing-rooms. The parks are meant for all to use and enjoy, and it is monstrous that the electric carriage, the safest and most silent vehicle in existence, should be denied the rights which are granted to the far less innocuous horse. Some grounds of complaint may be found against the petrol car, which not infrequently is both noisy and odoriferous, but it is manifestly unjust that the innocent and guilty should suffer alike. The modern petrol car, if properly managed, is almost as devoid of offence as the electric carriage itself, and it would be easy to authorise the police on duty to order any automobile which by reason of smoke or excessive noise was causing inconvenience to others to leave the Park by the nearest gate. We have heard it suggested that among the offenders are persons of considerable influence, and that the police, on that account, have hesitated to take action. This, however, hardly seems a probable explanation of the drastic and arbitrary step taken by the Office of Works, as it is well known that regard for those in high authority has not prevented the police from summoning members of the Cabinet or their drivers for breaches of the speed limit.

Wolseley Motor-boats.

The marine motor department of the Wolseley Company is now in full operation, and we are able to reproduce a photograph of a 40ft. cabin launch nearing completion in one of the building sheds. Although the firm has only comparatively recently taken up the construction of motor-boats for pleasure purposes, it has had a unique experience in the building of petrol engines for marine purposes, as many of the huge motors employed in the British submarines have been supplied by the Wolseley Company. The standard motors are made in a range of sizes from 8 h.p. up to 250 h.p., the sizes up to 75 h.p. being for ordinary use. The latter has six cylinders, with a bore of 6in. and a stroke of 7in., and weighs, with fly-wheel, well under a ton. The smaller sizes, up to 24 h.p., follow the design of the Siddeley motor, the induction valves being placed above the exhausts and fitted with a variable lift. High-tension coil and accumulator ignition is fitted in all cases, but above 100 h.p. low-tension magneto is used in addition. High-tension magneto may be supplied in the place of the coil and accumulator system. The larger sizes, above 70 h.p., are started by an independent engine or by compressed air, supplied by a compressor driven by a small petrol motor. The reversing gear, which in the case of the sizes up to 24 h.p. is self-contained with the engine, is of the epicyclic type, the gears only coming into action when going astern, when the speed of the propeller is about half the engine speed. The standard hulls which have been designed are a 20ft. dinghy, 25ft. and 30ft. launches, and 35ft. and 40ft. cabin cruisers. The last mentioned, which is shown in the illustration, is 47ft. over all, with a beam of 9ft. and a draught of 3ft. 6in. The propelling mechanism consists of a four-cylinder 60 h.p. motor and reversing gear and a single screw. All the Wolseley boats are carvel built of mahogany, with scantlings of ample size for sea work.

A WOLSELEY MOTOR-BOAT.
A 40ft. cabin launch nearing completion in the building shed.

The Use of the Highways.

Perhaps one of the most interesting statements made at the Society of Motor Manufacturers' and Traders' dinner last week was that contained in a letter from Mr. Cathcart Wason, M.P., whose views, as expressed in the House of Commons, have certainly appeared decidedly hostile to automobilism. Having been invited, however, to the dinner referred to, he wrote a letter of regret for absence, in the course of which he stated that he had a firm belief in the future of the automobile industry, and anticipated that in a very short space of time thousands of expensive and overworked horses would be replaced by motors. Except for purposes of farming, war, and pleasure, he added, the day of the horse was over. After the dinner a discussion took place on "The Use of the Highways," and Mr. Henry Sturmey, in opening, remarked that no driver of any vehicle ought to allow less space in front of him than he could pull up in. It ought to be a rule that every user of the high road could go as fast as he liked if there was nothing in the road; but that if anything was in the way he ought to approach it at such a pace that he could pull up if

there was any possible chance of an accident. Corners should never be cut on the wrong side. The whole question of using the roads resolved itself into consideration for other road-users; in other words, they should drive as gentlemen. The pedestrian was one of the greatest nuisances on the roads. While all vehicles had to keep to a recognised rule of the road, he had no rule to observe, and was a chartered libertine. Where footpaths were provided, pedestrians should use the roads at their own risk. The drivers of heavy waggons and market carts were great sinners; they were constantly on the wrong side of the road. All road-users should give and take; but the great majority of other users of the road thought that the motorist was an interloper and had no right to the road at all. The Hon. Arthur Stanley, M.P., who followed, commented on the unfairness displayed by the newspapers towards automobilists. He believed that if they could solve the dust problem they would hear very little more of anti-automobile agitation. Major Lindsay Lloyd, dealing with the heavy-traffic problem, said that the roads were intended not for local, but for through traffic, and until they could get the Government to consider the through traffic, they would never have the roads properly constructed.

HENLEY REGATTA.

Motor-cars are likely to be much in evidence at the popular river fête which takes place on Tuesday, Wednesday, and Thursday in next week. Arrangements have been made to reserve a portion of Phyllis Court for members of the Automobile Club and their friends. No better position could be found for viewing the races, as the shady and pleasant grounds have a long frontage on the course near the winning-post. In order to reach the entrance to the club stand, members driving from London should keep straight on after crossing the bridge, and turn to the right at Bell Street. At the fork at the end of the town the road on the right to Marlow should be followed for 100yds. or so, when the entrance, marked by a lodge, will be found on the right-hand side. The admission tickets will be 12s. 6d. per day, or 25s. for the three days, if purchased before July 1st. No charge is made for storage of car. These tickets admit bearer to the Grand Stand enclosure, but not to a reserved seat. There will be luncheon marquees and cloakrooms in the grounds, and the House Department will supply luncheon-baskets from the club each day, and deliver them on the cars on the course.

CLIMBING A CHUTE.

An interesting demonstration of the hill-climbing capabilities of the medium-powered automobile was afforded at the Crystal Palace last week, when a 14 h.p. Mors ascended the water-chute. This has a gradient of one in four, and the fact needs to be pointed out that the question of engine-power is not the only factor in a situation of the kind. So acute is the angle of inclination that the grip of the tyres is very slight. The only reason, of course, why a car cannot climb up the side of a house is that there would be no adhesion between the tyres and the wall; then the point for consideration is at what angle nearest to the vertical can sufficient adhesion be obtained. It is clearly possible at one in four, for Mr. Carle, who drove the Mors, ascended the chute in first-class style. The car had first to be floated across the lake on a raft laid across two boats, and driven across a platform to the foot of the chute. A double line of planks had been laid up this to give the wheels a chance, but no other preparation for the feat was needed. At the signal to go, up went the car, smoothly and steadily, and without the slightest difficulty. A turn-table at the top, used for the boats, enabled the car to be turned round, and Mr. Carle then brought it down the formidable gradient with full command over its every movement throughout; in fact, he stopped midway and saluted the spectators. Had the brakes failed the car would of necessity have been precipitated into the lake.

SOME HINTS ON DRESS FOR LADY MOTORISTS.

A correspondent, whose experience extends over several years, writes as follows: "The extremely dusty weather of the last two or three months has made it more than usually difficult for ladies who indulge in motoring to clothe themselves suitably. For those who are only just taking up this delightful method of locomotion a few hints may be useful as to the best means of keeping comfortable, neat, and clean—a far from simple task when one is whirled from one fog of dust into another. The opponents of automobilism often speak as though the dust nuisance was one from which they alone suffered, whereas it is certainly a fact that motorists themselves are troubled by it to an equally great extent. We women are in worse case than the men in this respect, as they at least can dip their heads in a basin of water on arrival, and feel comparatively clean again,

TYRE TROUBLES ?

IN THE SCOTTISH RELIABILITY TRIALS.

In the Scottish Reliability Trials **20 cars broke down** owing to pneumatic tyre troubles, losing **over 12 hours** in less than four days only for repairs in the hands of experts with assistants, yet this loss of time was counted as a **non-stop.**

Let us quote for converting your wheels to these large comfortable High-speed.

SIRDAR-BUFFER TYRES

The "Motor News" says:—

"Nipped tubes are a constant source of trouble, especially to a beginner. The Sirdar air tube gets over this difficulty. It is vulcanised in a **U**-shape, so that when placed inside the cover it springs naturally into the crown of same, and so keeps clear of the edges of the cover, or the tools used for fitting purposes. It is essential however, that it should not be partially inflated when the cover is being replaced. These tubes are made, if anything, larger than the inside of the cover, and when inflated are compressed both laterally and longitudinally, instead of being stretched as the ordinary air tube is. They consequently afford great resistance to puncturing material."

Thousands of delighted users can be referred to.

but, on the other hand, the condition of our face-veils, after a run, testifies to the amount of dust which presumably the unfortunate 'mere man' has had to inhale.

"The first and most important requisite, then, for motoring, is a veil which will exclude the dust; and it must be confessed that, however becoming the gauzy draperies of chiffon and lisse may be, nothing but thin silk will really protect the hair. Japanese silk can now be obtained in many pretty pale shades, and, of course, washes splendidly. The form which is by far the most satisfactory (and though the directions may sound complicated it is quite simple to make at home) is to have two widths 1½yds. in length joined together, and gathered on to a straight band 3in. or 4in. long, which goes across the top of the hat. At the back of the neck, that is to say, about 18in. from the band, the centre of the silk should be cut away, leaving a width each side about 8in. broad to form the ends, which should be twisted right round the throat firmly, and tied in a bow in front. The cut edge across the back of the neck should be slightly 'fulled' into a band, and a little flat cape about 4in. wide sewn on to it; this is held firmly in place by the ends being brought over it, and prevents dust entering. The face-veil, of lisse or chiffon, should be sewn on to a band of the silk about 12in. wide and 6in. long, which should be gathered on the front side of the band which goes across the top of the hat. A ribbon should then be run through a hem at the bottom of the veil, and be tied round the neck before the silk ends are brought round. A little safety pin fastening the front edges of the silk to the hat-brim well forward, each side of the forehead, is an addition which makes both for comfort and tidiness, as otherwise the wind soon inflates the silk bag like a balloon, the edges get pushed away from the face, and dust drifts in between the veil and the silk.

"A small hat is, of course, a necessity, but a 'motor-cap,' so called, is not the ideal head-dress. It is often heavy, and the brim keeps the veil away from the head at the sides, while, when it has only a veil from under the crown (a form in which one often sees it), this latter blows up and down in a most aggravating and ludicrous way. A small toque, of boat, torpedo, or tricorne shape, with the sides going up from the face, is the most comfortable and becoming wear. One is very seldom too warm in a motor when actually driving, therefore tussore and linen dust-coats are for visiting or shopping expeditions only on real summer days, while for long runs a double-breasted tweed, with no capes to flap, but with collar and cuffs that close in cosily, will be found always serviceable; and a shade that inclines to warm beige rather than to bluish grey is best, as the cold tones get a rusty look from the dust, and fade easily. Short skirts are now so universal that it is not necessary to vaunt their merits for the purpose of motoring."

ONE OF THE BRITISH TEAM FOR THE GORDON BENNETT RACE.
The Wolseley which will be driven by Bianchi next Wednesday.

INTERNATIONAL MOTOR-CYCLE CUP.

The International Motor-cycle Cup Race, or "little Gordon Bennett," was brought off on the Dourdan Circuit on Sunday, and provided a very good and well-fought contest. The competitors numbered twelve in all, representing England, France, Germany, and Austria, three to each, as in the Gordon Bennett race. England was represented by Campbell on an Ariel, Collier on a Matchless, and Franklin on a J.A.P.; while the other contestants were as follows: France—Demester (Griffon), Giuppone (Peugeot), and Cissac (Peugeot); Germany—Müller (Progress), Genzel (Progress), and Jahn (Progress); and Austria—Toman (Laurin-Klément), Nikodem (Puch), and Wondrick (Laurin-Klément). Last year the race was won by Demester, who started first favourite on the present occasion. The course was 33¾ miles round, and had to be covered five times, with three controls in each circuit. It soon became evident that the issue lay between Demester and Wondrick, each of whom was making faster time than the remaining ten, while Giuppone was the likeliest candidate for third place. Of the English competitors, Collier and Franklin completed four rounds, and Campbell three. Nikodem also completed four, but none but the three first named made the five circuits. Wondrick's total net time was 3hr. 5min. 15sec., and Demester's 3hr. 13min. 2sec., while Giuppone took 3hr. 35min. 2sec. A protest was lodged against Demester, however, for having changed a wheel, and was upheld, his

disqualification giving Giuppone the second place, but not affecting the transference of the cup to Austria. The winner's average speed worked out at the extraordinarily high rate of 54½ miles an hour. The result is a blow to French pride, but was not altogether unexpected, as France has not by any means been so supreme in the matter of motor-cycle production as she has with cars. The winner deserved his success, as the Laurin-Klement is a machine that has done well on previous occasions.

An Inexpensive Touring Car.

On another page we illustrate a 10—12 h.p. two-cylinder Cupelle car fitted with a comfortable four-seated body, with side entrance through the front seat. At the time of the Islington Exhibition we commented favourably on the excellent appearance of these inexpensive vehicles, and we are now informed that the car illustrated has run from London to Oxford *viâ* Henley on the top speed. The 10—12 h.p. Cupelle is sold at £260 complete with lamps, tools, etc., and the fuel capacity is 150 miles at an average consumption of 25 miles to the gallon.

The Marine Motor Club.

The racing committee has drawn up a programme for this year which includes the following events: July 25th, races at Plymouth; August 1st, Eliminating Trials for the British International Cup off Bembridge; also open handicap for *bonâ fide* cruisers, first prize, £20; second prize, £10; third prize, £5. Also races for the 25ft. and 30ft. restricted M.M.A. classes. August 2nd and 3rd, Reliability Trials; August (probably the 8th) regatta on the occasion of the visit of the French Squadron; prizes to the value of £65 will be given in races for the same classes as at Bembridge. Last week in August, Windermere Regatta; races will be held for the 40ft. open racing class, and also for the 25ft. and 30ft. restricted M.M.A. classes, together with a handicap for *bonâ fide* cruisers; the value of the prizes will be £100. It is proposed to alter the title of the club to the "Motor Yacht Club."

The Gordon Bennett Race.

It may be of interest to those who intend to be present at the great race on Wednesday next, to give the distances and brief details of the chief routes to Clermont Ferrand from Paris and the leading ports of entry into France. From Calais to Paris is 165 miles, the road usually followed running through Boulogne, Montreuil, Abbeville, Beauvais, and St. Germain-en-Laye. From Paris to Clermont *viâ* Melun, Nemours, Montargis, Briare, Nevers, and Gannat, is 233 miles, making the total distance from Calais 398 miles. Paris may be avoided at the expense of about thirty-six extra miles by leaving the direct route at Beauvais, and making a detour through Gisors, Mantes, Chartres, Orleans, and Gien. Havre to Clermont *viâ* Paris is 368 miles, but Paris may be avoided by taking the Chartres road at Mantes, which involves an extra fifteen miles. Full details of these and other itineraries have been prepared by the Touring Department of the Automobile Club, and will be found in the issue of the *Journal* dated June 15th.

The course is reported to have suffered somewhat severely during the Eliminating Trials, but efforts are being made to restore the surface to a proper condition. The British competitors are practising daily on the course, and Mr. Rolls has expressed himself as agreeably surprised to find it less dangerous than he expected. The following is a list of the cars and their drivers who will take part in the race next week, arranged in their order of starting:

1. Théry (R.-Brasier), France.
2. Earp (Napier), England.
3. Jenatzy (Mercédès), Germany.
4. Lancia (Fiat), Italy.
5. Braun (Mercédès), Austria.
6. Lyttle (Pope-Toledo), U.S.A.
7. Caillois (R.-Brasier), France.
8. Rolls (Wolseley), England.
9. De Caters (Mercédès), Germany.
10. Cagno (Fiat), Italy.
11. Hyeronimus (Mercédès), Austria.
12. Dingley (Pope-Toledo), U.S.A.
13. Duray (De Diétrich), France.
14. Bianchi (Wolseley), England.
15. Werner (Mercédès), Germany.
16. Nazzari (Fiat), Italy.
17. Burton (Mercédès), Austria.
18. Tracy (Locomobile), U.S.A.

The Brighton Meeting.

The preliminary announcement in regard to the motor-races which will be held at Brighton on July 19th, 20th, 21st, and 22nd has now been issued. A novelty in the tourist events will be races for standard types of touring cars. A list of forty-two well-known cars is given, ranging from 6 h.p. up to 30 h.p., but no race will be arranged for any type unless six entries are received. There will also be races for touring cars classified according to their price, beginning with those which cost £200 or less, and ranging by steps of £100 each up to those of which the chassis price is over £800 and not more than £900. The racing events will include standing and flying mile races for cars weighing not more than 1,000 kilos., the car doing the best average time for three runs to be adjudged the winner. There will also be attempts on the flying kilomètre record, with the *Daily Mail* and *Autocar* cups as prizes, and several handicap sweepstakes for racing and touring cars which have competed in the previous events. The course is on the Madeira Walk, which has been entirely relaid with tar macadam at a considerable cost to the Brighton ratepayers, and good times should be accomplished. Entries, which will be received at the Automobile Club, close on Thursday, July 13th.

The Ladies' Automobile Club.

On Saturday last nearly sixty members and their friends visited Mrs. Gerard Leigh—one of the vice-presidents of the club—at her country home, Kidbrooke Park, Forest Row, Sussex. Some twenty cars in all made the journey, and we regret to learn that five of them were caught in a police trap set near East Grinstead. Among those present were Evelyn, Lady Allington, Lady Beatrice Rawson, Mrs. Corbet, Miss Antrobus, Muriel Countess De La Warr, Mrs. Herbert Lloyd, the Hon. Mrs. Corbet, Mrs. Manville, and Miss d'Esterre-Hughes, the secretary. A gymkhana will be held by the club at Ranelagh to-morrow (Saturday), and the next run will be on July 8th to Woodhurst, Crawley, the home of Lady Beatrice Rawson, and not, as previously announced, to Charlwood Park, Surrey.

Items.

We are informed that Mr. Frederic Eastmead has been successful in driving his 12 h.p. Sunbeam from John o' Groat's to Land's End, a distance of 882 miles, without a single engine stop. The performance is certified by

THE 'WESTBURY' COAT.

Specially adapted for SHOOTING, GOLFING, OR FISHING.

Invaluable to Sportsmen. Rainproof without Rubber. Is cut on a principle registered by us; gives complete freedom and ease in every position, is well-fitting and smart in appearance, and extremely comfortable.

Photographed from Life.

Gen. Sir FREDERICK CARRINGTON, K.C.B., K.C.M.G., writes us:—
"I consider the Westbury Shooting Suit you made me quite the most comfortable I have ever had. I think the coat is admirable."

Mr. WILLIE PARK writes:—
"THE WESTBURY GOLFING COAT you made for me is by far the most comfortable I have ever worn."

Mr. JAMES BRAID (open Champion, 1901 and 1905), writes :—
"THE WESTBURY GOLF COAT you made me allows absolute freedom to the arms when swinging, and is the most comfortable I have ever played in."

GARRICK STREET, LONDON, W.C.; and at 26 RUE BERGÈRE, PARIS.

the editor of the *Motor World*, who travelled on the car, and who states that during the entire journey the wheels never came to rest, except for the purpose of taking in fresh supplies of petrol and oil, meals, and rectifying tyre troubles; no attempt was made to secure a time record, the distance being covered in 47hr. 53min.

The Rev. H. B. Davies, who is well known as an enthusiastic motor-cyclist, proposes to undertake a private reliability trial in order to demonstrate the capabilities of the modern autocycle. He will make Oxford his head-quarters, and tour 200 miles every day for a week, visiting Taunton, Monmouth, Grantham, Derby, Bournemouth, and Shrewsbury. Mr. Davies will ride a 3 h.p. light-weight Triumph cycle with magneto ignition, and the load carried, including rider and kit, will be 15st.

A possible explanation of the dangerous craze, so prevalent among village children, for taking down the numbers of passing motor-cars may be found in the following request recently received by the London Motor Garage; "Please send particulars for collecting motor numbers, 1,000 for a bicycle. I have got a good many." Needless to say, neither the London Motor Garage, nor, to our knowledge, any other firm in the trade, has offered a prize for the collection of motor numbers, and in the interests of the safety of the children in the country parents and schoolmasters should make the fact known.

At the Aix-les-Bains Meeting, which commenced on June 20th and ends to-day, a 50 h.p. Mors, driven by Huillier, won the hill-climbing competition for cars with a cylinder capacity of from 3 litres 750 to 4 litres 500, with a 20 h.p. De Dion and a 24 h.p. De Diétrich second and third respectively. In the class for cars above 4 litres 500 cylinder capacity Baron de Rothschild, on a 60 h.p. Mercédès, was the winner. On another page we reproduce a photograph of Baron de Rothschild descending the Col de Plainpalais, the scene of the competition.

Mrs. Walker Munro has presented to the British Motor-boat Club a handsome challenge cup, which will be raced for in the Solent on August 7th on the occasion of the visit of the French club to this country. The donor has named the trophy the "Entente Cordiale" Cup.

The ninth number of the *White Bulletin*, an attractively-illustrated pamphlet issued periodically in the interests of the White steam car, contains the announcement that Mr. Thomas Edison has purchased two of these well-known vehicles. It would therefore appear that the faith of the great American inventor in the immediate prospects of the electric carriage is not so great as is sometimes supposed.

It is a pity that a greater number of makers do not realise the importance, both from their own point of view and that of their customers, of issuing instruction books, embodying the experience they have gained in handling their cars. In the majority of cases the novice is left to work out his own salvation after receiving a few vague directions from one of the firm's drivers, and the result is not conducive to the reputation of the maker in particular, or to the credit of motoring in general. The Duryea Company is amongst the manufacturers who issue a proper book of instruction, a copy of which we have recently received. It is written in the simplest and clearest language, and in conjunction with the "Book of the Duryea Power Carriage" should enable the beginner to obtain a complete knowledge of his machine. Apart from the technical matter, there are some useful hints on driving which do not apply necessarily to Duryea cars only. Copies may be obtained at 1s., post free, except in the case of owners of Duryeas, who, of course, are supplied with them free of charge.

ON THE GREEN.

ONLY this week it happened to me to have the far-too-long-delayed pleasure of playing golf at Huntercombe—delightfully breezy—on top of what I believe are called the Chiltern Hills, with views over a flat country round extending to many counties and all beautiful. The course is long and it is good—over 6,000yds. in length, and good because the lies are good, the putting greens are big and true, the bunkers abound and are well placed. There are many whins, too, of a thickness that should make them useful friends to the ball-makers. The soil is not exactly sandy, but there is evidence of sand in the bunkers, and there is evidence, too, of great skill in the laying out of the course. The skill, as is well known, is the tried skill of Willie Park, ex-champion, and to him every credit is due. It is against Huntercombe that it is so far from a railway station. Henley is, I think, the nearest, and that is seven miles away. But the road is a very good one, the main road to Oxford, and the scenery besides is very beautiful, while there are two motors that run golfers up and down from the station to the course and back again. I think among inland courses Huntercombe must be rather specially favoured, for it is said to play well both in the summer and winter alike. The explanation is that as it lies high with a light soil, it drains quickly and soon dries—this is the reason of its winter merit; and for its summer excellence, this is due in large degree to the fact that even in the rainless weather there is a very heavy dew at nights at this relatively high elevation, and the dew tends to help the growth of grass and prevent everything from becoming too hard-baked. A point in the arrangement of the course that may be noticed is the great width of the tees. It is a liberal scheme that allows one to take advantage of a slant of wind, or avoid its directly opposing force, unless quite dead ahead, and makes in the long run for an economy of turf, because all the hitting and standing is not done in the space of a few yards only, as is the case on tees of the common size.

E. LAZENBY & SON, Ltd., LONDON.

The win of the St. George's Cup by Mr. Harris was a very good one. It is seldom that the field is so strong in any but an amateur championship year. I mean that when the amateur championship is played at Sandwich it attracts all sorts of talent, and the players thus attracted take part in the St. George's Cup competitions, with the result that the meed of glory acquired by winning it in those years is very much larger than the measure of fame attached to its winning in the intervening years. But Mr. Harris's winning score of 154 never has been beaten, even in the great years. He fairly scattered his field, beating them all by five strokes. Mr. Worthington and Mr. Cecil Hutchison were next after him at this distance, they being equal at 159. Even so they were four strokes again in advance of Mr. Hilton, who was fourth. The weather was rather boisterous, too, so that altogether these scores of 76 and 78 represented very fine golf. In the second round Mr. Harris looked much like repeating his morning's score, but he tumbled (or his ball did) into the "Suez Canal"; he took seven to that, his one bad, hole, and the total "panned out" as has been said. Good work! It is a total that has never been beaten in this competition, but has been equalled once, by Mr. J. Graham. I am not sure whether Mr. Harris was entered for the Stock Exchange tournament (he is a member, I believe), but if he was entered he certainly did not survive to any of the final ties. However, the sad fact that champions are only human, and cannot always show champion form, is proved even by the ladies, for Miss Bertha Thompson, the lady champion, was beaten in the Yorkshire County tournament by Miss Robson, and even so Miss Robson was not the outright winner, but was beaten by Miss Steel in the final. HORACE HUTCHINSON.

PHYSICAL EDUCATION AND IMPROVEMENT.

THE social historian of a hundred years hence, when asking himself what was the religion of our day in England, will reply—physical fitness. To say so will not be to tell all the truth, but it will be to tell the greater part of it. For that, indeed, is the bond, the common aim, which unites all classes and creeds. Let men squabble as they will over the details of religious observance, the existence of a first cause or the future of the soul; they all come together in agreement on the importance, here and now, of the body.

It is surprising to realise how recently this conviction has been accepted. A hundred years ago, as everyone knows, lives were thrown away by thousands, by greed and cruelty in mines and factories, by carelessness and ignorance at home. But fifty years ago, or even less, the most favoured classes of the nation did not enjoy the advantages of those organised games and pastimes upon which we count nowadays so much for the formation of character; while as to all other classes, the stuff and substance of the people, they were still utterly neglected. The churches imagined that their duties stopped short at the soul; educational authorities thought only of school-hours and school-books; no manufacturer believed that his responsibility for the people in his employment went beyond paying them for work done; few doctors felt called upon to do more than order medicines for specific complaints, and get paid for them if they could.

The results we all know, or can all see without troubling even to go into the slums. The churches, the municipalities have woken up; great manufacturers build model villages and start cricket clubs; doctors begin at the other end, and aim at prevention before cure. And yet the infant mortality (to say nothing of still-births, which are not registered) is something like half the birth-rate; we cannot walk down the street or through the village without seeing stunted bodies and hang-dog faces, or enter a police-court without being shocked by the spectacle of criminals whose only fault is a perverted nervous system. All around is a frightful waste, and our efforts to stop it have done hitherto but a mere nothing. With a vast Empire to maintain, and a future history that should be as great as our past, we are still letting our most valuable material be thrown away with both hands.

For herein lies the urgency of our duty. By teaching mothers to bear and rear healthy children, by training those children to breathe deep and live cleanly, that when they come to be men and women they may give out the best that is in them, we are not only securing their own fitness, their own capacity for work and honest play. The duty is higher, and the need further reaching than that. First of all, the mere training in physical fitness reacts on character in a way that no school learning ever does. Lessons in the temperance and self-denial that keep the body fit are retained, even though a street accident may reduce the body to a broken, tortured mass. And, secondly, the advocates of physical training are playing for the future even more than for the present. Healthy parents make healthy children. To teach a mother how to feed her child may be to defeat the invader a hundred years hence; to persuade a youth to play cricket or swim, instead of lounging about the streets smoking cigarettes, may be to make his grandson a great inventor instead of a criminal; or, at the least, to produce a succession of happy, healthy men, instead of miserable, unhealthy half-men.

We know too much now to suppose that the healthy man is not, in nine cases out of ten, the happy man, and the happy man the efficient man. Body and mind are too closely inter-dependent for it to be otherwise. Genius, it is true, has laws of its own. It may be that in the peculiar relations of organism to environment that produce a great writer or a great artist, ill-health or bad habits may play a part; and we can afford to neglect the faddist who tells us that Tennyson would have written better poetry if he had

"LEA-FRANCIS" CYCLES

ARE NOW SUPPLIED TO ORDER FITTED WITH THE

"LEA-FRANCIS"

TWO-SPEED GEAR

(PATENT PENDING),

Combined with "Lea-Francis" Patent Clutch.

IN adapting a variable speed gear to the modern bicycle, one of the first decisions it is necessary to arrive at is as to whether the gear shall be combined with the hub or incorporated with the bottom bracket chain wheel.

There are many pros. and cons. in both directions, but on a balance of all the considerations involved, we are distinctly of opinion that it is less objectionable to combine the gear with the hub.

The "L.-F." variable gear is consequently a hub gear, and has the following special features:—

1.—It is "Lea-Francis" work throughout.
2.—It is extremely simple, effective, and light.
3.—It is dust-proof and OIL-RETAINING.
4.—The "LEA-FRANCIS" unique FREE-WHEEL CLUTCH is retained, and operates on either gear.
5.—The NORMAL, or high gear, is an absolutely DIRECT drive, and comes into operation automatically.
6.—The LOW gear is 23.8 per cent. less than the normal gear.

WRITE FOR DESCRIPTIVE CIRCULAR TO

LEA & FRANCIS, Ltd.,
COVENTRY, ENGLAND.

smoked less, and Goldsmith, Fielding, Byron, or De Quincey been greater yet had they lived more regular lives. Even the greatest men were, most of them, healthy men; and for the average citizen this physical health and the vast consequences it entails to his posterity and his race, should be the first objects of his solicitude.

Those were the objects touched upon by the Bishop of Ripon, General Sir Frederick Maurice, Sir Henry Craik, and Mr. Russell Wakefield at the inaugural dinner last Saturday of the National League for Physical Education and Improvement, which was duly founded at the Mansion House meeting on Wednesday. "Sanitas sanitatum, omnia sanitas," said Sir Henry Craik, who offered as the ideal of the league a mixture of ju-jitsu and bushido. The doctor and the teacher will join hands in the making of good citizens.

The aim of the league is not to displace, but to bring together, the many agencies, private and municipal, which have sprung into being during the last generation for the improvement of the national physique, and in this way to extend the work over the whole country, and supplement it where it is deficient. Each parish and town is to have one branch or more, the branches associated into districts, and the districts into boroughs or counties. A central bureau will be organised to supply advice and assistance. The scope of the league will embrace the whole subject of physical health and fitness; instruction to mothers, a work in which women members will be of the greatest value; the inspection of schools and training of children, games, exercises, drill, feeding and clothing, the provision of open spaces, and the enforcement of the sanitary laws. On the one hand, it will begin at the bottom with such working details as these; on the other, it will include the scientific bodies which collect facts on anthropology; and all its fellows, members, and associates will work together to remove the crying evils disclosed by the Manchester Jubilee Conference, and more recently by the report of the Departmental Committee.

KURRING-GAI CHASE.

THE State of New South Wales has not been slow in following the example of the United States in reserving extensive portions of its more beautiful lands for public use. It has established immense parks south and north of Sydney, the latter being known by the native name of Kurring-gai Chase. It is situated on the Hawkesbury river, within a few miles of the State metropolis, and is readily accessible by railway or steamer. It embraces an area of nearly fifty-eight square miles, the whole of the country remaining in its primitive wildness, including several of the inlets of the Hawkesbury nearest Broken Bay, a broad sheet of water capable of accommodating the navies of the world.

At present the greater portion of Kurring-gai Chase remains practically unexplored, and many of its most interesting features have yet to be named. In not a few places the shores are extremely precipitous and rugged, making the work, both of ascent and descent, difficult, and at times dangerous, even with the aid of an alpenstock. But the risk is worth encountering, for the scenery is everywhere of a most magnificent character. It is difficult to realise the fact that such a broad expanse of picturesque scenery should be found within an hour's ride of the New South Wales metropolis, but it shows how young and undeveloped the parent State yet remains.

A favourite resort of those frequenting the Chase is Cowan Creek, at the mouth of which there is abundance of fishing. From the summit of the lofty hills between which the waters of the creek tranquilly glide towards the Hawkesbury the view is extremely fine. "Hundreds of feet below," writes an enraptured visitor, "blue as turquoise, Cowan Creek nestles in dark green environing hills. It is sea blue in colour, as well it might be, for it is an eccentric arm of the sea which finds its way far into the bowels of the land, and anyone would naturally mistake it, from its length, for a fresh-water river." The stream during the upper part of its course, where it is fed from the surrounding heights, is perfectly fresh, while as it approaches the river it becomes salt. On these breezy hills, we are told, the draughts of fresh air to be inhaled are simply delicious. "Over miles of eucalyptus leaves a deep balsamic gale rushes up charged with the health-giving qualities that the old settlers found in the eucalyptus woods."

Cowan Creek is much frequented by fishing parties, being navigable for steam launches or row-boats for a distance of from seven to nine miles, while points along its shores form delightful camping grounds. Here and there the rocks bordering the creek are hollowed into large caves—veritable fairy retreats, inviting visitors to land and enjoy their cooling shade. Everywhere the eye dwells on lovely pictures of land and stream, tree and rock, fern and flower. The view of Cowan Creek is taken from near its mouth and looking down Jerusalem Bay, one of its numerous branches.

Lovett's Bay, situate on Pittwater, an immense lake-like arm of Broken Bay, is described as being one of the most charming picnicking spots in the State. "Nestling at the foot of a high range of hills, Lovett's Bay is a truly delightful retreat, and, protected by impenetrable masses of vines and creepers, Nature seems to have run riot, the growth of tree ferns and cabbage palms being among the finest within many miles of Sydney." Refuge Bay, an arm of Cowan Creek, possesses many picturesque features, and forms one of the happy hunting

grounds of Australian fern-collectors. At its head is a waterfall, which, during rainy seasons, presents a beautiful appearance. At Berowra, about midway on Cowan Creek, is a broad expanse of water known as the "Looking-glass," with a large rock, designated the "Toilet-table," rising from its midst.

All the glories, all the indescribable charms of the great Australian forest, are found concentrated in Kurring-gai Chase. Dainty ferns, stately rock lilies, gorgeous waratahs, masses of delicate maidenhair, and other beautiful plants abound; while in more sequestered recesses may be found the nest of the lyre-bird and other timid members of the feathered tribes. The place was a favourite camping ground of the aboriginals previous to the advent of the white man, and on the rocks overlooking Pittwater may yet be seen rude pictures of men and fish carved by them many generations ago. The reserve, of which Australians are justly proud, owes its existence to the present New South Wales Agent-General, Mr. Henry Copeland, who, when State Minister for Lands, proclaimed the whole area a national park.

CRICKET NOTES.

PRINCE EDWARD OF WALES celebrated his eleventh birthday by "captaining" the winning side in the match played between his eleven and the team which had his brother Prince Albert for captain. Although hardly to be classed under the head of first-class cricket, such a game as this can but make for the good not only of the young Princes themselves, but also for that of the national game of cricket wherever it is played. As to the style of the two young cricketers, Prince Edward appears to be likely, if time and opportunity are not wanting, to develop into a batsman of the type of Victor Trumper, and like that great cricketer is clearly of opinion that whenever possible a ball is to be hit and hit hard. Seventeen, not out, is by no means a bad score to have made on a first appearance in a real match. Prince Albert, on the other hand, adopts a sound and cautious style of batting, and took some time in compiling his nine runs; but he is even now by no means easy to get rid of, and shapes in a very promising fashion, and if his side were beaten it was only by the narrow margin of twelve runs, the final score being 104 for Prince Edward's side, and 92 for that of Prince Albert. We all hope that many bright and happy days in the cricket-field and elsewhere may be in store for both the young cricketers.

After a most remarkable game, which was full of excitement from start to finish, Essex succeeded in lowering the Australians' colours, and by so doing they have performed a feat which neither Lancashire nor Yorkshire was able to accomplish. That the honour is a great one no one will dispute, and it should make ample amends to Essex for her defeats in the County Championship matches. Buckenham and Tremlin, the Essex bowlers, must feel especially proud of the result of the game, and their splendid bowling takes one's memory back to 1899, when, thanks to Young and Mead, Essex beat Australia by 126 runs, the sailor-bowler taking eleven wickets for 74 runs. The Australians were giving a rest to Armstrong, Kelly, and Trumper, but this is a state of affairs that might very well obtain on other occasions, and it in no way detracts from the merit of the East Anglian eleven. For once in a way the Australian fielding was very slack, several fairly easy catches being missed in a most unaccountable fashion. As usual, however, they played a plucky game, Hopkins in particular making every effort to stave off defeat; but he could find no one to stay with him, and, when the end came, carried out his bat for 67, Essex winning a great game by nineteen runs.

C. B. Fry, who has scored his fifth great innings of the season, is at the head of the batting averages with 92·56 for nineteen innings and a total of 1,481, his highest score in an innings being 233, and he has been three times not out. Hirst comes next with eighteen innings, a total of 882 runs, and an average of 63. He has been not out on four occasions, and his highest score is 341. Then comes E. W. Mann, with an average of 59 and a total of 708 runs for thirteen innings. Quaife follows next, and for twenty-one innings, with a total of 850 runs, his average is 56·66, but it is only fair to remark that his great innings of 255 not out has gone some considerable way towards securing him his place in the list.

Kent are not doing at all well this season, and Bosanquet proved altogether too much for them in their match against Middlesex. The Australians have more than once had occasion to remember the deadly slows of the Middlesex bowler, and against Kent he was at his very worst, or best, eleven wickets falling to his insidious breaks for 121 runs. It was quite his day, for in the second innings his batting was almost on a par with his bowling, and his innings of 41 not out was a fine example of sound defence and clean hitting.

FOR TOWN & COUNTRY.

WITH July 1st holidays are not far distant, and in preparation for travellers to Scotland, the Midland Railway are putting on new dining and sleeping-cars, in which much care has been taken to ensure passengers to Glasgow or Stranraer a good night's sleep on the road, and, during the day, well-cooked and well-served meals. The exceptional width of 9ft. of the sleeping-car should be a distinct advantage, and the 1.30 p.m. to Glasgow and 8.30 p.m. to Stranraer will probably become favourite trains.

In July begin increased facilities on the railways for travellers to all parts, which will last throughout the summer. The London and North Western have additional corridor trains running to Scotland and Ireland (*via* Holyhead) not only from London, but also from Manchester, Birmingham, and Liverpool. This line is also running through trains direct, in connection with the Southern railways' systems, to South Coast watering-places, from Dover to Bournemouth, the convenience of which to passengers from Liverpool will be immense.

"Rapid Travel in Luxury" is the title of the Great Central Railway's summer time-table, and on looking into it it will be found that their services to most of the important towns in the Midlands and North have been considerably accelerated. This company also runs through trains direct to Southampton and Bournemouth, notably one from Scarborough to the former town *via* Banbury and Oxford, and they also connect with the Great Western Railway so as to reach the Devonshire and Cornish coasts.

The Great Northern Railway announce that they have arranged with the London and South Western Company for a through service between the North and the South Coast. For instance, passengers on arriving at King's Cross by the 8 a.m. train from Newcastle, can step into a train at the same platform and be conveyed to Southampton, Bournemouth, Weymouth, and the Isle of Wight without the trouble of crossing London, the total time from Newcastle to Southampton being under nine hours.

The cyclist who pays any attention to his own safety is very cautious as to how he reduces the weight of his machine, as he well knows this is too often only to be done at the expense of increased vibration, increased necessity for repairs, and the risk of a serious accident. However, a few pounds make such an enormous difference at the end of a long ride that provided he can trust the makers, he is generally willing, not to say, anxious, to do so. The Centaur Company have for some years been turning out their "Feather-weight" machines specially to cope with this demand, and claim to be giving the utmost attention to the quality and lightness of the materials used, and the workmanship with which they are put together.

More and more importance is a being attached, and rightly so, by medical men, owners of house property, and town councils to the procuring of a thoroughly reliable supply of water, but numerous and varied pollutions have to be guarded against, and at times with scant success. Rain water, that indispensable adjunct to the perfect bathroom, is especially hard to obtain pure, and when every other means has failed a filter becomes necessary. The Atkins Filter Engineering and Water Softening Company of 71, Southwark Bridge Road, London, S.E., make an especial feature of this apparatus for use in country houses, and claim that it will free water from soot, iron, animalculæ, and hardness, and this latter at the very moderate cost of ¼d. to ½d. per 1,000 gallons, while the largest plant, which they have lately erected, is capable of dealing with 100,000 gallons per hour.

We have received from the famous strawberry growers and raisers, Messrs. Laxton Brothers of Bedford, fruits of their new second early variety called Laxton's Bedford Champion, which has resulted from the following parentage—Scarlet Queen, John Ruskin, Noble, and Sir Joseph Paxton. We can trace the influence of the variety Noble in the size of the fruits, which is enormous, these often weighing no less than 2oz. in weight, with a circumference of 6in. It frequently happens, however, that size signifies a very poor flavour, and this we remember was especially so in one of the parents—Noble. The other varieties are excellent in flavour, Scarlet Queen in particular, and the result is that Bedford Champion is a big strawberry with a pleasantly brisk and acid flavour, which is very refreshing on a hot summer day. We are glad that Messrs. Laxton do not forget that the public want a good strawberry as well as a big one. No firm has accomplished more for the strawberry lover than Messrs. Laxton. We owe Royal Sovereign, the great strawberry of the day, to their skill as hybridisers, and The Laxton, Climax, Latest of All, and Renard have also come from their extensive seed-beds.
